SARGENT**Cylinder Entrance Door Locks for Handle and Thumb Piece Both Sides of Door**

Packed with screws to match

Safety Lock (Always Operative from Inside) with Janitor Control

No. 908 Heavy Lock with Guarded Latch Bolt—Latch bolt operative by thumb piece from inside at all times so that the door may be opened quickly in case of panic or fire. Latch bolt is also operative at all times by thumb piece from outside except when set from inside by key, when it is operative from outside only by key. Also has upper guarded latch bolt which works on the closed strike plate, automatically locking the regular latch bolt so as to prevent its being forced when door is closed. The inside cylinder allows janitor to set the outside thumb piece from the inside with Master Key without opening door, and outside thumb piece cannot be made operative except by Janitor Key from inside.

Made with double guard beveled bolt. These locks are handed but a right-hand

reverse bevel lock can be changed to a right-hand (only) by reversing the latch bolt, and a left-hand reverse bevel lock can be changed to a left-hand lock (only) by reversing the latch bolt. Otherwise these locks cannot be reversed.

Specify thickness of door and entrance door handles to be used with this lock.

Master Keyed—Can be furnished to order in sets of any required number with Master Key to pass each set, and a Grand Master Key to pass all.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Bolts and Strike: Bronze.

Cylinders: Bronze.

Keys: Nickel bronze.

Latch Construction: Easy spring: Easy on latch bolt.

Reversible: (See description.)

Master Keying: Yes.

No. 908

Lock No.	Front		Size case, in.	Backset, reg., in.	Strike, lip to center, in.	Cylinder	Keys	Latch bolt	Each
	Type	Size, in.							
908	Flat	7 3/4 x 1 1/4	5 1/2 x 3 3/4 x 7/8	2 1/4	1 1/4	2	Three, 267	Easy spring	\$17.00*

*For Master Keyed lock, add \$0.65 for each cylinder.

For Master Keyed lock and Grand Master Keyed, add \$1.00.

Locks Below Do Not Have Safety Feature or Janitor Control

No. 933 Heavy Entrance Door Lock, Dead Bolt Operative by Key Through Cylinders Both Sides—Designed for frequently-used entrance doors, as in stores, etc., kept closed by door closers and where latch bolt is not always necessary.

Latch bolt operative by thumb pieces from either side at all times unless it is held retracted by extra turn of key.

Dead bolt is operative from either side by key.

Master Keyed—Can be furnished to order in sets of any required number with Master Key to pass each set, and a Grand Master Key to pass all.

No. 933R—Similar to No. 933, except has rabbeted front.

No. 951 Has Dead Bolt and Stops in Face of Lock; One Cylinder—Latch bolt is operative by thumb piece of handle from either side except when outside thumb piece is set by stop in face of lock. Dead bolt is operative by key from outside and turn knob from inside.

Can also be furnished, at extra cost, so that the upper stop will hold the latch bolt retracted.

Master Keyed—Same as No. 933.

No. 933

No. 951R—Same as No. 951, except has rabbeted front.
No. 953—Same as No. 951, except has two cylinders, and dead bolt is operated from inside by key instead of turn knob.

Master Keyed—Same as No. 933.

No. 953R—Same as No. 953, except has rabbeted front.

Master Keyed—Same as No. 933.

No. 953 Special—Like No. 953, but with additional feature that latch bolt can be held back by pushing in the upper stop. This will permit our furnishing the lock so that at closing hours the outside thumb piece can be set by pushing in the lower stop, allowing no one to enter. With the arrangement to hold the latch bolt the door can be used with a door closer and it will have the same effect as a door equipped with a push plate on the inside and a door pull on the outside.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Bronze.

Bolts and Strike: Heavy bronze.

Turn Knob: Bronze (does not apply to Nos. 933 and 933R).

Cylinders: Bronze.

Keys: Nickel bronze.

Latch Construction: Easy spring: Easy on latch bolt.

Reversible: Flat front: Yes, by removing cap. Rabbeted front:

No; specify hand.

Specify thickness of door.

▲ Special backset 2 in., add \$3.00 extra.

SARGENT*Illustrations
One-quarter Size*

Union Lock Sets

Application

Template directions make the application of the Sargent Union Lock easy. The lock is set into the simple cut in the door stile.

Working Parts

The construction of the Sargent Union Lock is such that it is unnecessary to take it apart. All parts are carefully fitted (the steel parts cadmium plated), insuring perfect action and great durability.

Knobs

The knobs are firmly anchored to the lock frame so that they will not rattle, nor work loose, nor can they be stolen.

Latch Bolt

The Latch Bolt of all Union Locks, except the 9916 series, is of the hinged type, sometimes called swinging or car latch; it is easy in its action and operates without friction, thus permitting the easy closing of the door. The 9916 series is regularly made with a $\frac{3}{4}$ -in. throw anti-friction straight back latch bolt to meet the requirements of the Fire Underwriters.

Strikes

For Wooden Doors—A protected box strike as illustrated is furnished for all Union Locks that are to be attached to wood frames and doors.

For Steel or Iron Doors—A box strike as illustrated is furnished for all Union Locks that are to be attached to steel or iron frames and doors.

In ordering specify by "TMS" if wanted for steel or iron doors.

Cylinder

The cylinder mechanism, with pin tumbler security, is contained in the knob. Any of the modern keying combinations and systems, such as Master Key, Grand Master Key, are obtainable with these cylinders. In addition to this, Sargent Union Locks can be furnished with special demountable knobs and changeable cylinders.

Tenants' Keys

Three keys of the familiar and convenient grooved type are furnished with each lock for the use of the tenant.

Master Key and Grand Master Key

These locks may be mastered keyed in sets as required for the convenient operation of the building, with a master key for each set, or a group of sets, with a grand master key that will operate all the locks in all the sets.

Demountable Knob and Cylinder—Its Particular Advantage

Allows Changing of Cylinder System for Any Set of Union Locks by the Building Management

The illustration shows the operation of removing or replacing the Knob on a Sargent Union Lock with demountable knob and changeable cylinder with the release key. The lock does not have to be taken off the door. This is an exclusive Sargent feature of great importance to the management of large buildings. Tenant changes, loss of keys, or in other cases where the exclusive

another of an entirely different tenant key change—thus guaranteeing the key control of any lock.

control of a lock by known existing keys is doubted, make the changing of the cylinder of one lock or a series of locks imperative. This is simply and quickly accomplished by means of a release key (no tools required), permitting the cylinder to be removed and replaced with

SARGENT**Hand of Locks**

When Reversible Locks are not used, always specify the hand of the *lock* wanted—not the hand of the door. Beveled Front Locks and Rabbeted Locks are never reversible, except a few numbers as noted in the description of the locks.

The hand of a lock is determined from the outside of the door to which it is applied. The outside of a cupboard, bookcase, or closet door is the room side.

If, standing outside of a door, the butts are on the right, it takes a right-hand lock; if on the left, it takes a left-hand lock.

If, standing outside, the door opens from you, it takes a lock with a regular bevel latch bolt; if open-

ing toward you, it takes a lock with a reverse bevel latch bolt.

Designation

The following abbreviations are used to designate the hand and other items of Sargent Locks:

For Right Hand Lock	RH
For Left Hand Locks	LH
For Right Hand Reverse Bevel Locks	RHRB
For Left Hand Reverse Bevel Locks	LHRB

These designations follow the number of the lock, with a dash between, for example: No. 6845-RH, and for a rabbeted lock, No. 6845 R-RH.

**Outside**

Door opening from you, butts on left, takes a Left Hand Lock

**Outside**

Door opening from you, butts on right, takes a Right Hand Lock

**Outside**

Door opening toward you, butts on left, takes a Left Hand Reverse Bevel Lock

**Outside**

Door opening toward you, butts on right, takes a Right Hand Reverse Bevel Lock

Types of Spring Construction**Free Action Latch Bolt**

This illustration of Lock No. 5164 shows this type of construction

**Easy Spring**

Easy on latch bolt, extra heavy hub spring to hold up lever handles.
This illustration shows the type of construction used in Lock No. 5079

**Easy Spring**

Easy on latch bolt, firm on knob.
This illustration of Lock No. 5259 shows this type of construction

**Easy Spring, Two Compression Springs**

Easy on latch bolt, firm on knob.
This illustration of Lock No. 5639 shows this type of construction

SARGENT

Cylinder Knob Locks For Entrance Doors to Public Buildings

Illustrations
One-quarter Size

Packed with screws to match

The locks listed below are for use with knobs both sides.

For locks for use with Entrance Door Handles, see pages 30-31.

Extra Heavy Cylinder Front Door Locks

No. 6875 Extra Heavy Lock with Center Anti-friction Latch Bolt, Heavy Dead Bolt and Stops for Setting Outside Knob—The Anti-friction type latch bolt assures easy latch action and reduces wear on the latch. The latch bolt is operative from either side by knobs unless outside knob is made inoperative by lower stop in face of lock. The dead bolt is operated from the outside by key and inside by turn knob.

Note: Can also be furnished (at extra cost) with two cylinders so that dead bolt may be locked from inside by key instead of by turn knob.

Master Keyed—Can be furnished to order in sets of any required number, with Master Key to pass each set and a Grand Master Key to pass all.

Escutcheons Suitable—Escutcheons for 5½-in. Cylinder Locks are suitable for these locks.

No. 6875

No. 6875R—Same as No. 6875, except has rabbeted front.

Master Keyed—Same as No. 6875.

Escutcheons Suitable—Same as No. 6875.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Bolts and Strike: Heavy Bronze.

Cylinders: Bronze.

Turn Knob: Bronze.

Keys: Nickel bronze.

Hubs: Brass: Knob hub for ¾-in. swivel spindle; turn knob hub for ⅝-in. spindle.

Latch Construction: Easy spring, (easy on latch bolt, firm on knob), with center latch anti-friction.

Reversible: No; specify hand.

Master Keying: Yes.

*Furnished with special backsets 2 to 2¾ in. and 3½ to 6 in. at extra charge of \$6.00 each.

Cylinder Front Door Locks

No. 6845 Heavy Lock with Dead Bolt and with Knob Controlled by Stop in Face of Lock—Latch bolt operative from either side by knobs, except when outside knob is set by stop in face of lock. Dead bolt is operative by key from outside and by turn knob from inside.

Note: Can also be furnished (at extra cost) with two cylinders so that dead bolt may be locked from inside by key instead of by turn knob.

Auxiliary Springs—Can be furnished to order with auxiliary springs within the lock, for use with lever handles, at an additional charge of \$1.00 each.

Master Keyed—Can be furnished to order in sets of any required number, with Master Key to pass each set and a Grand Master Key to pass all. For Master Keyed Locks add 65¢ each cylinder. For

Master and Grand Master Keyed Locks, \$1.00 each cylinder.

No. 6845R—Same as No. 6845 except it has rabbeted front.

No. 6745—Same as No. 6845, except lighter lock but can also be furnished with two cylinders the same as No. 6845. Not furnished with Auxiliary Springs.

No. 6745R—Same as No. 6845R, except a lighter lock, and also has a rabbeted front.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze. No. 6845 has adjustable protected front, No. 6745 has front not adjustable, but beveled to order.

Bolts and Strike: Bronze.

Cylinders: Bronze.

Turn Knob: Bronze.

Keys: Nickel bronze.

Hubs: Brass: Knob hub for ¾-in. swivel spindle; turn knob hub for ⅝-in. spindle.

Latch Construction: Easy spring; easy on latch bolt, firm on knob; two compression springs.

Reversible: Flat front: yes, by removing cap; rabbeted front: no; specify hand.

Master Keying: Yes.

SARGENT**Cylinder Entrance Door Locks for Narrow Stile Doors**

Nos. 684 52 and 684 52½ for Use with Knobs Both Sides—The latch bolt is operative from either side by knobs except when outside knob is set by stop in face of lock.

The dead bolt is operated by key from outside and by turn knob from inside.

Note: These locks furnished, at extra cost, with two cylinders, so that the dead bolt may be thrown from inside by key instead of by turn knob.

Master Keyed—Can be furnished to order in sets of any required number, with Master Key to pass each set and a Grand Master Key to pass all. (Master Key No. 272.) For Master Keyed Locks add 65¢ each Cylinder. For Master and Grand Master Keyed Locks add \$1.00 each Cylinder.

Escutcheons Suitable—Outside of Door: Escutcheons for 5½ and 6-in. Cylinder Locks are suitable for use with these locks.

Inside of Door: Escutcheons having 6 in. between screw holes can be cut to fit these locks. If escutcheons in ornamental designs are desired, the same size must be used for the inside as for the outside. In ordering, specify the number of the escutcheon wanted and order it "cut to fit."

No. 684 51

No. 684 51 ½

Beveled to Order—No. 684 52½ can be furnished (not reversible) with beveled front.

Nos. 684 51 and 684 51½ for Use with Lever Handles and Cylinder Rosettes—Same as Nos. 684 52 and 684 52½, except they are operated by lever handles instead of knobs.

Master Keyed—Same as Nos. 684 52 and 684 52½.

Escutcheons Suitable—Same as Nos. 684 52 and 684 52½.

Heavy Hub Spring—The spring on the hub is made extra heavy to hold up lever handles.

Beveled to Order—No. 684 51 can be furnished (not reversible) with beveled front.

Nos. 684 51½R, 684 52R and 684 52½R—Same as Nos. 684 51½, 684 52 and 684 52½ respectively, except have rabbeted fronts.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Bolts and Strike: Heavy bronze.

Cylinders: Bronze.

Turn Knob: Bronze.

Keys: Nickel bronze. Three No. 267.

Hubs: Brass: Knob hub for ¾-in. swivel spindle; Turn knob hub for ⅝-in. spindle.

Latch Construction: Easy spring: Easy on latch bolt, extra firm on knob; two compression springs.

Reversible: No; specify hand.

Master Keying: Yes.

Specify thickness of door. Cannot be used on doors less than 1¾-in. thick.

Lock No.	Front		Case size, in.	Backset, reg., in.	Strike, lip to center, in.	Spacing, in.		Cylinders	Keys	Master keying	Turn knob	Latch bolt	Each

* ½-in. rabbet.

Two cylinders for all above numbers can be furnished at extra price so that the dead bolt may be also operated from the inside by key instead by turn knob.

Cylinder Vestibule Door Locks for Narrow Stile Doors

All the locks listed above for Narrow Stile Doors can be furnished without dead bolt for use on vestibule doors at the same prices as above.

In ordering, add Vestibule to the number: "684 51½ Vestibule," etc.

Locks with Standard Fronts and Composite Strikes

Following Recommendations of Bureau of Standards

Following the program adopted by the manufacturers of Builders' Hardware and the makers of Hollow Metal Doors and Bucks under the auspices of the Bureau of Standards, we are prepared to furnish the following locks with standard fronts 8x1¼ in. and with a composite strike:

951	961½	6816
951½	6805	6825
953	6805½	6826
961	6815	6830
6845	6851½	6859

6845½	6852	7805
6850	6852½	7805½
6851	6855	7816

In ordering any of the locks so furnished, it will be necessary to specify the size of front, in order to have the locks furnished with composite strike, as, for example: Lock No. 6850, 8x1¼ in. x strike No. 6850HM.

When furnished Master Keyed and Emergency Keyed, an additional charge will be made.

SARGENT**Cylinder Knob Locks***Illustrations
One-quarter Size***For Vestibule Doors or Corridor Doors to Offices***For Vestibule Doors with Narrow Stiles, see Page 41***Packed with screws to match**

No. 6845½ Lock with Deadlocked Latch Bolt—Latch bolt is operative from either side by knob, except when outside knob is set by stop in face of lock. Then operated from the outside by key. Has adjustable protected front. One cylinder. Can also be furnished to order with auxiliary spring within the lock for use with lever handles at an addition to list prices of \$1.00 each.

Master Keyed—Can be furnished to order in sets of any required number with Master Key to pass each set and a Grand Master Key to pass all. For Master Keyed Locks add 65¢ for each Cyl-

inder. For Master and Grand Master Keyed, add \$1.00.

No. 6845½R—Similar to No. 6845½, except has rabbeted front.

Master Keyed—Same as No. 6845½.

No. 6745½—Same as No. 6845½, except is a lighter lock and does not have adjustable protected front. Can be furnished (not reversible) with beveled front.

Master Keyed—Same as No. 6845½.

No. 6745½R—Same as No. 6745½, except has rabbeted front.

Master Keyed—Same as No. 6845½.

SARGENT

Cylinder Knob Locks for Front Doors or Corridor Doors to Offices

All packed with screws to match

Illustrations
One-quarter Size

Nos. 7805½ and 7805½R Are Also Suitable for Entrance Doors to Apartments

No. 7805½ Heavy Lock with Center Anti-friction Latch Bolt, Upper Guard Latch Bolt and Stops in Face of Lock for Setting—The Anti-friction Latch Bolt assures easy latch action and reduces wear on the latch. Latch bolt is operative from either side by knobs unless outside knob is set by lower stop in face of lock, then can only be operated by key from outside. Upper latch bolt, working on closed strike plate, automatically locks the regular latch bolt as well as stops in face of lock and prevents their being forced when door is closed. Beveled ½ in. in 2 in.

Dead-locking Stop—This lock has a dead-locking stop which is a desirable feature, especially on reverse bevel doors, making it impossible for anyone to push back the stop from the hall side and open the door with the knob.

Master Keyed—Can be furnished to order in sets of any required number, with Master Key to pass each set

and a Grand Master Key to pass all. For Master Keyed Locks add 65¢. For Grand Master Keyed Locks add \$1.00.

No. 7805½R—Same as No. 7805½, except has rabbeted front.

Master Keyed—Same as No. 7805½.

No. 7805—Similar to No. 7805½, but does not have guarded latch bolt. It does have a turn knob which dead-locks the Anti-friction latch bolt from inside against operation of both key and outside knob.

Master Keyed—Same as No. 7805½.

No. 7805R—Same as No. 7805, except has rabbeted front.

Master Keyed—Same as No. 7805½.

No. 7845½—Same as No. 7805½, except that it does not have the upper guarded latch bolt.

No. 7805½R—Same as No. 7805½, except has rabbeted front.

No. 7805½

No. 7805

*(See table at bottom of this page)

Locks with Dead Bolts

No. 6725 Has Protection of Dead Bolt Only—Latch bolt operative from either side at all times. Dead bolt operative from outside by key and from inside by turn knob.

Beveled Front to Order—Can be furnished (not reversible) with beveled front.

Master Keyed—Can be furnished to order in sets of any required number, with Master Key to pass each set and a Grand Master Key to pass all. For Master Keyed Locks add, for each Cylinder, 65¢. For Master and Grand Master Keyed Locks add \$1.00.

No. 6726—Same as No. 6725, except has two cylinders and dead bolt is operative by turn knob.

Master Keyed—Same as No. 6725.

No. 6725

GENERAL CONSTRUCTION

Case: Japanned.

Front: Bronze.

Bolts and Strike: Bronze, bolt ⅝-in. throw.

Cylinders: Bronze.

Turn Knob: Bronze (for Nos. 7805, 7805R, 6725 and 6726 only).

Keys: Nickel bronze.

Hubs: Brass: Knob hub for ⅜-in. swivel spindle. Turn knob hub for ⅝-in. spindle.

(Nos. 7805½ and 7805½R, 7845½, 7845½R have ⅜-in. swivel spindle only.)

Latch Construction: Easy spring: Easy on latch bolt, firm on knob; two compression springs. Center latch, anti-friction on Nos. 7805, 7805R, 7805½, 7805½R, 7845½ and 7845½R.

Reversible: No, specify hand (Nos. 7805, 7805R, 7805½, 7805½R, 7845½ and 7845½R). Yes, by removing cap (Nos. 6725 and 6726).

Master Keying: Yes.

SARGENT**Cylinder Mortise Dead Locks***Illustrations
One-quarter Size*

Packed with screws to match

These heavy locks are especially adapted for under Janitor control and ordinarily have no other Entrance Doors of Public Buildings, etc., which are means of locking.

Extra Heavy Especially Adapted for Entrance Doors of Public Buildings

No. 4886 Operated from One Side Only by Key—Heavy bronze dead bolt is made with two hardened steel rollers as illustrated. These, when attacked with a hack saw, revolve, making it impossible to cut off dead bolt. Has one cylinder.

No. 4886

Sectional View

For Tabulated Data, see Bottom of Page

No. 4887—Same construction as No. 4886, but operates from outside by key and from inside by turn knob No. 125.

No. 4888—Same as No. 4886, but operated from both sides by key. Has two cylinders.

Lighter Dead Locks with Standard Bolts

No. 4881 Operated from Outside by Key and Inside by Turn Knob—Has one cylinder.

No. 4885 Operated from Both Sides by Key—Has two cylinders.

No. 4871 Operated from Outside Only by Key—Similar to No. 4881, but has no turn knob. Has one cylinder.

No. 4861 Operated from Outside by Key, Inside by Turn Knob—A lighter lock than No. 4881. Has one cylinder.

No. 4861R—Similar to No. 4861, except has rabbeted front.

No. 4865 Operated from Both Sides by Key—Similar to No. 4861, except has two cylinders.

No. 4865R—Similar to No. 4865, except has rabbeted front.

No. 4851 Operated from Outside by Key Only—Similar to No. 4861. Has no turn knob, and one cylinder.

No. 4851R—Similar to No. 4851, except has rabbeted front.

No. 4802 for Very Thin Doors 1 $\frac{3}{8}$ in. and Thicker—Operated from outside by key, inside by turn knob.

No. 4803 for Class Room Doors in Schools—Can always be opened but never locked from inside. Similar to No. 4802, except the turn knob will retract dead bolt when thrown but will not throw same.

MASTER KEYING

Any of the above Locks can be furnished to order in sets of any required number, with Master Key to pass each and a Grand Master Key to pass all. For Master Keyed Locks add \$.65 each Cylinder. For Master Keyed and Grand Master Keyed Locks add \$1.00.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze. Nos. 4886, 4887 and 4888 have protected front.

Bolts and Strike: Heavy bronze. Nos. 4886, 4887 and 4888, extra heavy bronze and box strike 5 $\frac{1}{8}$ x1 $\frac{1}{2}$ in.

Cylinders: Bronze

Keys: Nickel Bronze.

Reversible: All flat front locks, yes; rabbeted front locks, no; specify hand.

Master Keying: Yes.

One-quarter Size

Generally used to give additional protection to existing lock service, pipe shafts, etc.

No. 4789x1620x30F with Guarded and 3/4-in. Long Throw Latch Bolt—For Underwriters' service on hollow metal and metal covered doors to pipe shafts. Latch bolt operated by key from outside and by turn knob inside, and held by stop in face of lock. Also has guarded latch bolt, working on the closed strike plate, which automatically locks the regular latch bolt and prevents its being forced from outside when door is closed.

Master Keyed—Can be furnished to order in sets of any required number, with Master Key to pass each set and a Grand Master Key to pass all. For Master Keyed Locks add 65¢ for each Cylinder. For Master Keyed and Grand Master Keyed Locks add \$1.00.

No. 4787x1620x30F—Similar to No. 4789, but has standard throw and the guarded latch bolt is above the regular latch bolt.

Cylinder Knob Lock Sets for Coupon Booth Doors

For Coupon Booth Door Holders, see Page 89

Packed with screws to match

These lock sets are designed especially for doors on coupon booths and afford complete control of booth by safe deposit officials.

Lock Set No. 99—Latch bolt is operative by key from outside of door at all times, and from inside by knob at all times. The inside knob also operates the indicator in outside knob when turned by person leaving booth.

The outside knob has a push button indicator which projects in the center of knob when booth is unoccupied. Attendant pushes the indicator in flush with the knob when it is to be occupied. The action of turning the inside knob to open the door projects the indicator again.

Inside of Door

Outside of Door

Lock Set No. 99

Master Keyed—Can be furnished to order in sets of any required number of Change Keys, with nickel bronze Master Key to pass each set, and a Grand Master Key to pass all. For Master Keyed Locks add, each cylinder, 65¢. For Master Keyed and Grand Master Keyed add \$1.00.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Cylinder Knob Locks For Hollow Metal and Kalamein Fire Doors to Stairways

*Illustrations
One-quarter Size*
Latch Bolt Has $\frac{3}{4}$ -in. Throw
For Latches Approved by Underwriters, see page 47
All packed with screws to match

These locks have extra long $\frac{3}{4}$ -in. throw for Metal and Metal Covered Doors to stairways, meeting latch bolt and are especially designed for Hollow the requirements of the Fire Underwriters.

Nos. 6827 and 6828 Have Dead Bolt Protection Only

No. 6827 Has Dead Bolt Protection Only—Latch bolt is operative by knobs from either side at all times. Dead bolt is operative by key from outside and turn knob from inside. One cylinder only.

Escutcheons Suitable—Escutcheons for $5\frac{1}{2}$ -in. locks are suitable for these locks.

Master Keyed—Can be furnished to order in sets of any required number with Master Key to pass each set, and a

No. 6827

See table at bottom of page

Grand Master Key to pass all. Master Key No. 272.

Master Keyed, add 65¢ for each cylinder. Master Keyed and Grand Master Keyed, add \$1.00 each.

No. 6828—Similar to No. 6827, except has two cylinders and the dead bolt is thrown by key through inside cylinder, instead of by turn knob.

Escutcheons Suitable—Same as No. 6827.

Master Keyed—Same as No. 6827.

Nos. 6808 and 6807 $\frac{1}{2}$ Have Upper Guarded Latch Bolt

No. 6808 Has Upper Guarded Latch Bolt—The long throw latch bolt is operative from either side by knobs unless outside knob is set by key in cylinder from inside, then can only be operated by key from outside. Operative from inside at all times. Upper latch bolt, working on closed strike, automatically locks the regular latch bolt and prevents its being forced when door is closed.

Escutcheons Suitable—Same as No. 6827.

Master Keyed—Same as No. 6827.

No. 6807 $\frac{1}{2}$ —Similar to No. 6808, but has stops in face of lock in place of inside cylinder and bottom stop will set outside knob when pushed in, making it inoperative.

Escutcheons Suitable—Same as No. 6827.

Master Keyed—Same as No. 6827.

No. 6808

GENERAL CONSTRUCTION

SARGENTIllustrations
One-quarter Size**Cylinder Knob Locks for School Houses**

Packed with Screws to Match

Safety Locks—Always Operative from Inside

These locks are operative from the inside at all times by the knob so that the door may be quickly opened in case of fire or panic. All the exterior doors may be locked by Master Key from the inside without going out, so that they cannot be entered from the outside without a key, but still can be operated from the inside by the knob.

The outside knob is made operative or inopera-

tive only by Master Key, assuring full control of doors.

The same feature is good for any place where it is desired to bar entrance after a certain hour, but permits those inside to go out at will.

Many communities require the use of Exit Devices on all Exit Doors. For complete line of this type of hardware, see pages 70-73.

Cylinder Knob Locks for Entrance or Corridor Doors

No. 7816 Heavy, High Grade Lock for Entrance Doors—Has center anti-friction latch bolt operative at all times by knob from inside and by knob from outside except when outside knob is set by Master Key from inside cylinder. Then the outside knob is not affected by key operating the latch bolt from outside and outside knob can only be released again by Master Key from inside.

Latch bolt is operative at all times by key from outside and by knob from inside. Latch bolt is also protected from forcing by the upper guard latch bolt which, working on the closed strike, automatically locks the regular latch bolt when the door is closed.

No. 7816

No. 6816—A high grade lock with same operation as No. 7816, except it does not have anti-friction latch bolt.

No. 6818—Similar to No. 6816, but does not have the upper guard latch bolt.

No. 6718—Similar to No. 6816, except it is a lighter lock for thin doors 1 3/8 in.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Bolts and Strike: Bronze. Nos. 7816, 6816 and 6818—heavy bronze.

Cylinders: Bronze.

Keys: Nickel bronze.

Hubs: Brass, for 3/8-in. swivel spindle.

Latch Construction: Easy spring; easy on latch bolt, firm on knob. Two compression springs.

Reversible: No; specify hand. No. 6718—Yes, by removing cap. Can be furnished to order (not reversible) with beveled front.

Master Keying: Yes.

For Grand Master Keyed, add \$1.00 each cylinder.

SARGENTIllustrations
One-quarter Size**Locks for School Houses****Bitted Key Locks for Class Room Doors Opening Out****Always Operative from Inside**

All packed with screws to match

These locks are operative from the inside at all times, and are especially designed for doors to corridor from class rooms.

They may be locked from corridor side by teacher or janitor, but anyone on inside can always come out but cannot re-enter after closing the door.

No. 4736 Heavy Bitted Key Lock with Upper Guard Latch Bolt—Latch bolt operative by knob from inside at all times, and by knob from outside when upper guard latch bolt and lower latch are locked backed by key from either side. When released by key, upper guard latch bolt, working on the closed strike plate, automatically locks the regular latch bolt, and makes the outside knob stationary.

Master Keyed (Class A)—Can be furnished in one set of 800 locks (or less), all different, with Master Key to pass. Can also be furnished in sets as desired (every lock different), with Master Key for each set, and with a Grand Master Key to pass the whole 800 locks when desired. Can also be Master Keyed in sets with all other three and four tumbler locks in Class A. For Master Keyed Locks add 40¢ each.

Escutcheons Suitable—Escutcheons having 6 in. between the screw holes can be cut out to fit these locks. In ordering, specify the number of the escutcheon wanted and order it "cut to fit."

No. 4735—This lock is the same as No. 4736 except that the latch bolt and auxiliary bolt will both be drawn back and held by the same key action that now draws back and holds the auxiliary bolt.

Especially designed for class room doors opening "in" or "out" and to be used in connection with a door closer.

When the auxiliary latch and latch bolt are drawn back by the key and held in the retracted position, the door can be operated as a push and pull door.

No. 4737 Lock with Recessed Face and Latch Bolt Instead of the Upper Guard Latch Bolt—The recess face prevents the latch from being forced from the outside by an instrument. The latch bolt is operative from the inside at all times by the knob, and outside by knob, except when knob is locked by key from either side.

Can be furnished only with Reverse Bevel.

Master Keyed (Class A)—Same as No. 4736.

Escutcheons Suitable—Same as No. 4736.

Locks, Latches and Dead Locks for Hospitals and Asylums

For Other Hospital Hardware, see Page 80

Mortise Bitted Key Hospital Lock Sets

"No Click" Noiseless Operation

Set No. 498—
This set consists of lock, lever handles and key plate complete for one door, made up as follows:

One Lock No. 4984— $4\frac{3}{4} \times 3\frac{1}{2}$ in., described below.

One Lever Handle No. 1153, $3\frac{3}{8}$ in., Rose No. 164 $\frac{1}{2}$ for outside of door.

Lock Set No. 498

One Lever Handle No. 1159, $2\frac{1}{2}$ in., Rose No. 164 $\frac{1}{2}$ for inside of door.

One Key Plate No. 810, $1\frac{3}{4} \times 1\frac{1}{4}$ in., for outside of door.

For complete description of lock, strikes and keying, see detailed description below.

No. 498, per set, \$11.00.

Mortise Hospital Locks

"No Click" Noiseless Operation

Key Hole Above the Lever Handle or Knob

*This Lock is used in set illustrated above**Packed with screws to match*

Lock No. 4984—Heavy lock designed especially for this purpose. The dead bolt is operative from either side by lever handles or knobs, unless the dead bolt is locked by key, making handles or knobs inoperative.

The strike is made with a spring box which allows the dead bolt to enter with a "no click" noiseless operation.

Keying—Locks are generally used with same Change Key for all doors, with small number of keys for all locks.

Master Keyed (Class B)—Can also be furnished in sets with all other Class B locks.

No. 4984

Escutcheons—Escutcheons having 6 in. between the screw holes can be "cut to fit." In ordering, specify the number of the escutcheon wanted and order it "cut to fit."

GENERAL CONSTRUCTION

Case: Japanned.

Mortise Asylum Latches, Extra Heavy
For Doors from Rooms to CorridorsIllustrations
One-quarter Size

No. 4732 Heavy Latch with Heavy Latch Bolt and Lower Guard Latch Bolt—Latch bolt operative from either side by knobs except when deadlocked by key from either side. Can always be operated by key from inside. Lower latch bolt, working on closed strike plate, automatically locks the regular latch bolt, preventing its being forced back when door is closed.

Master Keyed (Class B).

Escutcheons—Any of our escutcheons suitable for 3½ and 4¼-in. locks can be cut to fit these locks. In ordering, specify the number of the escutcheon wanted, and order it "cut to fit."

No. 4730 Extra Heavy with Recessed Face and Latch Bolt—The recessed face and projecting box strike prevents the latch bolt from being forced back. Latch bolt operated from either side by knob, except when deadlocked by key from the inside. Has three tumblers.

Master Keyed (Class A).

Escutcheons—Same as for No. 4732.

No. 4731—Same as No. 4730, except has four tumblers and more changes and Master Keyed Class B.

Master Keyed (Class B).

Escutcheons—Same as No. 4732.

No. 5656½ Extra Heavy with Latch Bolt Operated by Key Only—Latch bolt operative from either side of door by key only; the knobs being stationary. The door is always locked when closed.

Master Keyed (Class B).**GENERAL CONSTRUCTION**

Front: Cast bronze.

Case: Japanned.

Tumblers: Wrought steel.

Bolts and Strike: Heavy bronze.

Latch Bolt: No. 5656½—Easy spring: Easy on latch bolt, firm on knob.

Hub: Brass, for ⅝-in. straight spindle.

Reversible: No. 5656½—Yes, by removing cap. Others—No, specify hand.

Key: Nickel plated steel.

Master Keying: Yes.

†Prices are for locks without keys, as number of keys desired for groups of locks vary. These prices may be obtained by adding the price of the lock to the price of the quantity of keys desired with each group of locks. No. 979 keys are \$0.38 each.

SARGENT**Cylinder Hotel Locks**

Packed with screws to match

Illustrations
One-quarter Size**Key Arrangement**

Guest Key—Operates only one Lock, and that when not locked on the inside. Three Guest Keys are supplied with each Lock.

Master or Floor Key—Operates the Locks on all room doors of a floor, when not locked on the inside. Designed for the use of the maid.

Grand Master Key—Operates the locks on all room doors in the hotel when not locked on the inside.

Emergency Key—Operates all locks on all room doors in the hotel from the outside, even when locked from the inside. This key is designed exclusively for the owner or manager, and is kept in a secure place, accessible only

to them, for use only in case of great necessity, such as fire, sickness, suicide or other unusual occurrence in the room. The Emergency Key can also be used as a "shut-out Key," locking the door so that it cannot be opened by either the Guest Key, Master Key or Grand Master Key.

Display Key—Can be furnished to order with Display Key which will lock the door against all keys except the Emergency Key. This Key is designed for a room in which there is a display of samples or merchandise and enables the salesman, or owner of the goods displayed, to lock the room against the maid or housekeeper during his absence.

Cylinder Locks for Hotel Corridor Doors

With Locks Nos. 6851, 6852, 6851½ and 6852½ Doors Are Automatically Locked When Closed

No. 6851 Has Double Protection of Guarded Latch Bolt and Dead Bolt—This lock guarantees absolute privacy to guest when dead bolt is thrown from inside. Outside knob is stationary at all times. Closing the door locks the latch bolt by means of upper latch bolt working on the closed strike-plate, and prevents forcing of latch bolt. Latch bolt is operative from inside by knob at all times but only by key from outside.

When dead bolt is thrown from inside by turn knob, it can only be operated through outside cylinder by Emergency Key, and any other key will turn freely in the cylinders without operating the bolt or injuring the lock. The lock is operative from inside at all times, whether locked from outside or not, and door can be quickly opened in case of fire or emergency.

Master Keyed—See below.

Indicators Suitable—Hotel Lock Indicators Nos. 8, 9, 11, 12, 13, 14 and 110 are suitable for use with these locks. These indicators have a button that cannot be pushed in when door is locked from inside, thus indicating that the room is occupied.

No. 6852—Same features as No. 6851, except that it has two cylinders instead of one cylinder and thumb piece. from inside by key instead of by turn knob. Key cannot

be removed from inside cylinder when dead lock is thrown.

No. 6851½ Has Double Protection of Guarded and Dead Locked Latch Bolt—This lock affords protection similar to Nos. 6851 and 6852, but does not have a dead bolt, the latch bolt being dead locked by turn knob from inside instead.

Outside knob is stationary at all times. Closing the door locks the latch bolt by means of upper latch working on the closed strike plate and prevents forcing of latch bolt. Latch bolt is operative from the inside by knob at all times but only by key from outside.

When the latch bolt is dead locked by turn knob from inside, all keys, except Emergency Key, are inoperative from the outside and will turn freely in the cylinder without operating the latch bolt or injuring the lock in any way. The lock is operative from inside at all times, whether locked from outside or not, and door can be quickly opened in case of fire or emergency.

Master Keyed—See below.

Indicators Suitable—Same as for Nos. 6851 and 6852.
No. 6852½—Same features as No. 6851½, except that it has two cylinders instead of one cylinder and thumb piece. The inside cylinder, operated by key, dead locks the latch bolt and key cannot be removed while it is dead locked.

Nos. 6851 and 6852

MASTER KEYING

Master Keyed with Master Key, Grand Master Key and Emergency Key. Can be furnished in sets of any required number, with Master Key for each set, and with a Grand Master Key and an Emergency Key to pass all.

Can also be Master Keyed in sets with all other Cylinder Locks.

The price of the Lock includes all Key Functions.

GENERAL CONSTRUCTION

SARGENT**Cylinder Locks for Hotel Corridor Doors***Illustrations
One-quarter Size*

All packed with screws to match

With Locks Nos. 6850 and 6850x2, Doors When Closed Are Automatically Deadlocked*For Key Arrangement, see Page 53*

No. 6850 Has Protection of Fixed Outside Knob and Dead Bolt—This lock guarantees absolute privacy to guest when dead bolt is thrown from inside. Outside knob is stationary at all times. Closing the door automatically locks it and latch bolt can only be operated by key from outside but by knob from inside at all times.

When dead bolt is thrown by turn knob from inside, it can only be operated through the outside cylinder by the Emergency Key and any other key will turn freely in the cylinder without operating the bolt or injuring the lock. The lock is operative from inside at all times, whether locked from outside or not, and door can be quickly opened in case of fire or emergency.

MASTER KEYED

With Master Key, Grand Master Key and Emergency Key. Can be furnished in sets of any required number, with Master Key for each set, and with a Grand Master Key and an Emergency Key to pass all. Can also be Master Keyed in sets with all other Cylinder Locks. Furnished with Display Key to order.

Nos. 6850 and 6850x2

INDICATORS

Hotel Lock Indicators Nos. 8, 9, 11, 12, 13, 14 and 110, are suitable for use with these locks. These indicators have a button that cannot be pushed in when door is locked from inside, thus indicating that room is occupied.

No. 6850X2—Same as No. 6850, except has two cylinders and dead bolt is thrown by key through inside cylinder instead of turn knob.

GENERAL CONSTRUCTION

Case: Japanned.

‡Prices include all key functions described.

With Locks Nos. 6859, 6859x1 and 6815, in Order to Automatically Lock Door When Closed, the Outside Knob Must Be Set by Pushing in the Lower Stop in Face of Lock

No. 6859 Has Stops in Face of Lock and a Dead Bolt; Two Cylinders; No Turn Knob—Same privacy guaranteed as with No. 6850, but lock differs in that latch bolt is operated from both sides by knobs except when outside knob is set by lower stop in face of lock. Outside knob can only be released by pushing in upper stop. Door is automatically locked when closed if outside knob is set by lower stop.

Dead bolt and outside knob are dead-locked against all keys except Emergency Key when locked through inside cylinder and key inside cannot be taken out when thus locked.

The lock is operative at all times from the inside, whether locked from the outside or not, and door can be quickly opened in case of fire or emergency.

Master Keying and Indicators—Same as No. 6850.

No. 6859X1—Same as No. 6859, but dead bolt is operated by turn knob instead of key from the inside.

Has one cylinder.
Master Keying and Indicators—Same as No. 6850.

Nos. 6859 and 6859x1

SARGENT**Cylinder Locks for Hotel Corridor Doors**

For Key Arrangement, see Page 53

All packed with screws to match

No. 6857 Three-bolt Lock Has Protection of Two Dead Bolts—This lock guarantees absolute privacy to guest when dead bolt is thrown on inside by turn knob. Outside knob is operative at all times except when dead bolt is thrown by turn knob from inside, then lock can only be operated through outside cylinder by Emergency Key, all other keys being inoperative. Stationary knob indicates occupied room.

Upper dead bolt is operated only from outside by key. Turn knob operates both upper and center dead bolts and prevents operation from outside except by Emergency Key.

Master Keyed—See below.

Indicators—Hotel Lock Indicators No. 10 are suitable for these locks. Indicator is mortised into door jamb, has push button projected out by center dead bolt operated by turn knob from inside, thus indicating that door is locked. Can also be used with Indicators Nos. 8, 11, 12, 13 and 14.

No. 6855 Has Dead Bolt Operated by Turn Knob; Latch Bolt Operated from Both Sides by Knobs—Absolute privacy assured when dead bolt is thrown from inside by turn knob, which also sets outside knob. When thrown from inside, dead bolt can

be operated from outside only by Emergency Key. Outside knob regularly operates latch bolt at all times except when dead bolt is thrown from inside. When knob is stationary, it indicates that room is occupied.

Lock is operative from inside at all times, whether locked from the outside or not, and door can be quickly opened in case of fire or emergency. Can be furnished with Indicators 8, 9, 11, 12, 13, 14.

Master Keyed—See below.

Bitted Key Mortise Locks for Hotel Corridor Doors

Illustrations
One-quarter Size

Packed with screws to match

For Key Arrangement, see Page 53

When Dead Locked from Inside Can Be Opened Only by Emergency Key, Except No. 6199

No. 6260 Heavy Bitted Key Corridor Door Locks—3 Bolts and 5 Tumblers—When dead locked from inside, cannot be operated except by Emergency Key.

A heavy lock offering greatest protection to guest. Latch bolt operated from both sides at all times except that when dead bolt is thrown on inside, the outside knob is set, indicating to maid that room is occupied. When lower dead bolt is thrown by key from inside, key cannot be removed, assuring key being in lock in an emergency, and all keys are inoperative from outside except Emergency Key. Guest key is operative in lock from inside at all times, whether locked from outside or not.

When locked with Emergency Key, all other keys are inoperative from outside. When locked with Display Key, all locks except Emergency Key are inoperative from outside. Can be furnished to order with Display Key.

Master Keyed—Class B (see below). The price of the Lock includes all Key Functions.

Indicators and Escutcheons Suitable—Hotel Lock Indicators Nos. 8, 9, 11, 12, 13 and 14 are suitable for use with these locks. These indicators have a button that cannot be pushed in when the door is locked from the inside, thus indicating that the room is occupied.

Escutcheons having 6 in. between the screw holes can be cut to fit these locks. In ordering, specify the number of the escutcheon wanted and order it "cut to fit."

No. 6263—Same as No. 6260 except has turn knob instead of key for dead bolt on inside. Price of Lock includes all Key Functions.

No. 6120, a High Grade Lock But Lighter than No. 6260 and with Fewer Key Changes (800)—This lock has exactly the same functions as No. 6260, but has 4 tumblers.

Master Keyed—Class A (see below). The price of the Lock includes all Key Functions.

Indicators and Escutcheons Suitable—Same indicators may be used as for Nos. 6260 and 6263. Escutcheons same as 6260 and 6263 except 5 $\frac{3}{4}$ in. between screw holes.

Escutcheons having 5 $\frac{3}{4}$ in. between the screw holes can be cut to fit these locks. In ordering, specify the number of the escutcheon wanted and order it "cut to fit."

No. 6123—Same as No. 6120, except has turn knob to operate inside dead bolt instead of key.

No. 6199, a Lighter Lock than No. 6120—3 Tumblers with 280 Key Changes—Latch bolt is operated from both sides by knobs at all times. The upper dead bolt is operated from both sides by the key.

The lower dead bolt is thrown from the inside only by the turn knob and cannot be operated from the outside.

Master Keyed—Class B (see below) except Emergency Key. Master Keys No. 933. The price of the Lock includes all Key Functions.

Indicators and Escutcheons Suitable—Hotel Lock Indicators No. 10 are suitable for use with these locks. This indicator, which is mortised into the door jamb, has a push button that is thrown out by the lower dead bolt operated by turn knob from the inside, thus indicating that the room is occupied.

Escutcheons with turn knobs are suitable for use with these locks.

No. 6199 $\frac{1}{4}$ —Same as No. 6199, except that Emergency Key will operate lower dead bolt from the outside when thrown by turn knob from inside.

Master Keyed—Same as No. 6199 except can be supplied with Emergency Key in addition to Master and Grand Master to pass the whole 2,400 locks. The price of the Lock includes all Key Functions.

Nos. 6260 and 6263

MASTER KEYING

Class A—With Master, Grand Master and Emergency Key, also Display Key to order. Furnished in one set of 800 locks or less, all different, with Master Key to pass. Also furnished in sets as desired (every lock different) with Master Key for each set and Grand Master and Emergency Key to pass all 800 locks when desired. Also Master Keyed in sets with all other 3 or 4 tumbler locks in Class A. (Master Key No. 919.)

Class B—With Master, Grand Master and Emergency; also with Display Key to order. Furnished in one set of 2,400 locks (or less), all different with Master Key to pass. Also furnished in sets as desired (every lock different) with Master Key for each set, and with Grand Master and Emergency Key to pass all 2,400 locks when desired. Also Master Keyed in sets with all other Class B Locks. (Master Keys No. 933.)

GENERAL CONSTRUCTION

Case: Japanned.

Bitted Key Mortise Locks for Hotel Corridor Doors

*Illustrations
One-quarter Size*
For Key Arrangement, see Page 53
All packed with screws to match

**Only No. 6119 Allows Operation of Lock by Emergency Key When Locked from Inside.
Price of Lock Includes Key Functions Described**

No. 6119 Has One Dead Bolt Which Is Inoperative to All Keys Except Emergency Key When Thrown by Turn Knob from Inside—Latch bolt is operative by knobs from both sides at all times. Dead bolt when thrown by turn knob from inside can only be operated by the Emergency Key from outside. The lock is operative from inside at all times, whether locked from outside or not, and can be quickly opened in case of fire or emergency. Lock has 4 tumblers and 260 changes.

Master Keyed (Class A)—See below.

Escutcheons Suitable—Escutcheons having 6 in. between the screw holes can be cut to fit these locks. In ordering, specify the number of the escutcheon wanted and order it "cut to fit."

No. 6119, 6113, Special Note: Do not cut the key hole nor the hole for the lower hub clear through the door, but into one side only; the key hole always for the outside of the door and the lower hub for the inside. (The latch bolt is reversible.)

No. 6113 Has One Dead Bolt Similar to No. 6119, But Does Not Offer the Same Protection—The dead bolt is operated at all times by the key from the outside and by the thumb bolt from inside. The latch bolt is operated at all times by knobs from both sides. Lock has 3 tumblers and 260 changes.

Master Keyed (Class A) Except Emergency Key—See below.

Escutcheons Suitable—Same as for No. 6119.

No. 6215—Same as No. 6113, except has 4 tumblers and 280 changes.

(Price of lock includes all key functions described.)

Master Keyed (Class B)—See below.

Escutcheons Suitable—Same as for No. 6119.

No. 6193 Three-bolt Lock Does Not Allow Operation of Lower Dead Bolt by Any Key When Locked from Inside—The latch bolt is operated by knobs from both sides at all times. Upper dead bolt is operated from both sides by key. Lower bolt is operated only by turn knob from inside and cannot be operated by key from outside. Has 3 tumblers and 260 changes.

Special Shutter Attachment—Can also be furnished, on special order, with a sliding shutter which covers the outside key hole so that no key can enter the lock. Turn knob is turned from inside. Specify if Special Shutter Attachment is desired.

Master Keyed (Class A) Except Emergency Key—See below.

For these locks Master Keyed, add 40¢ each.

Escutcheons Suitable—Escutcheons with turn knobs should be used with this lock. We can also furnish, cut special, any of our escutcheons which are long enough to allow the space between the two hubs.

Indicators—Hotel Lock Indicators No. 10 are suitable for use with these locks. This indicator, which is mortised into the door jamb, has a push button that is thrown out by the lower dead bolt operated by turn knob from the inside, thus indicating that the room is occupied.

Bitted Key Mortise Locks for Hotel Communicating and Bathroom Doors

Assuring Complete Control of Communicating and Bathroom Doors by Management

For Keying Arrangement, see Page 53

All packed with screws to match

No. 6143, a Four-bolt, Three-tumbler Lock with Double Dead Bolt Operated by Turn Knob and Upper Dead Bolt Operated by Grand Master Key—Latch bolt operated by knobs at all times. Has two dead bolts, and when either dead bolt is thrown by turn knob from one side, it cannot be retracted from the other side. The short spindles of the turn knobs do not go through the lock.

The Grand Master Key deadlocks the upper dead bolt, preventing communicating between the connecting rooms or between bath room and guest room, should the latter be rented without the bath room.

Master Keyed (Class A)—With Grand Master Key and Emergency Key. Can be furnished in 1 set of 800 locks (or less), all different, with Grand Master Key to pass. Can also be furnished in sets as desired (every lock different), with a Grand Master Key and an Emergency Key to pass the whole 800 locks when desired. Master Key No. 919.

Can also be Master Keyed in sets with all other three and four-tumbler locks in Class A. The price of the lock includes all key functions.

Escutcheons Suitable—Escutcheons with turn knobs are suitable for use with

these locks. Any of our turn knobs with $\frac{3}{8}$ -in. spindle may also be used.

No. 6243—Same as No. 6143, except has four tumblers and Master Keyed, Class B.

Master Keyed (Class B)—With Grand Master Key and Emergency Key. Can be furnished in 1 set of 2,400 locks (or less), all different, with Grand Master Key to pass. Can also be furnished in sets as desired (every lock different), with a Grand Master Key and an Emergency Key to pass the whole 2,400 locks when desired. Master Key No. 933.

High Grade Cylinder Locks for Entrance Doors to Apartments

Packed with screws to match

*Illustrations
One-quarter Size*

With Nos. 6880, 6885 and 6830, Dead Bolt Cannot Be Operated by Janitor's (Master) Key

No. 6880 Heavy Lock Offering Greatest Security Has One Inch Patented Dead Bolt—The latch bolt is operated from the outside by the Tenant's and Janitor's Key and from the inside by the knob. Outside knob is always stationary.

The dead bolt is operative from the outside by the Tenant's Key and from the inside by turn knob. When dead bolt is thrown from inside by turn knob, Janitor's Key is inoperative and prevents Janitor's entrance to apartment. The dead bolt is also patented. It has 1-in. throw and bolt is made with an oblique channel inside filled with steel balls and provides the maximum resistance against forced entrance of jimmy, hack saw or drill. See illustration.

Master Keyed—Can be furnished to order in sets of any required number, with nickel bronze Master Key to pass each set; and a Grand Master Key to pass all.

No. 6880

No. 6830

No. 6885—Similar to No. 6880, except it has stops in the face of lock so that the latch bolt is operated from both sides by knobs or set stationary by pushing in lower stop. In ordering 6885 the thickness of door should be specified and Inside Escutcheon 7855 ordered "cut to fit."

No. 6830—Has the same functions as No. 6880, except that it has a standard solid bronze dead bolt instead of the patented bolt used in No. 6880. It does not have stops in face of front. The front of this Lock is Adjustable Protected Front and can be beveled at any angle from flat to $\frac{1}{8}$ in. in 2 in.

GENERAL CONSTRUCTION

Case: Japanned.
Front: Bronze.
Bolts and Strike: Heavy bronze.

Cylinders: Bronze.
Turn Knob: Bronze.
Keys: Nickel bronze.

Hubs: Brass; Knob hub for $\frac{3}{8}$ -in. swivel spindle; turn knob hub for $\frac{1}{2}$ -in. spindle.

Latch Construction: Easy spring; Easy on latch bolt, firm on knob; two compression springs.

Reversible: No. 6830—Yes, by removing cap.
Nos. 6880, 6885—No; specify hand.
Master Keying: Yes.

HIGH GRADE LOCKS FOR ENTRANCE DOORS TO APARTMENTS

Lock No.	Front		Case size, in.	Backset reg., in.	Strike, lip to center, in.	Spacing, in.		Cylinders	Keys	Master keying	Turn knob	Latch bolt	Each*

*Prices include all key functions described.

No. 6805 $\frac{1}{2}$ Has Upper Latch Bolt and Stop Guard and Dead Locking Stop in Front of Lock—The latch bolt is operated from both sides by knobs except when outside knob is set inoperative by lower stop in face of lock. The upper latch bolt, working on the closed strike-plate, automatically locks the latch bolt and stops in face of lock and prevents forcing of them when door is closed.

Dead-Locking Stop—This lock has a dead-locking stop which is a desirable feature, especially on reverse bevel doors, making it impossible for anyone to push back the stop from the hall side and open the door with the knob.

Adjustable Protected Front as No. 6830 see above.

Master Keyed—Can be furnished to order in sets of any required number, with nickel bronze Master Key to pass each set; and a Grand Master

No. 6805 $\frac{1}{2}$ No. 6705 $\frac{1}{2}$

Key to pass all. For Master Key Locks add \$0.65 each cylinder. For Master and Grand Master Keyed Locks add \$1.00.

Mortise Knob Locks for Bathroom Doors in Fine Residences

All packed with screws to match

Illustrations
One-quarter Size

No. 4665 Heavy Two Bolt Lock—No Key—Locks From One Side Only—Latch bolt is operative by knobs at all times. When the dead bolt is thrown by turn knob from bath room side, it cannot be unlocked from the other side.

Escutcheons—Escutcheons having 6 in. between the screw holes can be cut to fit these locks. In ordering, specify the number of escutcheons wanted and order it "cut to fit." Any of our turn knobs with $\frac{1}{8}$ -in. spindle may also be used.

No. 4669 $\frac{3}{4}$ Heavy Two Bolt Lock, with Emergency Key—Same operation as No. 4665, but has Emergency Key which will retract the dead bolt from the outside in case of necessity.

No. 4663 $\frac{1}{2}$ —Same as No. 4669 $\frac{3}{4}$, only lighter lock.

Escutcheons—Inside: With turn knob. Outside: For $3\frac{1}{2}$ -in. mortise lock can be used without special cutting.

No. 4663 $\frac{1}{2}$ —Same as No. 4665, only lighter lock.

Escutcheons—Escutcheons with turn knobs are suitable for use with this lock.

No. 4668 Heavy Horizontal Lock—Intended especially for Colonial work. Same operation as No. 4665, but lock is long in horizontal direction.

GENERAL CONSTRUCTION

Case: Japanned. Front: Cast bronze.

Bolts and Strike: Bronze.

Keys: Nos. 4663 $\frac{3}{4}$ and 4669 $\frac{3}{4}$ —Nickel; Emergency Key—No. 211 $\frac{3}{4}$.

Latch Bolt: Easy spring: Easy on latch bolt, firm on knob. (Nos. 4663 $\frac{3}{4}$, 4663 $\frac{1}{2}$, 4665 and 4668 also have two compression springs.)

Hubs: Brass: Knob hub for $\frac{1}{8}$ -in. straight spindle; turn knob hub for $\frac{1}{8}$ -in. spindle.

Reversible: Yes, by removing cap.

Mortise Knob Locks for Communicating Doors in Fine Residences

No. 4675 Lock with Three Bolts, No Key—Latch bolt is operated from either side. When locked by turn knob on either side, it cannot be unlocked from the other side. Dead bolts work with short spindle turn knobs. The spindle does not go through the lock.

Escutcheons—Escutcheons having 6 in. between the screw holes can be cut to fit these locks. In ordering, specify the number of the escutcheon wanted and order it "cut to fit." Any of our turn knobs may also be used.

No. 4675

No. 4678

No. 4679—Same as No. 4675, but lighter dead bolts. **Escutcheons**—Escutcheons with turn knobs should be used with this lock. Escutcheons Nos. 841 and 842, in the various designs, when not wider than $2\frac{1}{4}$ in., may be used with this lock.

No. 4678 Horizontal Lock, Three Bolts, No Key—Same operation as No. 4679, but lock is long in horizontal direction.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Bolts and Strike: Heavy bronze (three bolts).

Latch Bolt: Easy spring: Easy on latch bolt, firm on knob.

Two compression springs.

Hub: Brass: Knob hub for $\frac{1}{8}$ -in. straight spindle; turn-knob hub for $\frac{1}{8}$ -in. spindle.

Reversible: Yes, by removing cap.

Rim Lock Sets

Packed with screws to match

A modern trend of many architects is to design dwellings and interiors in the Early English, Norman, Colonial and other styles where mortise locks were unknown. In order to have the hardware carry out the spirit of the design of the architect, rim locks have been designed for this purpose, one of which is illustrated.

Rim Lock with Knob and Key
For Inside of DoorRing Handle and
Escutcheon
For Outside of Door

Set No. 3121

A set complete comprises: 1 Lock No. 3549, 1 Knob and Ring Handle No. 1065, and 1 Escutcheon No. 560.

For doors $\frac{7}{8}$ to $2\frac{1}{8}$ in. thick.

GENERAL CONSTRUCTION

Hub: For $\frac{1}{8}$ -in. straight spindle.

Reversible: No; specify hand.

Backset: Face to center of hub, $3\frac{3}{4}$ in. Key hole, $2\frac{1}{8}$ in.

For brass rim locks suitable for Colonial work, see Nos. J3729 and J3525 on page 62

Extra Heavy Sliding Door Locks for Communicating Doors

No. 6993 for Single Doors—

Has double lock each bolt thrown by T handle from opposite sides of doors. When door is locked by T handle on either side, it cannot be unlocked from the other. Also has pull projected by push button in face of lock.

Escutcheons—Flush Cup Handles No. 290 are intended especially for use with these locks. Any of our Cup Escutcheons can be made to fit, and when so ordered will

take the T Handle of No. 290.

No. 6994—Same as No. 6993, except for Double Doors.

Escutcheons—Same as No. 6993.

GENERAL CONSTRUCTION

Case: Japanned.

Front: Cast bronze.

Bolts, Strikes and Pulls: Bronze.

Tumblers: Nos. 6973 and 6974—Wrought steel.

Hub: Nos. 6993 and 6994—Brass, for $\frac{1}{8}$ -in. straight spindle.

Keys: Nos. 6973 and 6974—Nickel bronze.

Reversible: Yes.

Master Keyed: Yes.

Cylinder Locks for Garage Doors

Packed with screws to match

Illustrations
One-quarter Size

For Sliding Doors

No. 6912 Has Protected Strike and Self-latching Bolt—The bolt will operate even if doors sag. Latch bolt is operative from outside by key and from inside by lever. Can also be held back by stop, as well as by key, allowing use of both hands when opening the door. For doors 1 3/4 to 3 in. thick.

No. 6912

Master Keyed—As No. 4299—opposite.

GENERAL CONSTRUCTION

Case: No. 6912, dead black japanned; No. 4299, japanned.

Bolt: Malleable iron (No. 6912 only).

Keys: Nickel bronze.

Cylinder: Bronze.

Latch Bolt: Self-latching.

Reversible: Yes.

Slide Stop: Bronze (No. 4299 only).

For Hinged Doors

No. 4299 for Single or Double Doors Opening Out—The bolt will operate even if doors sag. Latch bolt operated from outside by key and from inside by pushing back the latch bolt slide stop, releasing it from the strike. Latch bolt can be held back by the slide stop. For doors 3/8 to 2 1/2 in. thick.

Master Keyed—Can be furnished to order in sets of any required number of Change Keys, with nickel bronze Master Key to pass each set and a Grand Master Key to pass all. For Master Keyed Locks, add \$0.65 each cylinder. For Master and Grand Master Keyed Locks, add \$1.00.

Special Lock Strikes

Safety Strike

Protected Strike

Safety Strikes—Packed with locks Nos. 6705 and 6805, in addition to regular strike. Furnished to order with other locks. Price, 40¢ each.

Protected Strikes—Furnished with cylinder locks and latches at additional charge. Furnished to order with other locks.

To Order—Give exact thickness of door and length of strike from center of opening to end of lip.

Box Strikes—Furnished with cylinder locks and latches at additional charge. Furnished to order with other locks.

Protected Box Strikes—Furnished with cylinder locks and latches at additional charge. Furnished to order with other locks.

To Order—Give exact thickness of door and length of strike from center of opening to end of lip.

Strikes with Extra Long Lips—Special strikes, to protect moulding, regularly packed with cast bronze strikes. Also furnished to order for all Mortise Locks.

To Order—Specify distance from center of opening to end of lip.

Box Strike

Protected Box Strike

Hotel Lock Indicators

Packed with screws to match

No. 110—Furnished to order with Cylinder Hotel Locks Nos. 6850, 6851, 6851 1/2, 6852, 6852 1/2 and 6859. Indicators have button that cannot be pushed in when door is locked from inside, thus indicating room is occupied. No knob rose larger than 2 in. can be used with this indicator.

Nos. 8 and 9—Furnished to order with Hotel Locks Nos. 6120, 6123, 6260, 6263, 6290, 6293, 6850, 6851, 6851 1/2, 6852, 6852 1/2 and 6859. No. 8 comes mounted; No. 9 comes unmounted, but may be used with any cast or wrought escutcheon. Add price given to price of the escutcheon.

No. 10—Mortised into the jamb of the door, is visible from the corridor side. Can

be used with Three-bolt Hotel Locks having dead bolt operated from inside by Guest Key or turn knob. Has polished brass button in the center of plate, connected with lever which extends to opening in strike for the dead bolt. Dead bolt, when thrown, strikes against lever, forcing the button out, indicating room is occupied. When bolt is withdrawn, button sets flush with the plate.

To Order—Give thickness of door and number of lock. No. 10 furnished regularly for doors 1 3/4, 2 and 2 1/4 in. thick. Other sizes furnished to order without additional charge.

Nos. 11, 12, 13 and 14—Nos. 11 and 12 show knob No. 1614; Nos. 13 and 14, knob No. 2233, but any of our door knobs may be used.

Exit Bolts With Top and Bottom Bolts

No. 5535, For Exit and Entrance Use.
With Outside Trim

No. 5525, Used for Exit
Only. Cannot Be Oper-
ated from Outside

Inside of Single and Double Doors
Trimmed with Fire Exit Bolt No. 5525

Top and bottom bolts are oper-
ative at all times from inside by
slight pressure or upward pull at
any point on cross bar. When bolts
are withdrawn by cross bar, they
are automatically held in retracted
position until door is closed when
the bolts are automatically projected
into strikes. Withdrawing of the
bolts allows operation over carpets
and rugs, marble or tile, etc., with-
out interference.

Inside and Outside
of Single Door Trimmed
with Fire Exit Bolt No.
5535

Inside and Outside of Double Doors
Trimmed with Fire Exit Bolts Nos. 5525
and 5535.

No. 5535 same as 5525 except that bolts are also oper-
ative from outside by knob except when deadlocked by
key from outside.

Furnished with interlocking machine screws for attach-
ing.

GENERAL CONSTRUCTION

For Stiles: Not less than 3 in. wide.

Handed: Not reversible; specify hand.

Height: Floor to cross bar, 3 ft.

Reversible: Not reversible; specify hand.

Screws: Packed with screws to match.

Keys: No. 5535—Three, No. 267. Can be master

Keyed as other cylinder locks.

Gravity Locking Exit Bolt With Top and Bottom Bolts

No. J5244, For Doors Used as
Exit Only, Opening Out

Both top and bottom bolts are operated
from inside of door only by slight pressure
on the cross bar at any point. Inclosed in the
top case is a device which holds the ends of
the rod in position when they are withdrawn
from the strikes by the operation of the
cross bar, so that the door may be swung
over a carpeted, marble or tile floor.

When the door is closed, the rod is
instantly released by the auxiliary latch and
returns, by gravity, to its locked position.

Cannot be operated from the out-
side of door and
no hardware is
required on the
outside.

Top
Case show-
ing Auxil-
iary Latch

J5244—Cast iron. Steel tubing and rods. Dead
black japanned.

OBW5244—Cast iron. Steel tubing and rods. Gal-
vanized and dull brass finish.

D5248—Brass, unpolished.

B5248—Brass, bright.

P5248—Bronze, bright.

SARGENT**Exit Bolts****Special Features and Information Regarding Exit Bolts****Roll-Back Latch Bolt**

Locks Nos. 997, 993, 1123, 1133, and 1134, used with Fire Exit Bolts on the following pages, are made with an improved action by which they operate instantly when pressure is applied on the cross bar, the

lower latch-bolt being rolled back into the case of the lock instead of being drawn back.

This feature prevents any jamming of the latch-bolt and interference with the operation of the cross bar when sudden pressure is exerted against any part of the door.

Specifications in Ordering

Specify—The height and full width of the door, the thickness of the door, the thickness of the door including the astragal, the width of the stile, the hand of the bolt, whether wanted for single or double doors.

**Hook Attachments**

For use with Fire Exit Bolts Nos. 5754, 5758, 5525, 5535 and 5533 to hold the cross bar in an inactive position and allow its use as a push bar during those hours when free passage through the doorway is desired.

No. 1—Cast bronze. Price, \$1.00 each.

In ordering specify number of Exit Bolt to be used with.

Bar Locking Devices

Furnished at additional charge of \$2.00 each, when ordered with Fire Exit Bolts, Nos. 5754, 5758, 5525, 5535 and 5533.

No. 155

Threshold Stops

For use with Fire Exit Bolts when used on double doors. The Rabbet Former is applied to the threshold so as to act as a stop for the active door. The Buffer Plate is applied to the bottom of the active door so as to strike against the Rabbet Former, protecting the door.

No. 10—Cast bronze. Price, 70¢ each.

Furnished without additional charge when ordered with Fire Exit Bolts.

Rim Fire Exit Bolts**With Roll-back Latch Bolt and Special Hold Back Feature**

No. 5858—Latch bolt operative at all times from inside by slight pressure or upward pull on cross bar at any point, and from outside by key. Latch bolt may be stopped back by key from inside and cross bar locked in an inactive position for use as push bar from inside and door pull is used for opening door from outside.

No. 5858½—Same as No. 5858, except operated from inside only. No trim on outside.

GENERAL CONSTRUCTION

Cross Bar: Wrought bronze, 1 in. diameter.

For Stiles: Not less than 4 in.

For Doors: 1¼ to 2¾ in. thick.

Reversible: Not reversible; specify hand.

Keys: Nickel bronze.

Screws: To match.

† Octagon knob.**Adjustable Screwless Spindle Knobs**

Any of Our Escutcheons Fitted to the Following Knobs Without Charge for Fitting

Model C

Model C is an adjustable screwless spindle knob, threaded at one end, with adjusting collar. It will not rattle or work loose on the shank; suitable for doors of any thickness and can be adjusted accurately without the use of washers. Furnished with a spanner wrench for adjusting and tightening. Made with wide, high collar; any of our escutcheons can be made to fit. On Model C Knobs the outside knob is securely fastened to the spindle; the inside knob only is removable.

Cannot be furnished with Glass Knobs.
For Cast Bronze Knobs (including No. 1622F) with Model C Spindles and suitable Roses add to the list, per pair, \$0.60.

Model C

Model F

Model F is an adjustable spindle, threaded at both ends. Easily and quickly adjusted by grub screws operating through the neck against the spindle. Made with wide, high collar; any of our escutcheons can be made to fit.

Adjustable Spindle Model F can be furnished with Cast Bronze Door Knobs and also with Glass and Opal Knobs and Wrought Bronze Door Knobs where so listed. Nos. 1762 and 1763 can also be furnished to order with Adjustable Spindle, Model F. When ordered with Glass and Opal Knobs, the thickness of the door must be given as the adjustment on these knobs is very limited. Model F Spindle is recommended for use with Oval Knobs, Monogram Knobs or other knobs that must be set in a definite position.

Nos. 1762 and 1763 with Model F Spindles and suitable Roses add to the list, per pair, \$0.20.

Model F

For all other knobs with Model F Spindles and suitable Roses add to the list, per pair, \$0.40.

Model G

Model G is an adjustable spindle, threaded at both ends. Easily and quickly adjusted by grub screws operating through the neck against the spindle. Made with Knob Neck to fit standard bushings; any of our roses and escutcheons with standard bushings will fit.

Adjustable Spindle Model G is furnished regularly with door knobs and lever handles where so listed.

Model G

Model H

Model H is an adjustable spindle similar to Model F but with a bushing to protect the grub screw in the shank of the knob. It is suitable for sectional trim and can also be used on elongated escutcheons when not fitted with turn knobs. By turning the escutcheon or rose, the knob may be adjusted in the usual manner and the grub screw driven down through the hole in the bushing; the escutcheon or rose is then turned back to its proper position and screwed into place.

Adjustable Spindle Model H can be furnished with any of our, Cast Bronze Door Knobs that are made in Model F.

For Cast Bronze Knobs, (including No. 1622) with Model H Spindles with Roses Nos. 282 or 283, add, per pair \$0.50.

Model H

Note: These bolts, for doors opening in, can be furnished for marble, slate or steel partitions using strikes Nos. 255 and 257. In ordering these bolts with strikes, specify each number separately, and give in connection with the strike the thickness of the marble, slate or steel, and the thickness of the door.

SARGENT

Closes screen doors and light inside doors noiselessly. It is easy to apply and easy to regulate. It works promptly and effectively and prevents the slamming of doors.

Suitable for all Light Doors—No. 520 is suitable for use on many different kinds of doors, such as screen doors, office partition doors, telephone booth doors, coat closet and lavatory doors, coupon booth doors, communicating doors, cashiers' cage doors, kitchen doors, back-stairs doors, basement doors and all light interior doors in residences.

Between Screen Door and Outside Door—No. 520 can be applied between the screen door and the outside door where the space is $3\frac{1}{2}$ in. or more. The Door Closer is applied to the screen door and the foot is attached to the soffit, as illustrated.

Sargent Door Closer No. 520

No. 520 Applied to Screen Door

No. 520 Applied Between Screen Door and Outside Door

Easy to Apply and to Regulate—These Door Closers are easy to apply and are suitable for either right or left hand doors without changing any of the parts. The connecting arm may be adjusted to suit different door frames. The regulating screw regulates the speed of closing of the door and may be adjusted as desired.

Simple, Strong, Durable—No. 520 Door Closers are simple, durable and strong. All working parts are enclosed, so that dirt cannot clog or hinder their operation.

Packed with Templates—Sargent Door Closers No. 520 are packed with directions and a template showing how to apply and giving the proper position of the Door Closer on the door.

Price—Cast iron, dark bronzed, each \$5.00.

Door Closers Nos. 41, etc. Successfully Prevent Doors from Slamming

Either right or left hand

Sargent Door Closers have been recognized for many years as standards of quality, dependable in effective operation. To meet the latest requirements of the most progressive architects, engineers, building managers, owners, SARGENT & COMPANY illustrate on these pages a new modern Door Closer.

Extensive research and experiment have resulted in the noiseless and complete control of the closing of any swinging door at the desired rate of speed. The new Sargent Door Closer is made in sizes suitable for all doors, from the simple passage dwelling door to the heavy entrance doors of the most modern commercial structures.

The control valve, of dual type, may be set for any one of three control points, 90, 45 or 10 degrees. The speed valve regulates the speed of closing and can be readily adjusted for changing draft conditions. This door closer offers the greatest possibilities of control. In order that the door may not strike against a wall or a piece of furniture, a back-check valve may be provided in order to stop the opening at about 90 degrees.

This door closer is reversible, right or left hand, without changing any of its parts and without affecting any of its other efficient features. Each Sargent Door Closer is packed, one in a strong fiber box without excelsior or other loose packing. To make application and adjustment simple, a template is packed with each closer.

Cut-open View of Closers Nos. 41 to 46

With Hold Open Device Nos. 61 to 66

Construction Details

(1) **Case**—Spring and piston chamber in relative size gives a pleasing, symmetrical appearance. The back plate is cast solid with the case. No screws to work loose. No undue strain on any one part.

(2) **Springs**—Highly tempered manganese carbon steel wire wound in a helical coil. From 130 in. in length for the smallest size to 184 in. for the largest. Greater elasticity with finer graduations of power adjustment are obtained.

(3) **Piston**—Of cast metal of high tensile strength. Of the rack and pinion type, giving a balanced wear and a continuous travel when the door is in motion. The piston is always in constant control. Of large diameter, it is machined with the case to a tolerance of 1/1000 of an inch—smooth and effective operation is guaranteed.

(4) **Arms**—Of cold rolled steel without swivel adjustments. Adjustments can be made without loosening the arm from the Closer or removing the screws from the foot of the arm. Arms are of extra length—to permit Closer to be placed farther from the butts and door, but allowing the door to open the full 180 degrees without strain.

(5) **Hold Open Device**—A door may be held open at 10, 45, 90 or 180 degrees as convenience requires, and without strain on the Closer or butts. The pawl on the arm engages with projections on the cap of the Closer. All unusual requirements are met for hospital, school, booth, office doors.

(6) **Spindle and Packing**—Spindle and pinion are in one piece of hot forged alloy steel. The spindle is strongly seated in a bearing in the bottom of the case and held in alignment at 3 points. The piston chamber has enough overflow space to relieve the spindle packing from excessive strain.

(7) **Liquid**—Piston chambers are filled with a liquid that long experience

has proved most satisfactory.

(8) **Brackets**—When desirable to place the Closer inside where doors open out, the usual soffit, flush and corner, hanging brackets, and also 4 convenient brackets for circular top doors are designed to care for a greater range of varying conditions.

(9) **Finish and Color**—Standard finish is dark, rich bronze to harmonize with various wood finishes. Other finishes can be furnished as desired.

SARGENT

Espagnolette and Cremone Bolts

For Casement Doors and Windows

The espagnolette bolt is used for the same purpose as the cremone, except that, instead of a rod operating up and down through keepers at top and

bottom, the espagnolette bolt is turned by a handle and causes a hook to engage a keeper at top and bottom, drawing the door tight against the frame.

Section of Double French Windows Showing Right-Hand Cremone Bolt

The hand of casement sash and French windows is taken from the room side. If the butts are on the right, it is a right hand sash; if on the left, it is a left hand sash. It is necessary to state whether the sash opens in or out

Espagnolette Bolts

No. 4107
For windows opening in or out

No. 4110
For windows opening in

Operation of No. 4110

The lever locks the bolt, closed or open, when hanging in a vertical position; a quarter turn of the lever releases the locking mechanism. The hooks securely fasten the windows and draw them close to the rabbet at top and bottom.

Espagnolette Bolts

For Casement or French Windows

Complete with Guides and Rod; all packed with Screws to match

CAST BRONZE

FRANCIS KEIL & SON, INC.

Burglar Jimmy-Saw-Proof Locks, Latches and Hardware Specialties

401-425 East 163rd Street
NEW YORK, N. Y.

For "Keilson" Apartment House Mail Boxes, see Manufacturers' Index

The Saw Test

The revolving hardened steel inserts inside the bronze bolts can not be sawed through

Cylinder Rim Dead Pattern Lock

B51000—Bronze metal throughout. Operated by key outside and knob inside. Case $3\frac{3}{8} \times 4 \times 1\frac{1}{4}$ in. Face to center $2\frac{3}{8}$ in.

Description

Keil Burglar Jimmy-Saw-Proof Locks cannot be jimmied, sawed or forced. Bolts shoot out perpendicularly and turn and rest horizontally in locked position. They have been tested and approved by the Underwriters' Laboratories, Inc., and are recommended by burglar insurance companies.

Made in rim and mortise, front and store door, cylinder patterns. Master-keyed for all purposes to order and other make cylinders replugged. All latch bolts reversible. Ask for booklet.

Night Latch Lock, Screwless Case

B51025—Bronze metal throughout. Operated by key outside and knob inside. Latch can be held in by stop, or deadlocked so key will not open from outside. Case $3\frac{3}{8} \times 4\frac{1}{4} \times 1\frac{1}{4}$ in. Face to center of cylinder $2\frac{3}{8}$ in.

Two-cylinder Rim Dead Lock

B51001—Recommended for glass paneled doors. Bronze metal throughout. Operated from both sides by key only. Case $3\frac{3}{8} \times 4 \times 1\frac{1}{4}$ in. Face to center of cylinder $2\frac{3}{8}$ in.

Cylinder Rim Dead Pattern Lock with Guard Chain

B51005—Bronze metal throughout. Chain is locked when door and lock are open. Operated by key outside and knob inside. Case $3\frac{3}{8} \times 4 \times 1\frac{1}{4}$ in. Face to center of cylinder $2\frac{3}{8}$ in.

Locks B51025, B51000, B51005, B51001, B51002 are for doors $1\frac{1}{4}$ to $2\frac{1}{2}$ in. or to order with rosettes for doors 1 to $2\frac{1}{2}$ in. thick

Outside

Inside

Anti-mortise Apartment and Office Entrance Cylinder Door Latch Lock

Set 55100—Cast brass or bronze metal throughout. For either hand door, suitable only for doors that swing in.

One cylinder lock through knob, regular bevel latch bolt; rim nosing; door knobs operate latch from either side; latch can be deadlocked by stop so that knob will not operate from the outside; latch is operated by key from outside at all times.

Lock case and escutcheon combined, $6\frac{1}{2} \times 2\frac{3}{8}$ and 4 in.; outside escutcheon, $6\frac{1}{2} \times 2\frac{3}{8}$ in.; knobs, $2\frac{3}{4}$ in. diam.; special hub and spindle, $\frac{3}{8}$ in.; face to center of cylinder, $2\frac{3}{8}$ in.

Anti-mortise Apartment and Office Entrance Cylinder Door Latch Lock

Left:

Two-cylinder Rim Dead Lock

B51011—For business entrance doors, especially glass paneled doors. Bronze metal throughout. Operated from both sides by key only. Right or left hand. Case $5\frac{1}{2} \times 4 \times 1\frac{1}{4}$ in. Face to center of cylinders $2\frac{3}{8}$ in. For doors, $1\frac{1}{2} \times 2\frac{1}{2}$ in.

B55000 and B55001—Inside

Anti-mortise Apartment Entrance Cylinder Door Locks

Brass or bronze case, latch, bolts and cylinder. Case, 7×4 in.; swivel hub, $\frac{3}{8}$ in.; face to center of cylinder, $2\frac{3}{8}$ in.; center of cylinder to center of hub, $3\frac{3}{8}$ in.

B55000—One cylinder lock with regular bevel latch bolt, rim nosing for doors opening in. Thumb knob operates bolts from inside. Door knobs operate latch from either side in combination with swivel hub and spindle. Latch can be deadlocked by stop (which is on bottom rim of lock case) so that knob will not operate from the outside. Bolts and latch are operated by key from either side at all times. Practically bronze metal throughout.

B55001—Same as B55000, with flat strike and reverse bevel latch. For doors opening out.

251—Comprising escutcheon plate, $8\frac{3}{4} \times 2\frac{3}{8}$ in.; one piece $2\frac{1}{4}$ in. knobs, no rose; $\frac{3}{8}$ in. swivel spindle.

Right:

Jimmy-Saw-Proof Dead Lock

B51075—Lock with one cylinder and turn knob. B51076—Lock with two cylinders. Bronze metal throughout. Case $3\frac{3}{4} \times 3\frac{1}{2} \times \frac{3}{8}$ in. Face $5\frac{1}{4} \times 1\frac{1}{8}$ in. Back set $2\frac{1}{2}$ in. Note non-tampering cylinder screw device

READING HARDWARE CORPORATION

Manufacturers of "Reading" Hardware

READING, PA.

BRANCH OFFICES

NEW YORK, N. Y. PHILADELPHIA, PA. BOSTON, MASS. CHICAGO, ILL. SAN FRANCISCO, CAL. DETROIT, MICH.

Quality of "Reading" Products

"Reading" Hardware has no superior. In material, operation and design each piece is correctly produced not only for its individual appearance and mechanism but also to conform in its relation to the finished building.

"Reading" also offers a wide variety of designs for any type or size of construction. You are invited to ask for the new "Reading" 600-page Catalog showing the full line of builders' hardware of the better grade.

"Reading" Service

The plant of the READING HARDWARE CORPORATION, Reading, Pa., comprises a complete unit of factory buildings for the modern manufacture of builders' dependable hardware. Starting 78 years ago in one small building, "Reading" has grown into one of the largest organizations capable of handling volume and maintaining quality with smooth-running efficiency. In these days of speeding up construction and cutting down costs, "Reading" is prepared to give architects and contractors the co-operation they expect and must have.

Unit Locks and Latches

Vertical

Door stiles should be not less than $4\frac{3}{4}$ in. wide. Unit locks and latches are shipped assembled complete with the knobs and escutcheons fastened to the lock case. Each lock is a complete unit

to slip into the cut-away in the door stile. A slight adjustment can be made to take care of any variation in the door thickness. This adjustment is very slight and full thickness of door must be specified.

Set 500

Case—With escutcheons, cast brass or bronze

Bolts—Cast bronze

Front—Cast brass or bronze, beveled $\frac{1}{8}$ in. in 2 in.

Strike—Cast brass or bronze, box protected type

Hand—Not reversible, specify hand and thickness of door

Backset— $2\frac{3}{4}$ in.

**Cylinder*—Six pins, changes unlimited

**Keys*—Three, nickel bronze, class 622

Escutcheons—Cast brass or bronze, $9\frac{1}{8} \times 2\frac{3}{8}$ in. At flange 3 in. high

Knobs— $2\frac{1}{4} \times 2\frac{1}{4}$ in. cast brass or bronze

*For sets 520, 500, 505, 800. Can be master keyed with locks having key class 622.

Cylinder Front Door Locks—Vertical

Set 520 with Dead Bolt, Latch and Stops—

Operation—Latch bolt by knob from either side; outer knob set by stop in face; when outer knob is set by stop, both bolts can be operated with key from outside; dead bolt by key from outside and thumb knob from inside.

Cylinder Office Door Locks—Vertical

Set 500 with Latch, Auxiliary Latch and Stops—

Operation—Latch bolt by knob from either side, except when outside knob is set up by stop in face, then by key from outside. Auxiliary latch automatically locks main latch bolt when door is closed, and prevents forcing back of latch from outside. Auxiliary latch will also lock stops when door is closed and stops set, but does not prevent the use of key to open door from outside.

Set 505 with Latch, Auxiliary Latch and Stops—

Operation—Same as 500 with turn knob inside. The turn knob locks against the key on the outside. Inside knob can be used for exit when turn knob is locked and automatically throws the turn knob off when knob is turned to open door from inside. This avoids the turning of turn knob when leaving room.

Set 800 with Latch, Auxiliary Latch, without Stops—

Operation for Lavatory Doors—By knobs from either side and key at all times from outside. Inside cylinder is set under master or grand master key and outside knob is made stationary with key through inside cylinder. Key outside can be used for entrance and will not disturb the stationary position of outside knob.

Closet Latches—No Key—Vertical

Set 510 with Latch—

Operation—By knob from either side. This latch has no locking features.

Communicating Lock Set—Vertical

Set 705 with Latch, Turn Knob Both Sides—

Operation—Latch bolt by knob from either side. Turn knob locks knobs from either side. When locked from one side with turn knob cannot be opened from opposite side.

Set 705½ with Latch, Turn Knob One Side—

Operation for Private Lavatory Doors—Same as 705 with turn knob inside. When turn knob is thrown from inside cannot be opened from outside.

Unless otherwise ordered, unit sets are supplied suitable for single doors. If for double doors, so specify, giving door detail. Unit sets can be furnished for rabbeted doors or with dummy trim. One set in a box complete with necessary screws.

Specify set number, hand, finish and design.

Unit Locks and Latches

Horizontal

Door stiles should be not less than 5 in. wide.

Unit locks and latches are shipped assembled complete with the knobs and escutcheons fastened to the lock case. Each lock is a complete unit

to slip into the cut-away in the door stile. A slight adjustment can be made to take care of any variation in the door thickness. This adjustment is very slight and full thickness of door must be specified.

Set 400

Case—With escutcheons, cast brass or bronze

Bolts—Cast bronze

Front—Cast brass or bronze, beveled $\frac{1}{8}$ in. in 2 in.

Strike—Cast brass or bronze, box protected type

Hand—Not reversible, specify hand and thickness of door

Backset— $2\frac{3}{4}$ in.

**Cylinder*—Six pins, changes unlimited

**Keys*—Three, nickel bronze, class 622

Escutcheons—Cast brass or bronze, $3\frac{3}{4} \times 4\frac{1}{4}$ in.

Knobs— $2\frac{1}{4} \times 2\frac{1}{4}$ in., cast brass or bronze

*For sets 420, 400, 405, 700. Can be master keyed with locks having key class 622.

Cylinder Front Door Locks—Horizontal

Set 420 with Dead Bolt, Latch and Stops—

Operation—Latch bolt by knob from either side; outer knob set by stop in face; when outer knob is set by stop both bolts can be operated with key from outside; dead bolt by key from outside and thumb knob from inside.

Cylinder Office Door Locks—Horizontal

Set 400 with Latch, Auxiliary Latch and Stops—

Operation—Latch bolt by knob from either side except when outer knob is set by stop in face, then by key from outside. Auxiliary latch automatically locks main latch bolt when door is closed, and prevents forcing back of latch from outside. Auxiliary latch will also lock stops when door is closed and stops set, but does not prevent the use of key to open door from outside.

Set 405 with Latch, Auxiliary Latch and Stops—

Operation—Same as 400 with turn knob inside. The turn knob locks against the key on the outside. Inside knob can be used for exit when turn knob is locked and automatically throws the turn knob off when knob is turned to open door from inside. This avoids the turning of turn knob when leaving room.

Set 700 with Latch, Auxiliary Latch, without Stops—

Operation for Lavatory Doors—By knobs from either side and key at all times from outside. Inside cylinder is set under master or grand master key and outside knob is made stationary with key through inside cylinder. Key outside can be used for entrance and will not disturb the stationary position of outside knob.

Closet Latches—No Key—Horizontal

Set 410 with Latch—

Operation—By knob from either side. This latch has no locking features.

Communicating Lock Set—Horizontal

Set 605 with Latch, Turn Knob Both Sides—

Operation—Latch bolt by knob from either side. Turn knob locks knobs from either side. When locked from one side with turn knob cannot be opened from opposite side.

Set 605½ with Latch, Turn Knob One Side—

Operation for Private Lavatory Doors—Same as 605 with turn knob inside. When turn knob is thrown from inside cannot be opened from outside.

Unless otherwise ordered, unit sets are supplied suitable for single doors. If for double doors, so specify, giving door detail. Unit sets can be furnished for rabbeted doors or with dummy trim. One set in a box complete with necessary screws.

Specify set number, hand, finish and design.

DOOR CLOSERS

For Either Right or Left-Hand Doors

Guarantee

The Reading Closer is guaranteed against all imperfections in material or faulty workmanship. Every closer is thoroughly tested on operating doors before being packed. Special care should be used to see that the proper size closer is used for the door, taking into consideration whether there is any unusual draft condition. If the door is subject to any draft conditions, we suggest a size larger closer than listed.

SUGGESTED SIZES

No.	Cast Iron Regular Arm—Arm, Malleable Iron	No.	Solid Bronze Regular Arm
1	For screen or light inside doors.	151	For screen or light inside doors.
2	For inside doors not exceeding 7 ft. high x 2 ft. 8 in. wide.	152	For inside doors not exceeding 7 ft. high x 2 ft. 8 in. wide.
3	For heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide and medium outside doors not exceeding 7 ft. high x 2 ft. 9 in. wide.	153	For heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide and medium outside doors not exceeding 7 ft. high x 2 ft. 9 in. wide.
4	For extra heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide or heavy outside doors not exceeding 7 ft. 6 in. high x 3 ft. 6 in. wide.	154	For extra heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide or heavy outside doors not exceeding 7 ft. 6 in. high x 3 ft. 6 in. wide.
5	For extra heavy outside doors not exceeding 8 ft. high x 4 ft. wide.	155	For extra heavy outside doors not exceeding 8 ft. high x 4 ft. wide.
6	For special conditions of extra heavy doors, or doors subject to unusual draft conditions. We suggest sending us door size and conditions with order.	156	For special conditions of extra heavy doors, or doors subject to unusual draft conditions. We suggest sending us door size and conditions with order.

Above specifications apply to doors operating under normal conditions. If doors are subject to unusual draft, we suggest using size larger closer. Closers finished in gold bronze unless otherwise ordered.

Closers can be painted or plated to match special finishes at slight additional charge. Finish for prime coating, specify finish-PR; for aluminum bronze, specify finish-AL. Specify number and hand. Packed one in a carton.

Closer with Friction Hold-open Arm

(Holder Arm Closer)

This Closer Is Reversible—Its Tightening Nut Holds Door Open at Angle Desired

Advantages of the Hold-open Arm—The friction in the hold-open arm is obtained by loosening or tightening the nut and bolt. This friction can be set to hold the door open in any position up to 90°. If the door is to open 180°, the closer should be ordered with extra long arms. The hold-open arm is positive and avoids the use of all floor stops or hooks to hold the door open. The arm is reversible and can be used on either right or left-hand closers.

SUGGESTED SIZES WITH HOLD-OPEN ARM

No.		No.	
51	For screen or light inside doors.	54	For extra heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide or heavy outside doors not exceeding 7 ft. 6 in. high x 3 ft. 6 in. wide.
52	For inside doors not exceeding 7 ft. high x 2 ft. 8 in. wide.	55	For extra heavy outside doors not exceeding 8 ft. high x 4 ft. wide.
53	For heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide and medium outside doors not exceeding 7 ft. high x 2 ft. 9 in. wide.	56	For special extra heavy doors, or doors subject to unusual draft conditions.

Closer with Fusible Link for Fire Doors

Not reversible.

Door can be set in open position, and in case of fire, a temperature of 160° F. melts fusible link and door closes, thus protecting room from fire and water. Specify hand.

No.	
53-FL	For heavy inside doors not over 7 ft. 6 in. high x 3 ft. wide and medium outside doors not over 7 ft. high x 2 ft. 9 in. wide.
54-FL	For extra heavy inside doors not over 7 ft. 6 in. high x 3 ft. wide or heavy outside doors not over 7 ft. 6 in. high x 3 ft. 6 in. wide.

Closer with Delayed Closing Arm for Hospital Doors

Two-point check feature. Not reversible.

Often preferred in hospitals and sanitariums. Door closes to within few inches and then stops. Can be closed remaining distance, if desired, by slight touch. Aids ventilation and quiet operation. Specify hand.

No.	
053	For heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide and medium outside doors not exceeding 7 ft. high x 2 ft. 9 in. wide.
054	For extra heavy inside doors not exceeding 7 ft. 6 in. high x 3 ft. wide or heavy outside doors not exceeding 7 ft. 6 in. high x 3 ft. 6 in. wide.

EXIT DOOR DEVICES

*For Entrance Doors to Schools or Public Buildings***In Sets—Handle and Thumb Piece Outside with Bolts, 11 and 22****Set 1122, Cast Brass for Double Doors**

Butts and door closers not included.

Set 1122 consists of mortise lock 1571, with handle Benton 2444 for outside, and exit bolt 11 for inside of active door. For the inactive door, exit bolt 22. For description of exit bolts 11 and 22, see next page.

**Lock 1571**

Case $5\frac{1}{4} \times 3\frac{3}{4} \times 1$ in.
Backset $2\frac{3}{4}$ in.
Front $1\frac{3}{8} \times 7\frac{1}{4}$ in.
Spacing $4\frac{1}{2}$ in.
With three keys, Class 622

Operation—Key outside through cylinder sets outside thumbpiece. Key through outside cylinder will hold latch bolt back in case. *The inside exit bar can be operated at all times.* Auxiliary latch bolt when door is closed dead locks the main latch, so that it cannot be forced back from the outside when door is locked.

For Flat Front Doors

Cast Brass Handle for Outside of Active Door

 $2\frac{1}{2} \times 2\frac{1}{2}$ in. $2\frac{1}{2} \times 2\frac{1}{2}$ in.

8 in.

 $1\frac{7}{8} \times 1\frac{7}{8}$ in.**2444. Benton****Set 11122, Malleable Iron, Dull Black**

Bolt for active door, 111. Bolt for inactive door, 122.

This set is same as 1122, except that cases of bolts are malleable iron, the cross bars of heavy steel tubing, and the solid rods of steel. Furnished in dull black finish only. Lock front and outside handle of cast brass.

**Outside**

For doors 2 ft. and under—tubing, 1 in.
For doors over 2 ft.—tubing, 1 in., heavy

Information Required

When ordering, give door thickness, width of stiles, hand of doors, height of doors.

Cross Bars

Furnished 36 in. from bottom, unless otherwise ordered.

**Inside**

Cross bars can be locked down in open position if desired

Specify number and finish. See information required.

EXIT DOOR DEVICES

For Exit and Entrance Doors in Schools, Theatres and Public Buildings

Heavy Wrought 1-in. Tubing

Solid Brass $\frac{3}{8}$ -in. Rods

Cast Bronze

All exposed parts are made of cast bronze with heavy wrought 1-in. tubing for cross bars and solid $\frac{3}{8}$ -in. brass rods. The casting working in connection with the cross bar is made of malleable iron and will withstand the hardest of use. Pressure against the cross bar releases the latch and permits the doors to open. *The latch bolts of Device 22 remain in a retracted position when doors are open, and are not released until the door reaches a closed position.*

Operation—Pressure to any part of cross bar releases latches instantly. Latches operate whether cross bar is pushed up or down.

Device 11 for Active Door

For sets with lock and outside trim, see preceding page.

Information Required

Door thickness; width of stiles; hand of door, taken from outside; width of door, taken between stops; height of door, taken between stops.

A complete line of exit devices are shown in our General Catalog No. 21. *Specify number and finish.*

Device 22 for Inactive Door

Bottom Case, $3\frac{3}{8} \times 2\frac{1}{8}$ in.

Cross Bars

Furnished 36 in. from bottom, unless otherwise ordered.

SCHLAGE

TRADE-MARK

The Company and Its Products

The SCHLAGE LOCK COMPANY first introduced Schlage Locks eight years ago primarily for residential use. The popularity of the Schlage method of locking,

and unique manner of installation which gives security and privacy by a mere pressure of the button in the knob, has resulted in millions of locks being installed and giving dependable service under all conditions. This rapid growth in popularity has also created a demand from the commercial building field, and the Company's latest product, the Type C Lock, is recognized as a distinctly modern lock for modern commercial buildings. This addition to the line is treated in detail below.

HEAVY DUTY LOCKS—TYPE C

Rigid, Self-contained, Factory Assembled Locks

A New Modern Lock

For Modern Hotels, Commercial Buildings, Apartments, Public Buildings, Schools, Institutions, and Fine Residences.

New in Design—New in Principle—100% Reversible—Possesses unusual flexibility. Automatically adjustable from 1½ to 2 in. Unnecessary to specify door thickness. Smooth in operation. Unusually quiet and positive in action. Built for strength and long, uninterrupted service. Compact. Factory-assembled in two interlocking units, a knob unit and a latch unit, which firmly interlock in the exclusive Schlage manner when installed in the door. Knob spindle works directly on latch, without levers, dogs, or cams.

Installed in 2½-in. hole in door stile, and 1-in. hole in door face, in less than ten minutes, greatly reducing labor costs. Requires minimum of cutting, preserving strength of door.

Ideal for either wood or hollow metal doors.

Knob Unit—A husky, rust-proofed, steel hub-frame, containing two heavy tubular steel spindles and a laminated steel, bronze-faced retractor slide, which operates against selected phosphor bronze compression coil springs. Spindles revolve in long bronze bushings, insuring smooth and lasting service. Key and locking mechanism is fully contained within the spindles. Knob unit completely shielded within a snugly fitting bronze cover, or housing. Knobs are seamless brass or bronze castings, although wrought brass or bronze reinforced knobs

Assembled Type C Lock Showing Simple and Rugged Construction

quiet action is immediately appreciated. Regular bevel ¼ to 2 in. Rabbeted if desired.

Lock Control Mechanism—Lock is controlled by Schlage pin tumbler cylinder located in the concave center of the outer knob. Stop-work conveniently located in inner knob safeguards against outside manipulation. Locking mechanism is within the spindles. Pin tumbler cylinders may be masterkeyed or grand masterkeyed as desired. An auxiliary bolt safeguards the latchbolt by automatically deadlocking it, providing positive protection when door is closed.

Quality Materials Throughout—Spindles, hub frame, and retractor slide are of heavy cold-rolled, rust-proofed steel, assuring uniformity, interchangeability and imparting maximum strength. The knobs, escutcheons, latchbolt, and latch face are solid brass or bronze.

Type C Lock with Knob and Escutcheon Removed Showing Latch Unit and Knob Unit Interlocked

and wrought escutcheons and roses are also furnished if desired. Knobs and cylinders are fully interchangeable. Knobs lock onto the spindles with the exclusive Schlage knob catch, which eliminates loose, rattling knobs.

Latch Unit—A sturdy 1-in. tubular bronze housing in which the bronze latchbolt slides, serves as a guide for the latchbolt, insuring perfect alignment of bolt, which is actuated by phosphor bronze compression coil spring. The smooth,

formed in dies, assuring uniformity, interchangeability and imparting maximum strength. The knobs, escutcheons, latchbolt, and latch face are solid brass or bronze.

Door Bored for Type C Lock

Boring two holes preserves door strength

Type C Lock Installed

Held firmly in place by two machine screws

Escutcheons—Escutcheons are either cast or wrought, and are interchangeable. Adjustable on hub-frame, which permits the centering of the lock on the door, irrespective of door thickness. An automatic adjustment and anchor plate bears readings from 1½ to 2 in., permitting instant adjustment to the proper door thickness, and preventing tampering or removal of the outside escutcheon after lock is installed.

Installation—Extremely simple. A 2½-in. hole is bored through the door stile for the knob unit, and a 1-in. hole in the edge of the door, for the latch unit. Schlage patented template insures speedy, accurate installation. Exclusive friction grip prevents lock loosening on door. No adjustments required during, or after, installation.

HEAVY DUTY LOCKS—TYPE C (Continued)

For Hotel Corridor Doors

Type CH—Not illustrated. No button inside. *Operation:* Latchbolt by knob from inside only. Outer knob always rigid. By guest, master and grandmaster, from outside. Auxiliary bolt safeguards the latchbolt, providing proof against end pressure.

Type CHS—Not illustrated. Shut-out button inside. *Operation:* Latchbolt by knob from inside only. Outer knob always rigid. By guest, master, grandmaster, and emergency key from outside. Push-button in inner knob shuts out all except emergency key, providing maximum privacy. Push button automatically released by turning inner knob. Auxiliary bolt safeguards latchbolt, providing proof against end pressure.

Type CHSI—Shut-out button inside. Indicator pin outside. *Operation:* Latchbolt by knob from inside only. Outer knob always rigid. By guest, master, grandmaster, and emergency key from outside. Push button in inner knob shuts out all except emergency key and throws out indicator in outer knob providing maximum privacy. Push button is automatically released by turning inner knob. Auxiliary bolt safeguards latchbolt, providing proof against end pressure.

Type CHSIE—Not illustrated. Shut-out button inside, with emergency key control. Indicator pin outside. *Operation:* Same as Type CHSI, except has emergency key actuated shutout control, which makes all keys except emergency key inoperative when desired.

RESIDENCE AND APARTMENT LOCKS—TYPE A

The illustrations and descriptions below present four Type A Locks—a small portion of the line, which includes fourteen distinct varieties of locks for residence and apartment doors. These are described in detail in our general catalogue. Type A Locks comprise the original Schlage line, and have won wide popularity within a relatively short time. Quick installation,

maximum security, smooth operation, exceptional convenience, and great durability combine to make them ideal for residence and apartment work. Backset $2\frac{3}{8}$ in. Self-adjusting to fit doors $1\frac{3}{8}$ to $1\frac{1}{4}$ in. thick. Solid brass and solid bronze trim. Interior working parts cold-rolled, rustproofed steel. All standard finishes. Installation marker packed with each lock.

Type AVU

For Apartment Corridor Doors and Residence Exterior Doors

Type AVU—Not reversible. Specify hand. *Operation:* Latchbolt by knob from either side. By key from outside when outer knob is locked by pressing indicator turn button in inner knob. Automatically unlocked by turning inner knob, or by key in outer knob. If indicator turn button is pressed and turned to right it will remain in locked position until purposely turned to left. Auxiliary bolt safeguards the latchbolt, making it proof against end pressure.

Type AE

Interior and Exterior Locks for Residence and Apartment Doors

Type AK—Reversible. *Operation:* Latchbolt by knob from either side. By key from outside when outer knob is locked by pressing button in inner knob. Automatically unlocked by turning inner knob.

Type AK

Type AB

For Bathroom Doors

Type AE—Reversible. *Operation:* Latchbolt by knob from either side. By emergency key, knife blade, or screw-driver from outside, in case of necessity, when outer knob is locked by pressing button in inner knob. Button is automatically released by turning the inner knob. Automatic feature prevents accidental locking out.

For Bedroom and Other Rooms Where Privacy Is Required

Type AB—Reversible. *Operation:* Latchbolt by knob from either side. Outer knob is locked by pressing button in inner knob. Button is automatically released by turning inner knob. Automatic feature prevents accidental locking out.

ED 55

ED 56

ED 57

ED 58

View of Assembled ED Lock

Type ED Locks combine all the good features of a mortise lock with the convenient Schlage press-the-button method of locking. They are furnished in distinctive grip-handle designs, and are completely equipped with dull brass knobs and escutcheon plates on the inside of the door. Any knob shown above may be furnished if desired at a slight additional charge. The Schlage turn button indicates at a glance whether the door is locked. An exclusive feature prevents forcible removal of the cylinder from the outside of the door. *Operation:* Latchbolt by key from outside. By knob from inside. By thumbpiece from outside when thumbpiece is not locked by indicator turn button in inner knob. Auxiliary bolt safeguards the latchbolt and makes it proof against end pressure.

Specifications—Front
 —Flat. Brass or bronze.
Strikes—Brass or bronze.
Knobs—Brass or bronze.
Escutcheons—Brass or bronze.
Reversible—Not reversible. Specify hand. **Backset**— $2\frac{3}{8}$ in. **Doors**— $1\frac{3}{8}$ to 2 in. Self-adjusting. **Cylinder**—Brass or bronze. Five pin tumblers. **Keys**—Three nickel silver. Changes practically unlimited. **Masterkeying**—May be masterkeyed or grand masterkeyed with all other Schlage pin tumbler locks.

VON DUPRIN TYPE "B"

The highest grade, double acting, extra heavy mortise lock type panic device made, embodying all of the refinements known to panic bolt construction. *Listed by the Underwriters' Laboratories SA-163 under Life Hazard and Casualty Department approvals.*

Symmetrically designed, sturdy in construction, built to endure. All interior parts are made of special hard bronze; bars and external members, of brass or bronze only.

Features

"Featured to unlatch latch bolts from inside by touch against, or pull up on cross bar at any point at all times."

Feature

No.

1. Cross bar double acting (to or from the door) full 1 in., 16-gauge seamless brass or bronze tube.
2. Ball compensating vertical rod construction, enabling rods to compensate with the action of winding or warping doors, prevents binding rods.
3. Improved method of dogging the cross bars down—a direct drive into the lever arms controlled by two-point key. The housing is lined with seamless steel sleeve. (See feature 11, a drive fit.) Dogging feature furnished on both ends of the cross bar, insuring absolute rigidity.
4. New axle so constructed that axle can not lose out or be removed by children.
5. Easy spring Pullman type, long-swing, vertical latches subject to normal check operation (entirely independent of each other).
6. Special phosphorus bronze compression springs in main case augmented by special phosphorus bronze compression springs in hinged end case of cross bar.
7. Working parts machined and milled. Stumps receiving unusual shocks and wear are covered with case-hardened steel sleeves, eliminating friction and wear.
8. Collapsible Strike No. 250J for single entrance door cylinder locks, eliminating sticking of latches in terrific jams. Ordinary pressure will draw the bolts to a given point where strike completely collapses, leaving free exit. (See full description and detail.)
9. No. 247J adjustable strike for mortise cylinder lock, to take up the gaps caused by shrinking double doors, and preventing picking. (See full description and detail.)
10. Buffer and plates No. 248 for active door of double doors, preventing crowding of door past the strike engagement plane, which function would release auxiliary bolt and permit picking of main latch bolt.
11. Cross bar lever showing holes drilled for axle and dogging feature; both housings are lined with case-hardened steel sleeve, eliminating all friction and wear.
12. Extra heavy exterior trim.
13. Long-life cylinder locks made especially for panic bolt service. Not reversible.

VON DUPRIN THRESHOLDS, STRIKE AND BUFFER CAST INTEGRAL

A Suggestion for Architects—Ordinarily you specify brass or bronze thresholds. Added to this is the price of bottom strikes, which generally are omitted by the contractor (because of the tedious work required to apply). *An unsatisfactory installation—and condemnation of panic bolts.*

Specify Von Duprin thresholds and bottom strikes and buffers cast integral. Furnished with 2-in. No. 14 brass screws and expansions complete. Screw holes drilled in center and intermediate locations as indicated, and 3 in. from each end.

Combining Symmetry, Strength and Durability

When ordinary thresholds are furnished by others, the same are not delivered until after panic bolts are applied. Then, in the frenzy to complete the job, thresholds are crammed in any way to get through. If Von Duprin thresholds are furnished with Von Duprin panic bolts, they are delivered in one shipment—resulting in a good installation.

Thresholds shown below properly executed by us cost very little, if any, more, and produce a highly satisfactory installation.

VON DUPRIN TYPE "A" SELF-RELEASING DOOR DEVICES

With heavy rim cylinder lock. For single entrance door, also double entrance door with mullion. For doors opening outward.

Especially built for high-class shop and school entrance door. Featured to eliminate many troubles heretofore had with such door locks. Made with and without outside deadlocking and unlatching feature. Latch bolt extra heavy hinged car door type, extra easy in movement, and impossible to bind. Cross bar can be dogged by special key dogging devices on both ends of cross bar.

Double Cylinder Type—No. 1025A "Bulldog"—At closing time the watchman turns his key in the inside cylinder, locking the door, barring admittance (except by key), yet permitting the door to be opened from the inside by a touch against the cross bar at any point. When door is again closed, the lock automatically locks itself. Outside cylinder has night latch movement. When the lock is unlocked from the outside, it is unnecessary to again lock it from the inside, as it automatically locks itself. Furnished with grip and thumbpiece.

No. NL1025A "Bulldog"—Has night latch action, grip without thumbpiece, latch retracting feature from operation of key through inside cylinder.

Single Cylinder Type—No. 1026A "Bulldog"—The outside cylinder has the feature of deadlocking the thumb latch. Exit is normal from inside by a push on the cross bar. The same is again automatically locked when the door closes. Furnished with grip and thumbpiece on the outside of the door. Case measures 4 in. wide, 7 in. high.

No. NL1026A "Bulldog"—Same as 1026A, omitting thumbpiece—night latch action only.

No. 1028A "Bulldog"—For exit only. No outside unlatching feature.

No. 1225A "Bulldog"—Case measures 4 in. wide, and 6½ in. high. Furnished with 2¼-in. knob and 2½x8-in. escutcheon on outside of door; latch operated from outside in same manner as any ordinary lock and latch device. Featured to unlatch latch bolt from inside by touch against bar at any point, even though deadlocked from outside.

No. NL1225A "Bulldog"—Same as No. 1225A, omitting knob and escutcheon, and has night latch action. When door is closed, it automatically locks—to be unlocked from the outside by a key.

No outside hardware except cylinder.

Double Cylinder Type Rim Door Device

Single Cylinder Type Rim Door Device

VON DUPRIN AUTOMATIC CO-ORDINATING DEVICES

(Patent No. 1699758)

No. 1236 Rim Type

For controlling double doors with overlapping astragal or rabbeted face doors.

Insures the closing of the inactive door before the closing of the active door.

An attempt to close the active door first is frustrated—it is held open by arm A until the inactive door is first closed. Arm A, being in contact with active door, inactive door engaging bracket B at the closing point, raising the arm A and allowing the active door to close *only after* the inactive door has been closed.

Cast brass or cast bronze only.

No. 1242 Flush Type

For use on pairs of doors with overlapping astragal, or on doors having rabbeted faces. Insures the closing of the inactive door before the closing of the active door.

An attempt to close the active door first is frustrated; it is held open by lower half of device until the inactive door is first closed. Lower half being in contact with active door, inactive door engaging upper half at the closing point raises lower half and allows the active door to close *only after* the inactive door has been closed.

Lower half should rest at top of door, as shown in illustration, and can be adjusted to that position through adjusting screw as shown above.

For proper operation lower half of device must drop in place just as inactive door clears astragal. If arm is too long cut off to proper length with hack saw.

EXTENSION GARMENT HANGER COMPANY, INC.

Dallas National Bank Building
DALLAS, TEX.

Product

THE HOOD EXTENSION GARMENT HANGER for clothes closets.

Description

The Hood Extension Garment Hanger is the most practical improvement ever made in clothes closet equipment.

Possessing superior features of strength, appearance, convenience, and affording maximum economy of floor space, it has met with national acceptance by architects. It is equally useful in the largest and smallest homes, hotels, apartments or offices. In hotel and apartment planning, Hood Hangers are particularly worthy of consideration because of the saving of floor space. Closet areas are reduced to about one-third of former size. This saving of floor space alone will more than pay for the cost of installation.

Clothes hang in their natural position. Equal distribution, a Hood feature, prevents wrinkling. A light pull opens it. It closes with equal ease.

Sizes

Hanger is made in three sizes. The Junior model, capacity 12 to 18 garments, extends to 22 in. and collapses to 8 in. Model 12, capacity 12 to 24 garments, extends to

28 in., collapses to 7 in. Model 16, capacity 16 to 32 garments, extends to 36 in., collapses to 8 in.

Construction

Models 12 and 16 are identical in construction. Wall brackets and lazy tongs are made of 1/8-in. cold rolled steel. The Junior model is made of lighter steel. All models are built to carry a load far in excess of necessary requirements; they will not warp or sag.

The swivel attachment, an exclusive Hood feature, permits the hanger to swing freely in an 180° arc.

Finish

Hangers are finished in rust-resisting gunmetal bronze, and satin nickel, to harmonize with the color combination of any room.

Installation

Hood Hangers may be installed on any flat surface, doors or walls. Shelves are not necessary. Installation is simple. For wood surfaces, ordinary wood screws are used. For hollow walls, tile, plaster, etc., toggle bolts are used. For solid walls, rawl plugs are used. Wood screws are furnished with each hanger. Toggle bolts or rawl plugs will be furnished at small additional cost, or may be purchased locally.

Easy access to shelves and drawers in rear of closets

Hardware for Adjustable Shelving

Where Used—Wherever shelving can be used, "Garcy" Pilaster Strips and adjustable brackets provide easy and economical installation, and permit the utilization of space that is ordinarily wasted with stationary shelves.

Easily Adjusted—Always Secure

Features—Shelves are easily and quickly moved up or down. Brackets snap in and out easily, yet cannot be budged under a load. They are tested up to 600 lb. The slots in the pilaster strips are numbered, making it easy to line up shelves.

Free Samples—Samples will be sent on request.

For Narrow Shelves

No. R73—Cross arm joined to No. P73 bracket. Requires but one pilaster strip, instead of the usual two, at each end of shelves

Shelf or Bin Subdividers

For use with trays or small shelves. The perfect means for storing a great variety of small items.

No. 7362—Consists of two lengths of No. K73 standard, 3/8 in. wide, bolted together, with angles for attaching at each end.

Use with Nos. A73, P73 or T73 adjustable brackets

"Garcy" Pullout Clothes Closet Garment Carriers

Service—To permit the construction of orderly and space saving wardrobes in homes, apartments, hotels, clubs, etc., instead of inefficient and space wasting square closets.

Construction Features—The carriers roll in and out at a touch, smoothly and silently. They fasten with screws, either under the shelf or to the door casing and rear wall.

Finish—Standard finish is statuary bronze. Nickel-plated or other finishes can be furnished.

Advantages—"Garcy" pull out equipped clothes closets require only about half the space of the square

clothes closets, yet provide twice the clothes capacity. This saving in space amounts to as much as 5% of an entire building.

Garments are kept in good condition, are easily accessible and quickly found on their individual hangers, instead of becoming shapeless, torn and buried beneath an accumulation of other garments on wall hooks. Clothes are selected in the light and air of the room. No need of groping for garments in a stuffy, dark clothes closet. Eliminates wiring for lights in closets.

No. 3410. Pullout Garment Carrier

Four Types—These carriers are made in four types, the No. 3410 being the lightest in construction for shallow closets and the No. 3430 the heaviest for deep closets. To be specified by number and sizes as follows:

No.	Sizes closed
3410	15, 16, 18, 20, 22, 24 in.
3402	27, 30 in.
3428	22, 24, 27, 30, 33 in.
3430	30, 32, 36, 42, 48 in.

The Old-fashioned Way

Garments hung any which way—become shapeless, torn, wear out quickly, hard to find, need frequent tailoring and pressing

The Modern Way

A place for everything and everything in its place. Garments hung on hangers—pull out into the light and air for selection. Only half the space but at least double the capacity

**Rollers and Track for Side Disappearing Doors**

Doors equipped with this hardware swing smoothly and silently, with an easy continuous motion into the

interior of the cabinet. As the door is opened, the rear end recedes, until, when fully open, the door has disappeared completely into the cabinet, leaving the front entirely clear and unobstructed.

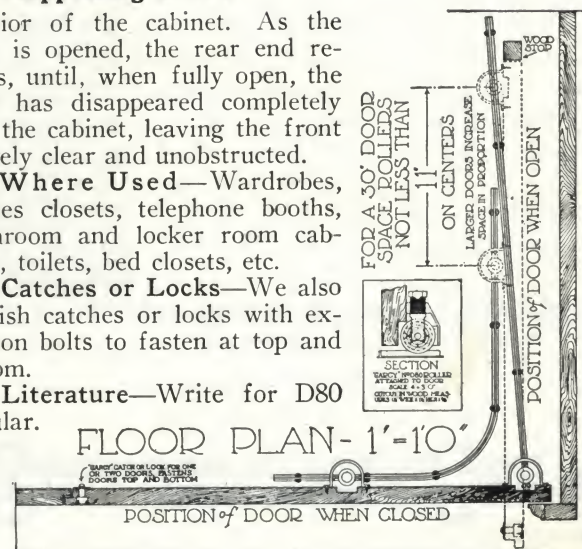

Where Used—Wardrobes, clothes closets, telephone booths, washroom and locker room cabinets, toilets, bed closets, etc.

Catches or Locks—We also furnish catches or locks with extension bolts to fasten at top and bottom.

Literature—Write for D80 circular.

Schoolroom Wardrobe with Side Disappearing Doors

KNAPE & VOGT MFG. CO.

Shelf Supports; Sheaves and Track for Sliding Doors;
Space Saving Clothes Closet Fixtures
GRAND RAPIDS, MICH.

Products

K-V ADJUSTABLE SHELF SUPPORTS.
BALL BEARING SHEAVES and STEEL TRACK for sliding doors.
K-V CLOTHES CLOSET FIXTURES.
K-V GARMENT BRACKETS.
K-V SHOE RACKS.
K-V SLIDING PLUNGER LOCK.

Adjustable Shelf Supports

These patented devices are used for supporting shelving in closets, cabinets, wall cases, etc., without grooving the wood. Slots in the standard (No. 233) permit adjustment of shelving every $\frac{1}{2}$ in. in perfect alignment. The standards are $\frac{13}{16}$ in. wide and are numbered every inch. They are supplied in stock lengths of 24, 30, 36, 48, 60, 72, and up to 144 in., with special screwhead nails for fastening.

No. 233 Standard; No. 237 Support

Made of cold rolled steel, both standards and supports are regularly supplied in nickelplated finish or statuary bronze if desired. Other finishes to order.

No. 237 Support and No. 233 Standard offer the very newest developments in adjustable shelf supports for all shelving requirements. The supports fit perfectly into every slot, and stay "put." An improved feature of No. 237 Support is the construction which allows utilization of all space under the shelf. Each support tested to 700-lb. weight.

Steel Track for Door Sheaves on Light Sliding Doors

No. 458 cold rolled steel track is used in connection with K-V ball bearing sheaves.

No. 458 Steel Track for Sheaves and Sliding Doors

It is supplied in 8, 10 and 12-ft. lengths, in copper plated finish.

Special nails are furnished for fastening.

Ball Bearing Sheaves for Sliding Doors

These patented sheaves are suitable for use in built-in bookcases, china cabinets, linen cabinets, cupboards, and all sliding doors weighing up to, and including 75 lbs.

Ball Bearing Sheave

No. 430 for sliding frame doors. Frame, $2\frac{3}{4} \times \frac{9}{16}$ in. Wheel, $1\frac{3}{8}$ in. in diameter.

The construction is simple, yet it is strong and durable. Smooth running, noiseless in operation, easily installed. Stays in place. Doors so equipped always slide easily and without friction.

Frames and wheels are made of cold rolled steel, and the hardened steel two-point ball bearings run on machined steel axles.

Section Through Bottom Rail of Door Showing How Sheave Is Installed

Plunger Lock

New sliding plunger lock for sliding frame doors. Instantaneous and positive in operation. Bolt goes into place with a slight push. To unlock, the key is inserted and turned, and the bolt snaps back. Inexpensive mortise operation. Perfect lock for all showcases, cabinets, etc., equipped with sliding doors. Finished in statuary bronze.

No. 980 Lock for Sliding Frame Doors

K-V Clothes Closet Fixtures

Purpose—For the proper care of clothing, clothes closet neatness and continual order, in addition to saving space in homes, apartments, clubs, schools, lodges, offices, factories, stores, cloakrooms and hotels.

Advantages—Saves closet space and reduces building costs of new homes; doubles capacity of small closets; keeps clothing in perfect order; makes selection easy; discourages moths and facilitates cleaning.

Construction—Handsome, full-nickeled steel extension bar and rod, operating on rolled bearings in a stationary steel sleeve (also nickeled), which is attached to the underside of the closet shelf or to the back wall and top of door jamb. Slides easily and noiselessly at a touch of the fingers. Cannot get out of order or fail to operate.

Installed in a moment with a screwdriver.

Sizes—Made in sizes to suit any depth of space. Manufactured and carried in stock in multiples of 2 in. from 12 to 60 in. long, closed.

Special lengths made to order. Send specifications for our quotations.

K-V Shoe Racks

Better care of shoes is provided with the K-V Shoe Rack. Instead of a row of shoes on the closet floor or worse, lying around in confusion, the K-V Shoe Rack, easily and quickly attached to the inside of the

closet door or closet wall, provides a means for orderly care, quick selection and convenience.

Made in lengths of 20, 24, 30 and 36 in.

Compare the orderly arrangement shown at right with usual condition of clothes closets.

K-V Shoe Rack on Closet Door

Garment Bracket No. 1136

A convenient garment carrier. Secured to the wall with three screws. Made in 10 and 12-in. lengths. Diameter of rod is $\frac{1}{2}$ in.

Clothing Rod No. 383 (Adjustable)

A rod that will be found useful in all clothes closets of moderate size. Made of metal, nickel finish, 1 in. in diameter. Extends from 30 to 54 in. in length. Screw holes permit attachment to closet wall, or hook rail.

Products

RITE-WAY GARMENT FIXTURES.

For Lawson-Milwaukee Spring Hinges, Toilet Partitions and Shower Doors, see Manufacturers' Index.

Rite-Way Garment Fixtures

The Rite-Way garment fixture is an ideal device for the purpose of accommodating clothes hangers.

It is constructed with a sliding bar, so as to allow all clothes hangers to be simply drawn forward, permitting the removal or rehangng of garments without disturbing the other garments.

Rite-Way fixtures are made of nickelplated steel and are equipped with fiber rollers, making them noiseless and easy to operate. Furnished with screws. Doubles the closet space and keeps garments in good condition.

Where there is no shelf and the closet ceiling is too high, it can be attached to a board fastened between rear wall of closet and inside of door frame.

Special Features—An important feature of the Rite-Way garment fixture is the absolute spacing of the hangers which keeps garments from crowding each other. Any one of them can be removed without disturbing the others. Each hanger has its place and the Rite-Way holds it firm.

THOMAS SWING-IN
HARDWARE for School
Wardrobes; THOMAS
WARDROBES.

Also Hardware for
Garage Doors, Fire Doors,
(Underwriters' Ap-
proved), Folding Doors,
Folding Partitions, Barn
Doors and Overhead Con-
veying Systems.

Thomas Swing-in Hardware

Thomas Swing-in Hardware for School Wardrobes is adaptable to any depth, height, or width of opening and any size door can be handled with the same hardware. Doors operate in pairs or singly, on heavily constructed drop forged steel arms, with full ball-bearing mountings and with a minimum of friction and noise. Pair operation eliminates partitions and mullions.

Thomas Swing-in Hardware permits building wardrobes to meet any condition of ventilation, whether through top, rear, sides, or through grille in doors, if required.

Hardware Separately

Thomas Swing-in Hardware for School Wardrobes is furnished separately to be installed by the con-

tractor. Doors and millwork supplied by the millwork contractor.

Hardware and Woodwork Knocked Down

Thomas Wardrobes may be furnished with hardware and woodwork knocked down, in the white or finished, to be installed by the contractor. Thomas Wardrobes are manufactured for recessed openings with plaster or wood backs, ends and ceilings, or for case type wardrobes which project into the room.

Complete Wardrobe Installation

Thomas Wardrobes are also furnished complete, and installed by the manufacturer. This type installation includes multiple operation, one door operating a series and with multiple locking device. Write the factory for information on installation of this kind.

Catalogues and Prices

Write for A.I.A. file size folder showing full description of Thomas Swing-in Hardware and showing its application.

A.I.A. file catalogue showing Thomas Aurora Line of door hangers, fire door equipment, and garage hardware will be sent on request.

Prices will be quoted by any representative or from the factory.

CHICAGO, ILL.

THE ARMSTRONG CO. OF TENNESSEE

East Heistan Place and Wilson Street
MEMPHIS, TENN.

Products

ARMSTRONG'S "VERY BEST" STEEL SASH PUTTY.

"THARCO" STEEL SASH PUTTY.

ARMSTRONG'S SPECIAL CASEMENT PUTTY.

ARMSTRONG'S SPECIAL LINSEED OIL PUTTY.

ARMSTRONG'S ELASTIC CAULKING COMPOUND.

ARMSTRONG'S MASTIC CAULKING CEMENT.

ARMSTRONG'S SPECIAL MASTIC CEMENT.

Also Armstrong's Glaziers' Putty; Armstrong's White Lead Putty.

Armstrong's Elastic Caulking Compound

Armstrong's Elastic Caulking Compound is a plastic material which sets up with a tough skin on the surface, but remains pliable underneath and never cracks or dries out. It is applied with a caulking tool. It is furnished in colors of natural and gray.

Armstrong's Mastic Caulking Cement

Armstrong's Mastic Caulking Cement is designed for all caulking purposes by gun application. Upon exposure to air a tough elastic skin forms on the outside which serves to retain the oil underneath and keeps the material permanently plastic. It will not run or curl, is not affected by temperatures after application; will not stain stone or brick, attaches itself readily to any building material and works easily through a caulking gun. It is an excellent material for glazing by gun application where conditions want a non-setting material.

Armstrong's Special Mastic Cement

Armstrong's Special Mastic Cement is manufactured for the bedding of residential casement sash. It adheres firmly to brick, stone or wood, will not dry out or soak in, and remains permanently elastic. It can be used with a knife or through a gun. It is recommended for caulking around window frames.

The stock colors are natural, brick red, brown and dark slate.

This material is put up in cans of 1, 2, 5 and 10 lb., and in drums of 25, 50 and 100 lb.

Specifications

For regular steel sash, specify "'Tharco' Standard Steel Sash Putty."

For special glazing work, specify "Armstrong's 'Very Best' Steel Sash Putty."

For casement sash, specify "Armstrong's Special Casement Putty."

For wood sash, specify "Armstrong's Pure Linseed Oil Putty."

Armstrong's "Very Best" Steel Sash Putty

Armstrong's "Very Best" Steel Sash Putty is made from finely ground imported whiting and linseed oil combined with driers to our own formula. It is especially adapted for glazing where the putty will be subjected to severe or unusual conditions, such as in bleacheries, rayon, acid or powder plants, etc.

For monitor and top hung sash glazing, we believe that Armstrong's "Very Best" Steel Sash Putty has no equal. It works easily under the knife, does not wrinkle or sag, and sets up slowly but firmly.

"Tharco" Steel Sash Putty

"Tharco" Standard Steel Sash Putty is adapted for general steel sash glazing. It has just the proper length, does not run or wrinkle and has dependable, lasting qualities.

Armstrong's Special Casement Putty

Armstrong's Special Casement Putty is designed for residential casement type of metal sash. It sets up rapidly, which provides against wrinkling or sagging from the disturbance of the sash. Casement putty should be specified for this type of sash instead of regular steel sash putty.

Armstrong's Special Linseed Oil Putty

Armstrong's Special Linseed Oil Putty is made from imported chalk whiting and pure linseed oil, and should be used for glazing of primed wood sash.

EV-AIR-TIGHT CALKING COMPANY

Owners of the Ev-air-Tight Pneumatic Method of Installation

1516 Summer Street
PHILADELPHIA, PA.

NEW YORK, N. Y.

BRANCH OFFICES
BALTIMORE, MD.

CHARLOTTE, N. C.

Products and Services

WEATHERPROOFING in general, and particularly the combination of several of the following services into a single operation:

Calked joints between window frames and surrounding masonry and between door frames and surrounding masonry.

Calked joints in projecting courses or otherwise exposed masonry, such as copings, steps, terraces, columns, fountains, and monuments.

Calked expansion joints in concrete.

WEATHERSTRIPPING for windows and doors.

MOISTUREPROOFING for exterior walls.

TEMPERATURE INSULATING for exterior walls, interior walls, floors, and ceilings.

SOUNDPROOFING for exterior walls, interior walls, floors, and ceilings.

ACOUSTICAL TREATMENT of interiors.

General Purpose

The various services of the EV-AIR-TIGHT CALKING COMPANY may be said to work toward one common purpose; namely, to effect a more perfect and complete separation between building interiors and the outside world. Any difficulty in excluding moisture, wind, dust, and hot or cold air; any effort to reduce the consumption of fuel; any attempt to prevent damage to decorations and finish from weather or dust or smoke; any need for action to prevent deterioration of masonry—these are problems that call for Ev-air-Tight service. Figures on the infiltration of air around doors and window sash, around their frames, and through actual wall and roof materials, all bear out the necessity for careful treatment of buildings to prevent losses through waste and deterioration.

Material

For calking work, we use exclusively Pecora Calking Compound. This material is a plastic substance that can be forced by our methods into small deep spaces. When exposed to the air, it forms a tough but flexible and elastic skin, under which the compound remains unchanged. It adheres firmly to stone, concrete, terra cotta, metal, glass, brickwork, wood, and all building materials. It is available specially colored to match materials, such as marble, and has no staining effect.

For our weatherstripping work we use only the products of the Monarch Weatherstrip Co., a notably high-grade and efficient strip. This weatherstripping material is offered in forms that meet all problems arising out of the leakage of air between windows and doors and their frames.

For moistureproofing exterior walls we use only Pecora Waterproofing, a deeply penetrating, non-staining, long-lasting material brushed on by hand.

For our temperature insulating work, for soundproofing, and for acoustical treatment of interiors, we use a cellular substance that is previously fireproofed and verminproofed chemically, and that is applied by

the spray method with a powerful binding agent that fastens it permanently and with any desired bulk to any surface. It has fire-resisting qualities and by virtue of its resistance to air pressure it is also useful as a dustproofing barrier.

Equipment

We invented and control a special calking gun from which calking compound is forced under approximately 130 lb. air pressure, generated by portable motor-driven compressor outfits, specially designed by us for this work.

This pneumatic method accomplishes the penetration of sufficient material to fill every bit of space to the exclusion of air and moisture, thus insuring permanent elasticity of the compound.

The forcing pressure is uniform and the delivery outlet of the calking gun is gauged to deliver material into the joint only. Neither frames nor masonry can be smeared or stained, and the exposed finished surface of the joint is clean-cut and smooth. It surpasses previous methods of pointing in every way.

We use for weatherstripping work the equipment devised by the Monarch Weatherstrip Co. out of their long experience in such work.

For moistureproofing we use the brushing method, taking advantage of access and preparation of surfaces involved in our other types of work.

For the application of cellular material used for temperature insulation, soundproofing, and acoustical effects we use spraying under pneumatic pressure.

Labor

Our labor is specially trained to the use of our particular materials and equipment. Our men are competent to handle intelligently the various conditions (ordinary or otherwise) that may present themselves.

Method

Any one of our services is available separately, but we prefer whenever possible to submit estimates based on the handling of a weatherproofing operation as such, to include everything a structure may require for its self-protection as well as the protection of its occupants and contents. The economy of preliminary work and the consequent saving in contract prices to the building owner are obvious.

Specification Data

Specification forms have been compiled from various specifications as developed by certain prominent architects, and will be sent on request.

Further Information

Upon receipt of request, on stationery containing their printed letterhead and address, we will send to those interested lists of installations and other data covering the subject generally.

Information requested on any specific detail, or out-of-the-ordinary problem in connection with weatherproofing in general and calking in particular, will be furnished without obligation.

ESTABLISHED 1889

H. B. FRED KUHL'S

Manufacturer of Kuhls' Elastic Glazing and Caulking Compositions

OFFICE AND FACTORY

6411-6423 Third Avenue, BROOKLYN, N. Y.

Products

ELASTIC GLAZING COMPOSITION—For glazing skylights, conservatories, bedding and glazing of glass in steel or sheet metal frames and all other glass construction work.

ELASTIC CAULKING COMPOSITION—For caulking between masonry of window and door frames of wood or steel.

For Kuhls' Elastic Waterproofing Composition, See Manufacturers' Index. On the same pages will be found a list of agents carrying stocks, and also architects who have specified Kuhls' Elastic Products.

Kuhls' Elastic Glazing and Caulking Compositions

They yield slightly to atmospheric conditions, yet always make a tight joint, and are not affected by vibration, heat, cold or moisture. Will not crack, peel or chip. Adhere strongly to wood, metal, glass, etc., bedding perfectly, and always making a tight joint.

The stock color of Kuhls' Elastic Glazing and Caulking Compositions is light gray. Any desired dark shade or color can be furnished at the same price as the stock color.

Kuhls' Elastic Glazing and Caulking Compositions

are of such consistency as to be easily applied with a trowel, knife or gun.

Put up in cans of 1, 2 and 5 lb.; in drums of 12½, 25, 50 and 100 lb.; in half-barrels of 100 to 500 lb.; and in barrels of 700 and 800 lb.

In the service of H. B. FRED KUHL'S is a corps of experienced men, each trained in his respective line to co-operate in the fullest measure with architects, engineers and contractors. This efficient service in the use of Kuhls' Elastic Glazing Composition is without obligation.

Architects on the Pacific Coast are referred to the California Minwax Corporation, 1322 So. Los Angeles Street, Los Angeles, Cal., who have a staff of trained waterproofing engineers. They will gladly furnish information and samples gratis.

Glazing Composition—Kuhls' Elastic Glazing Composition for bedding and glazing sash, skylights, conservatories and glass construction in general is an ideal material. It is elastic and retains its elasticity indefinitely because it never sets hard or becomes brittle. This saves breakage of glass—especially important in the case of wire glass.

Its use is economical, as it is double the bulk of white lead putty, and retains its essential qualities indefinitely.

Specifications for Kuhls' Elastic Glazing Composition

For Bedding and Setting Glass in Sash, Doors, Skylights, Conservatories, Marquises, etc.—Kuhls' Elastic Glazing Composition shall be used in the same way as ordinary putty in bedding and putting glass. For wood sash and doors the wood shall first be primed; or, on old work, the wood sash and doors shall be scraped and painted before setting the glass. For metal or metal covered sash and doors, the glass shall be bedded in the glazing composition and then secured in place with metal clamps, sprigs or mouldings, or the composition smoothed off, depending on the construction.

General Specification (Under Glazing)—All glass, unless otherwise specified, required for sash and doors of metal, metal covered or wood, shall be bedded and set or puttied with Kuhls' Elastic Glazing Composition (manufactured by H. B. FRED KUHL'S, Third Avenue and 65th Street, Brooklyn, N. Y.). It shall be secured either by clamps or metal or wood mouldings, sprigs, supplied by other contractors, or puttied as required.

The Elastic Glazing Composition shall be delivered at the job or factory, where glazing is to be done, and is not to be opened until after the inspection and approval of the architect.

Specifications for Kuhls' Elastic Caulking Composition

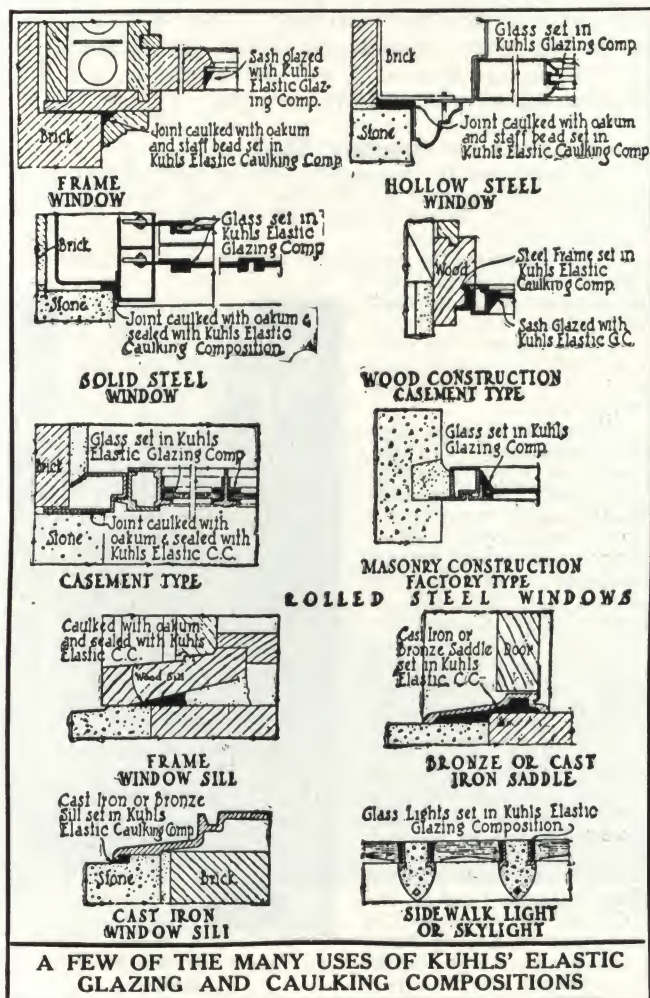

Caulking Exterior Wood Window and Door Frames—

For new or old frames, the staff bead shall be removed and the joint between the frame and the masonry on all sides, jamb, head and sill, shall be completely filled with Kuhls' Elastic Caulking Composition so that it will project out beyond the masonry. The staff bead, when placed in position, shall be pressed into the Elastic Caulking Composition.

If the joints are wide and deep on old work, they shall be caulked with oakum to within ¼ in. of the surface; then the remainder of the joints shall be filled with Kuhls' Elastic Caulking Composition as for new work.

Caulking Steel or Metal Frames—When metal frames are set in masonry after opening has been built, the inside edge of the masonry opening or the frame shall be buttered with Kuhls' Elastic Caulking Composition and the frame pressed into place and secured.

Where frames are already set, Kuhls' Elastic Caulking Composition shall be used to thoroughly caulk between the frame and the masonry, at head, jamb and sill.

A FEW OF THE MANY USES OF KUHL'S ELASTIC GLAZING AND CAULKING COMPOSITIONS

"BREER'S" METAL SASH PUTTY;
"EFKO" WOOD SASH PUTTY; TRIPLE
LEADKOTE PAINT; "BREER'S" METAL
COATINGS; INTERIOR WALL PAINTS;
LIQUID COLORS; BRICK and CEMENT
COATINGS.

Putty Should Be Specified

The failure of putty, due to cracking, wrinkling, sagging, and breaking away can be avoided by specifying putty made to a definite formula by a special process and properly aged. The importance of putty specifications, from an architectural and engineering viewpoint, cannot be overstressed.

Breer's Metal Sash Putty

Proved by ten years of service and recognized by engineers as most durable. Manufactured for special use on steel factory and case-metal sash, marquises, etc. Our own special process of manufacture and aging produces a putty which works very freely under the knife, sets sufficiently on surface for painting within a week, and does not wrinkle, sag or form oil pockets. Perfect condition guaranteed for two years. Will last indefinitely if properly painted.

"EFKO" Wood Sash Putty

Widely known and used by large sash manufacturers and glaziers for bedding and setting glass in sash, doors, skylights, conservatories, etc. Guaranteed pure English chalk whiting and linseed oil, free from adulterants.

United Shoe Machinery Corporation
Building, Boston

"EFKO"
PRODUCTS

Manufactured and aged by our own special process and produces most satisfactory results.

Specifications for Glazing

Metal Sash—

All glass shall be thoroughly bedded and glazed with Breer's Metal Sash Putty, as manufactured by E. & F. KING & Co., INC., Boston, Mass.

Wood Sash—

All glass shall be thoroughly bedded and glazed with "EFKO" Wood Sash Putty, as manufactured by E. & F. KING & Co., INC., Boston, Mass.

Triple Leadkote, a Primer for Standpipes, Gasholders, and Transmission Towers

This paint is designed as a primer for every class of steel construction where absolute protection from corrosion is required. It is composed of all pure lead pigments, which give the maximum adhesion, cohesion, and inhibition when properly incorporated with our specially processed oil vehicle. These pigments are of a compound nature which prevents the formation of corrosion couples when aluminum or elementary pigment paints are used as finishing coats.

Breer's Metal Coatings for Structural Steel and All Metals

Designed and proven to give the best steel protection, they stand the highest test when used over Triple Leadkote. Especially used for painting of bridges, towers, steel sash, structural steel, etc.

Ten years of thoroughly satisfactory service on specified work have established irrefutably the excellent quality and entire dependability of Breer's Metal Coatings. They withstand exposure to every climatic condition, are waterproof, insoluble in common acid and salt solutions, and also impermeable to stray electric currents.

Specifications for Painting Steel

All steel shall be thoroughly cleansed and scraped of all metal scale, rust, grease and any other foreign substance at the shop, and shall be given one full priming coat of Triple Leadkote before erection.

After erection, the complete structure shall have two full coats of Breer's Metal Coating of colors to be selected. All surfaces which cannot be second-coated after erection shall have a field coat of Breer's Metal Coating before erection.

Specifications for Structural Steel—(1) Encased in Concrete—The steel shall be thoroughly cleaned and scraped, removing all loose metal scale or grease and other foreign substances, and shall be painted one shop coat of Breer's Metal Coating No. 202 Dark Gray. Any places where the paint film is ruptured or torn, shall be touched up after erection with No. 202 Dark Gray.

(2) Steel Encased in Brick, Terra Cotta, and Limestone—Structural steel shall be thoroughly cleaned of all metal scale and grease and shall then receive one full coat of Breer's Metal Coating No. 202 Dark Gray, followed by two coats of Breer's Metal Coating, color to be selected by architect after erection.

Public Utilities Building,
Boston

Breer's Wall Finish

Breer's Wall Finish is a paint of unusual durability and offers a wide range of delicate shades which may be easily and frequently cleaned. It can be washed indefinitely, and so non-porous and impervious is its surface that ordinary dyes, such as ink or even blood stains do not penetrate but remain on the surface so that it is very easy to remove them.

This paint is offered in two finishes, a flat and a delicate eggshell, both of which are non-porous, easily washable films.

Breer's Wall Finish produces very clean, sharp, and distinct tints, and by using Breer's Liquid Colors it is possible to obtain any delicate shade that might be desired. Its opacity is so great that even with these delicate tints it is possible to obtain a solid job in two coats, and the covering capacity will compare favorably with any flat in the market.

In application it brushes very freely, much better than the average flat, and does not cause the shiners which result with some flat finishes when the application is necessarily slow and where laps are likely to result from peculiar painting conditions. Being a very heavy-bodied paint, it stays in the brush, so that when painting ceilings there is no tendency for it to run down the handle and cause difficulty in application. This quality also enables the painter to speed up his job, since the paint stays where applied, and makes it possible for him to bring the work to a sharp finish—as, for instance, at the meeting of the chair rail and the wall surface.

Breer's Wall Finish exhibits no tendency towards sagging. Another feature is that this paint does not settle, but remains a very soft, fluffy paste which can be easily stirred to the proper consistency for application.

Owing to the remarkable opacity and covering ability of this finish, the cost of the final job is not great. The experience of our larger customers, on both new and old work, shows an average saving of 25% in labor cost because of the ease with which this paint can be applied.

Note: In washing this paint, simply use a mild soap solution, and wash with a sponge. It is preferable to sprinkle a slight amount of pumice powder on the sponge in order to remove the stain more rapidly.

Specifications for Wall Finish

New Walls—Apply a priming coat of about equal parts of Breer's Wall Size and Breer's Wall Finish. If the surface is very porous, increase the proportion of the size. Allow 48 hours to dry, and apply one or more coats of Breer's Wall Finish at 48-hour intervals.

Old Walls—All dust and dirt of a greasy nature should be removed by washing with gasoline or a solution of $\frac{1}{2}$ lb. oxalic acid in 1 gal. of water. Walls should then be cleaned with soap and water before the paint is applied. If painted walls are in good condition only one coat will be required, unless a light color is to be used over a dark color.

Note: If an eggshell gloss is desired, thin the paint with about 1 pt. of Breer's Varnish Liquid to 1 gal. of paint.

Breer's Liquid Colors

With these new colors it is easy to obtain the more delicate wall paint tints exactly as desired.

Mill White

Vivax—An interior paint especially designed to retain its whiteness over an indefinite period. For use in industrial buildings where maximum light reflection is desired. Furnished in flat, eggshell, or gloss finishes.

Vivax Fume Proof—To be used where acid or alkali fumes are present. Will not discolor under these conditions as the ordinary mill whites do.

Brick and Cement Coatings

Ceralith—A pigmented primer for use on brick, cement, and plaster. Has an alkaliproof vehicle which is not easily affected by free lime or "hot spots" in plaster or cement. Usually used as a priming coat under Vivax.

Outside Cement Coater No. 108—Designed for exterior priming of concrete surfaces.

Finishing Coat No. 109—An outside cement finishing coat which provides the necessary elasticity and toughness to withstand severe exposure and service.

Specifications for Mill White Work

Apply one coat of Ceralith, thinned if necessary with Ceralith Thinner only, according to manufacturer's directions, and one or two finishing coats of Vivax, with flat, eggshell or gloss finish.

Specifications for Concrete, Brick, Terra-Cotta, etc. (Exterior)

These surfaces shall be properly dampproofed and thoroughly dry. Then apply one full coat of No. 108 Outside Cement Coater, followed by two full coats of No. 109 Cement Finishing Coat.

Forty-eight hours shall be allowed for drying between coats.

Literature

Circulars, color cards, and complete specification books ready for filing, sent on request.

LASTIK PRODUCTS CORPORATION

Caulking and Glazing Compounds, Pointing Cements, Roof Plastics
and Waterproofings

FACTORY
WAMPUM, PA.

GENERAL OFFICES
826 Oliver Building, PITTSBURGH, PA.

WAREHOUSES
LINCOLN, N. J. BIRMINGHAM, ALA.

Lastikalk Caulking and Glazing Compound

A waterproof plastic that is weatherproof, being unaffected by changes in temperature or chemical gases. It will surface-dry for painting overnight, yet permanently remains pliable underneath, never cracking or drying out. It will adhere to any surface—wood, metal, masonry or glass. It expands and contracts with the surface to which it is applied under any and all conditions. It can be applied in any weather; heat, cold or moisture will not affect it. Stocked only in gray. Any shade matched from color chip.

For Caulking (Three Consistencies)—Knife Grade—To be applied with a caulking tool.

Gun Grade—To be applied with a hand-caulking gun.

Pneumatic Pressure Grade—To be applied with pneumatic pressure gun at 100 lb. pressure or more.

Fig. 1

**Lastikalk Compound with
Oakum Behind the
Staff Bead**

Fig. 2

**Lastikalk Compound Be-
tween Staff Bead and
Masonry**

For Glazing—For all types of construction that are subjected to unusually severe conditions: i. e., gas and acid fumes, excessive vibration, variations in temperature, etc., Lastikalk Compound should be used for bedding and glazing all glass. Its elasticity prevents breakage of glass. It goes much farther than putty.

Packing—Lastikalk is packed in metal containers from 1 to 600 lb.

General Specifications—All joints around outside windows and door frames shall be caulked with Lastikalk Compound, applied in accordance with the specific specifications.

Specific Specifications—Wood Window and Door Frames—(1) *For caulking behind staff bead (Fig. 1).*

(a) The general contractor shall provide for removing temporarily set staff beads previous to the caulking of joints around window and door frames; and after caulking is completed, inspected and approved, he shall reset same permanently in place.

(b) Where joints between frame and surrounding masonry are wider than $\frac{1}{4}$ in. and deeper than $\frac{3}{4}$ in., these joints shall be packed to within $\frac{1}{2}$ in. of frame surface with dry jute or oakum, solidly tamped. The remaining space shall be filled with Lastikalk Compound.

(2) *For caulking between staff beads and masonry or where there is no staff bead (Fig. 2).*

(a) Thoroughly caulk all joints around all window and door frames with Lastikalk Compound, forcing compound into the space between staff beads and masonry [between frames and masonry], around jambs, heads and sills.

(b) Where joints between the staff bead and surrounding masonry [between frames and surrounding masonry] are wider than $\frac{1}{4}$ in. and deeper than $\frac{3}{4}$ in., these joints shall be packed to within $\frac{1}{2}$ in. of frame surface with dry jute or oakum, solidly tamped. The remaining space shall be filled with Lastikalk Compound.

Lastik Pointing Cement

For pointing up masonry and stonework. This product has been developed to meet the specific needs of this particular kind of work. Its high elasticity of body combined with its cementlike appearance and tenacity of "staying put," make it invaluable in exterior pointing of exposed joints. It is used extensively on tile, limestone and terra cotta construction. *It is absolutely stainless.*

Specifications—(1) New Work—The stone mason contractor will rake back all joints from $\frac{1}{2}$ to $\frac{3}{4}$ in. before the cement hardens, and fill in with Lastik Pointing Cement.

(2) *Old Work—*The contractor will clean out all old cement and loose dirt and fill all crevices with Lastik Pointing Cement. This insures a positive seal against weather, and is permanently waterproof.

Lastik Liquid Roof Paint and Lastik Asbestos Roof Cement

These products are made from long fibre asbestos combined with asphalt and non-drying oils. They are waterproof, heat resisting, unaffected by gases or acids of all descriptions and remain pliable and plastic for years. They will expand and contract with the surface to which applied. *They contain no coal tar whatever.* A permanent guarantee of waterproofing and weatherproofing to the surface to which applied. Made in red, gray, green and black at trowel consistency.

Lastik Wampum Brand Furnace Cement

A soft gray paste which hardens under extreme temperatures—will not run, crack, crumble or peel even under heat pressure of 2500° F. Easily applied with a trowel and ideal for castings, joints or openings of any description on any warm air furnace either gas or oil burning.

Waterproofings

Made to meet the United States Government Specifications under all conditions. Write for more complete data.

PLASTIC PRODUCTS COMPANY

Manufacturers of Putty Exclusively

6475 Georgia Avenue, DETROIT, MICH.

BRANCH FACTORIES

CHICAGO, ILL., 3100 West 51st Street

JERSEY CITY, N. J., 42 Halladay Street

Products

PLASTOID STEEL SASH PUTTY.
PLASTOID METAL CASEMENT PUTTY.
PLASTOID PURE LINSEED OIL PUTTY.
PLASTOID ACID RESISTING PUTTY.
PLASTOID CAULKING COMPOUND.

Plastoid Putties

Plastoid Putties are formulated from blends of high grade whittings, driers and oils that experience has shown will produce the dependable and lasting qualities necessary for satisfactory glazing. The imported, soft, amorphous chalk whiting used absorbs oil readily and permanently. This produces a velvety texture and a smooth, easily painted surface.

Specifications

Plastoid Steel Sash Putty—For regular steel sash with interior glazing.

(1) Putty used shall be Plastoid Steel Sash Putty, manufactured by the PLASTIC PRODUCTS COMPANY.

(2) Putty shall not be applied if sash are damp, iced, frosted or dirty. Dirty or rusted sash shall be cleaned with a wire brush before applying putty.

(3) **Bedding**—Glass shall be bedded with thin putty and putty may be cut with a minimum amount of high test gasoline for this purpose.

(4) **Setting Glass**—When bedding is applied, glass shall be set and secured with full number of clips for which sash is designed.

(5) **Facing**—Facing shall be done if possible without cutting the putty. In cold weather putty shall be stored in warm place until needed. If putty has become settled out, whole container shall be emptied and thoroughly mixed before use. Occasionally in extreme weather it may be necessary to thin putty slightly for facing. Only a small amount of high test gasoline shall be used, as more than a small amount will be harmful. Facing putty shall be smooth and regular and, after facing, any bedding putty which may have oozed out shall be trimmed off.

(6) **Painting**—After putty has set, or in about a month, putty shall be well painted with one coat of good paint.

Plastoid Metal Casement Putty—For casement type sash with exterior glazing.

(1) Putty shall be Plastoid Metal Casement Putty, manufactured by the PLASTIC PRODUCTS COMPANY.

(2) Putty shall not be applied if sash are damp, iced, frosted or dirty. Dirty or rusted sash shall be cleaned with a wire brush before applying putty.

(3) **Bedding**—Glass shall be bedded with thin putty and putty may be cut with a minimum amount of high test gasoline for this purpose.

(4) **Setting Glass**—When bedding is applied, glass shall be set and secured with full number of clips for which sash is designed.

(5) **Facing**—Facing shall be done if possible without cutting the putty. In cold weather putty shall be stored in warm place until needed. If putty has become settled out, whole container shall be emptied and thoroughly mixed before use. Occasionally in

Plastoid
(REGISTERED)

extreme weather it may be necessary to thin putty slightly for facing. Only a small amount of high test gasoline shall be used, as more than a small amount will be harmful. Facing putty shall be smooth and regular and, after facing, any bedding putty which may have oozed out shall be trimmed off.

(6) **Painting**—After putty has set, or in about a week, putty shall be well painted with one coat of good paint.

Plastoid Pure Linseed Oil Putty—For glazing wood sash.

(1) Putty used shall be Plastoid Pure Linseed Oil Putty, manufactured by the PLASTIC PRODUCTS COMPANY.

(2) **Priming**—The thoroughly dried sash shall be dipped in linseed oil and then allowed to drain and dry.

(3) **Bedding**—Putty may be heated or cut with pure linseed oil if thinning is required for thorough bedding.

(4) **Facing**—Facing shall be smooth and regular. No ingredients shall be added to the putty other than pure linseed oil. When finished, sash shall be carefully stored away, and under no circumstances shall be jarred or handled until putty is firmly set.

(5) **Painting**—After sash are erected, putty shall receive at least two good coats of reliable paint.

THE TREMCO MANUFACTURING CO.

Caulking, Pointing and Glazing Compounds, Waterproofings and Paints

393 East 131st Street
CLEVELAND, OHIO

CANADA: THE TREMCO MANUFACTURING CO. (CANADA) LIMITED, TORONTO, ONT.

Tremco Glazing Compound

A cushionlike, non-hardening, tenacious material easily handled by professional glaziers, weatherproof and waterproof, takes up expansion and contraction, absorbs vibration, unaffected by moisture, gases, acids, etc., made in 6 colors, for wood or steel sash.

Glazing Specifications—Write for detailed specifications.

Wood Sash—Bed all glass in Tremco Glazing Compound as manufactured by THE TREMCO MANUFACTURING CO., and delivered on the job in the original sealed containers. Set all glass with glazier's points and bed and face putty with Tremco Glazing Compound.

Metal Sash—All glass in metal sash shall be bedded, held in place with spring glazing clips and face glazed with Tremco Glazing Compound, special consistency for steel sash glazing, as manufactured by THE TREMCO MANUFACTURING CO.

Tremco Caulking and Pointing Compound

A non-staining plastic compound which will never become brittle or crack. Adheres tightly to wood, metal or masonry, forming a weatherproof, waterproof joint. Stock colors are gray, chocolate brown, stone, red and green. Two consistencies—one for use with a caulking gun and the other for application with a caulking or pointing tool. Approved Caulking Contractors are located in the principal cities of the United States and Canada.

Caulking Specifications—Write for detailed specifications.

Preparation—All cleaning or pointing of the building exterior shall be completed, and interior window and door trim shall be set, before caulking is begun.

Application—All caulking, including caulking of the sills, shall be done on the exterior side of the building wall.

All joints around all window and door frames shall be caulked in such a manner as will make them airtight and watertight, with Tremco Caulking and Pointing Compound as manufactured by THE TREMCO MANUFACTURING CO.

The spaces between the masonry, and the outside of frames, around jambs, head and sill shall be filled completely with Tremco Caulking compound, forcing the compound into the opening with the Tremco Hand Caulking Gun, and making a neat, smooth bead, one edge flush with the frame, the other edge flush against the masonry, and not extending more than $\frac{1}{4}$ in. out beyond the face of the frame.

Note: Approved Caulking Contractors are located in principal cities of the United States and Canada.

Pointing Specifications—Write for detailed specifications.

The mason contractor will rake out joints to a depth of $\frac{3}{4}$ in. and width of $\frac{1}{2}$ in. in all features. Before applying Tremco Pointing Compound clean joints thoroughly, then fill these joints with Tremco Pointing Compound manufactured by THE TREMCO MANUFACTURING CO. Force as much Tremco Pointing Compound as possible into spaces in such a manner as will make them weathertight, and finish off neatly and smoothly flush with the masonry.

Tremco Transparent Dampproofing

A positive dampproofing for exposed masonry surfaces above grade, which will not materially change the color or texture of the surface treated.

Transparent Dampproofing Specifications—Write for detailed specifications.

Preparation—Surface shall be clean and absolutely dry. Application should not be made at temperatures below 45° F.

Application—Surfaces to be treated shall be thoroughly pointed before application of Tremco Transparent Dampproofing. All loose mortar joints shall be removed and repointed; all holes and cracks filled; all coping joints pointed; and all window and door frames caulked with Tremco Caulking and Pointing Compound. Tremco Transparent Dampproofing may then be applied in two heavy coats with a brush or spray, allowing the first coat to dry before applying the final coat.

Aquanox 101 Plastic Waterproofing

Specifications for Bedding and Pointing of Stone Copings and Sills—Tops of all parapet walls under stone copings shall be leveled off and smoothed with brick mortar, and when dry shall be given a trowel coat of stone color Aquanox 101 Dampproofing as manufactured by THE TREMCO MANUFACTURING CO. This coat shall be applied at the rate of approximately 1 gal. per 35 sq. ft. so as to entirely cover and seal the tops of the parapet. Coping stones shall be bedded into the compound before same begins to harden, in such a manner that the compound will adhere to the entire bottom surface of the stone.

Stone with exposed top surfaces shall be set with vertical joints dry, caulking face joints with best dry picked oakum and grouting to within $\frac{3}{4}$ in. of the top with equal parts white cement and fine white sand, mixed in small quantities and as thick as can be poured. Joints in top surfaces shall then be pointed with stone color Tremco Pointing Compound.

Tremco Architectural Catalogue

We will be pleased to furnish upon request, the Tremco Architectural Catalogue, containing complete specifications for the proper application of all types of waterproofings and paints, among which are:

Tremco Caulking and Pointing Compound—Non-staining, long lived.

Tremco Glazing Compound—Non-hardening, shock absorbing, made in six colors, ready for use on steel or wood sash.

Tremco Transparent Dampproofing—For building exteriors.

Aquanox 101—For bedding stone sills and coping stones.

Aquanox 202—The positive plaster bond for smooth concrete ceilings.

Cretemix A—Concrete accelerator and anti-freeze.

Cretemix B—Integral waterproofing paste.

Dryfix Foundation Coating—For exterior walls below grade.

Dryfix Plaster Bond Dampproofing—For interior of all exterior walls prior to plastering.

Floral—A preservative and decorative coating that stands heavy foot traffic. For wood, concrete or linoleum floors.

Kemi-Kote—Chemical floor hardener.

Mulsomatic—Heavy duty flooring, light in weight, waterproof, dustproof, resilient, withstands heavy trucking.

ADAMSTON FLAT GLASS COMPANY

Manufacturers of Flat Drawn Sheet Glass

CLARKSBURG, W. VA.

EASTERN SALES OFFICE, 1 Madison Avenue, NEW YORK, N. Y.
WESTERN SALES OFFICE, 11 So. La Salle Street, CHICAGO, ILL.
JOBBER IN PRINCIPAL CITIES EAST OF THE MISSISSIPPI

Product

FLAT DRAWN SHEET GLASS, made in any thickness up to $\frac{1}{4}$ inch.

The Company and Its Facilities

The organization, plant and facilities of the ADAMSTON FLAT GLASS COMPANY inspire the confidence and friendship of every customer. Its sales are largely repeat orders from satisfied customers.

The plant is modern in every respect, equipped with two units, having a capacity of over 1,000,000 boxes per year, which insures prompt and dependable service. It has every facility for the most efficient and economical manufacture of a dependable and uniform product.

Adamston Flat Glass

Adamston Flat Glass is vertically drawn in perfectly flat sheets. There is no curvature whatsoever. It is the same on both sides—no right and wrong side to look for when glazing, and glazing is done at much less expense.

The distinct features of Adamston Glass are:

- (1) Perfectly flat.
- (2) Uniform in thickness and quality.
- (3) Natural fire polish of great lustre.
- (4) The same on both sides.
- (5) Great tensile strength.
- (6) Minimum of breakage.
- (7) Paper packed to prevent scratching.
- (8) Every light of A quality labeled.

"A Brand You
Can Depend On"

(9) Graded according to highest standards.

(10) Sold by representative jobbers in all principal centers.

Uses

For all purposes where perfectly flat glass is required. Not only for the lighting of homes and buildings, but for furniture, display cases, etc.

Grading

Adamston Flat Glass is graded according to the highest standards adopted by flat glass manufacturers of America, and these standards of grading are strictly adhered to.

ADAMSTON FLAT GLASS

All grades	Lights per inch		Av. wt. persq.ft., oz.	Largest size sheet, in.
	Min.	Max.		
Single.....	10	11	20	40 x 50
Double.....	7 $\frac{1}{2}$	8 $\frac{1}{2}$	25	62 x 84
29 oz.....	6 $\frac{1}{2}$	7 $\frac{1}{4}$	29	62 x 96
34 oz.....	5 $\frac{1}{2}$	6 $\frac{1}{4}$	34	62 x 96
39 oz.....	4 $\frac{3}{4}$	5 $\frac{1}{4}$	39	62 x 96
$\frac{1}{4}$ in.....	3 $\frac{3}{4}$	4 $\frac{1}{4}$	52	62 x 96

Service and Distribution

Adamston Flat Glass is generally obtainable from the leading jobbers in the principal cities east of the Mississippi. If the jobber is unable to supply you, write direct to ADAMSTON FLAT GLASS COMPANY, Clarksburg, W. Va.

The company is prepared to furnish any information or offer recommendations to cover any requirements that may be submitted.

Products

LUSTRAGLASS FLAT DRAWN, CLEAR SHEET WINDOW GLASS, ARMOR-LITE SCATTER-PROOF and BULLET-PROOF GLASS, 16-oz. PICTURE GLASS, PHOTOGRAPHIC DRY PLATE GLASS, $\frac{3}{16}$ " and $\frac{7}{32}$ " CRYSTAL SHEET, GROUND and CHIPPED GLASS, TINTAGLASS, IMPROVED QUARTZ-LITE, and BULB EDGE GLASS in double and single strength, as well as $\frac{3}{16}$ " and $\frac{7}{32}$ " CRYSTAL SHEET.

Process and Production

The new flat drawn clear sheet window glass now manufactured by this company is trade named Lustraglass. In our standard single strength thickness it transmits 15% to 20% of the ultra-violet rays of sunlight at 313 mu. (see table below), a better, flatter, clearer, more lustrous glass at no greater cost than ordinary window glass. The greenish cast characteristic of window glass has been almost entirely eliminated. This "whiteness," this absence of color alone, makes Lustraglass a more beautiful, and more desirable glass for windows. Lustraglass is produced by an improved vertical drawn machine process assuring absolute flatness, uniform thickness and quality.

TRANSMISSION IN THE ULTRA-VIOLET SPECTRUM OF LUSTRAGLASS

Determined Radiometrically by Using a Quartz Mercury Arc Lamp, a Quartz Spectrometer and a Vacuum Thermopile

Wave-length	16 oz. (.077 in.)	Thickness (Note A)	
		Single strength (.090 in.)	Double strength (.120 in.)
302 mu.	3.2%	2.3%	.4%
305 mu.	7.5%	5.5%	2.0%
310 mu. (Note B)	16.0%	12.0%	5.5%
313 mu.	22.0%	18.0%	9.0%
315 mu.	26.0%	21.0%	12.0%
334 mu.	73.0%	71.0%	63.0%

Note A: Approximately 75% of all window glass used is in single strength thickness.

16-oz. Superfine and Selected Qualities may be used for small lights and regular window sizes up to 24x30 in. 16-oz. Lustraglass is slightly higher in price.

Percentages given are average for thickness indicated.

Note B: Ordinary window glass is almost entirely opaque at this point of measurement.

"Flatness" (U. S. Government Specifications)

"All clear window glass shall be relatively flat. Slight curvature, provided it is regular, will be allowed,

but the maximum deformation or bow shall not make an arc higher than 0.5% of the length of the sheet. Reverse curve or crooked glass is not allowable."

Flatness (American Window Glass Co. Specifications)

The flat drawn sheet glass produced by the AMERICAN WINDOW GLASS COMPANY's vertical drawn process is positively flat without curvature, bow, reverse curve or deforming roll marks.

Glazing

Lustraglass can be glazed with either side out, with the assurance that the appearance and clear visibility will be of the same high standard whether viewed from the inside or outside of a building.

Chemical and Physical Properties

The chemical properties of Lustraglass assure maximum resistance to discoloration, fade or rust. Tests of the physical properties of this glass demonstrate great tensile strength and a high modulus of rupture enabling it to withstand maximum wind pressures.

Identification Labels

Every genuine light of the new Lustraglass is labeled to identify its genuineness. This is for the protection of the purchaser. In the case of "A" and "AA" quality glass the label bears the letters indicating the quality. In the case of selected and superfine quality 16-oz. picture glass of the AMERICAN WINDOW GLASS COMPANY's manufacture the quality label appears upon the paper between the lights.

Packing

All genuine Lustraglass is packed with paper between the lights to prevent marring and scratching of the surface.

"Specifications for Clear Window Glass for Glazing" (U. S. Government Specifications)

"Clear window glass for glazing is made in several different qualities and in varying thicknesses shown in Table 1.

"Single strength and double strength window glass is regularly supplied in two standard qualities, known as 'A' quality and 'B' quality. A limited amount of glass, known as 'AA' quality, which is especially free from defects, is sometimes selected for special purposes and may be specified if desired. It must be borne in mind, however, that the total amount of 'AA' glass produced by the manufacturers does not exceed 3% of the total amount of window glass produced.

"Window glass is also produced in thicknesses heavier than double strength, and according to its thickness it is classified as (1) 26 oz. glass; (2) 29 oz. glass; (3) 34 oz. glass; (4) 39 oz. or $\frac{3}{16}$ in. glass." Also 45 oz. or $\frac{7}{32}$ in. glass.

"26 oz. and 29 oz. glass is produced only in 'A' and 'B' qualities.

"34 oz. and 39 oz. or $\frac{3}{16}$ in. glass is produced in glazing and auto qualities." This also applies to 45 oz. or $\frac{7}{32}$ in. glass. Note: This Company has discontinued the production of 34 oz. glass."

Grades and Qualities

"AA" Quality (American Window Glass Co. Specifications)—

Because of the very high standard of grading adopted by this company, it is impossible to supply "AA" quality in sufficient quantities to enable us to fill orders for it quickly. Buyers who insist upon having this quality must expect some delay in the shipment of their orders.

"A" Quality" (U. S. Government Specifications)—

"The defects permitted in this quality are faint strings or lines, slight burn, small seeds, small blisters, and light scratches.

"No light shall contain all of these defects, and those present may not be grouped when in the central area of the sheet.

"Strings, lines, or burn specks shall not be of such

intensity that they are visible when observing the sheet at an angle greater than 30 degrees between the line of sight and the glass.

"Waves shall not be visible at an angle greater than 20 degrees with the glass.

"Blisters shall not exceed $\frac{1}{4}$ in. in length unless they occur near the edge of the sheet.

"In general, the central area of the light shall be practically free from defects, and the appearance of the light as a whole shall be such that there is no perceptible interference with the vision as long as one is not looking through the glass at an acute angle."

"A" Quality (American Window Glass Co. Flat Drawn Sheet Glass)—

The improved vertical drawn process developed by this company produces a glass entirely free from many of the defects mentioned in the Government Specifications. This product is also free from deforming roller marks so evident in flat drawn glass produced by other processes, and is relatively free from strings and lines. Lustraglass is a perfectly flat, white, high lustre product of uniform thickness and appearance and will greatly enhance the appearance of any building in which it is used.

"B" Quality" (U. S. Government Specifications)—

"In general, this quality has the same character of defects as 'A' quality, but they may be more numerous and heavier. They should not, however, be so numerous as to prevent a considerable portion of each light from being reasonably free from such defects."

"General Principles Involved in Grading Glass" (U. S. Government Specifications)

"All flat glass contains some imperfections and the principle employed in grading is to exclude all defects that would be objectionable in a given grade. This is difficult to do since there are no sharp lines of demarcation between grades, and experienced inspectors will differ in judgment as the quality of the glass approaches the limits of the grades. Small lights must be quite free from imperfections as compared with larger ones, and the center of any sheet should be clear, whereas the edges may contain more pronounced defects."

Life Science Building, University of California

Glazed with D. S. "A" quality flat drawn sheet glass manufactured by AMERICAN WINDOW GLASS COMPANY
GEORGE W. KELHAM, Architect

Defects Prohibited in All Grades (American Window Glass Co. Specifications)

Defects that mar the general appearance of the glass (considering the quality specified) or cause excessive breakage are prohibited in all grades of window glass manufactured by this company.

"Tolerances in Thickness" (U. S. Government Specifications)

"Thickness of individual sheets shall not vary more than one-half of the total variation allowed for that particular strength of glass as shown in Table 1 for sizes up to 50 united inches. For larger sizes variations in thickness may be equal to the tolerance allowed for that class."

"TABLE 1—TOLERANCES IN THICKNESS AND AVERAGE WEIGHT OF CLEAR WINDOW GLASS"
(U. S. Government Specifications)

	Thickness in in.		Number of lights per in.		Average weight in oz. per sq. ft.
	Min.	Max.	Min.	Max.	
Single strength080	.100	10.5	12.0	18.5
Double strength111	.125	8.0	9.0	24.5
26 oz. glass125	.135	7.5	8.0	26.0
29 oz. glass135	.148	6.5	7.0	29.0
34 oz. heavy glass150	.175	6.0	6.5	34.0
39 oz. heavy glass176	.205	5.0	5.5	39.0

Tolerances in Thickness (American Window Glass Company Specifications)

The new flat drawn process developed and employed by this company enables us to produce a glass that shows little or no variation in thickness—a uniformity which it has been difficult to attain with any other method of manufacture.

"Sizes Obtainable" (U. S. Government Specifications)

The maximum dimensions recommended are:

	Width, in inches	Length, in inches
For Single Strength	40	50
For Double Strength	60	80
For Heavy Sheet	78	120

Note: Single strength glass is made up to 60 inches in length, but we do not take orders for sizes in this thickness larger than 84 united inches.

"Dimensions" (U. S. Government Specifications)

"Glass must be cut to dimensions ordered with an allowable tolerance of $\frac{1}{32}$ in. per $\frac{1}{8}$ in. thickness."

"Heavy Sheet Window Glass, Glazing and Auto Quality" (U. S. Government Specifications)

"The same specifications provided for selecting 'A' quality Single Strength and Double Strength shall apply."

Crystal Sheet Window Glass

All 26, 29 and 39-oz. or $\frac{3}{16}$ -in. as well as 45-oz. or $\frac{7}{32}$ -in. glass produced by this company is known to the trade and sold as Crystal Sheet.

Advantages—Crystal Sheet Glass possesses a brilliant surface, uniform thickness and is one of the flat-test and whitest window glasses produced by any

process. It is an acceptable substitute for plate glass for many uses and is lower in price than polished plate.

Armor-Lite Bullet-proof Glass for Bank Protection

Armor-Lite Bullet-proof provides positive protection against gun fire. It is a beautifully clear, flat glass of brilliant lustre and excellent visibility, designed especially for banks and other places where money is handled.

When ordering Bullet-proof glass be sure to specify Armor-Lite, 1 in. thick, weighing 13 lbs. to the sq. ft. The word Armor-Lite is etched in the corner of all genuine Armor-Lite Bullet-proof Glass.

Armor-Lite Scatter-proof Glass

For automobiles, airplanes, locomotive cabs, busses, street cars, railway coaches, institutes, asylums, skylights, display cases, shelving, table tops and dressers, and industrial buildings.

Armor-Lite Scatter-proof Glass is available in a wide range of sizes, weights, and thicknesses. This is a product of exceptionally high quality.

SPECIFICATIONS OF ARMOR-LITE

Armor-lite	Average thickness, in.	Average weight per sq. ft.
Featherweight (3-ply)120-.130	24-oz.
5-ply170-.180	33-oz.
Sheet drawn single and photo (3-ply)167-.177	32-oz.
Plate and photo (3-ply)192-.202	38-oz.
Sheet drawn single (3-ply)200-.210	40-oz.
Sheet drawn single and plate (3-ply)220-.230	44-oz.
Sheet drawn double and single (3-ply)230-.240	46-oz.
Plate (3-ply)245-.255	50-oz.
Sheet drawn double (3-ply)265-.275	56-oz.
Bullet-proof (3-nly)	1.020-1.030	13-lbs.

Note: The foregoing specifications apply only to the finished product.

Armor-Lite—5-Ply

This, a new development in scatter-proof safety glass, is made of three thicknesses of very thin glass and two of celluloid. This special combination, developed and manufactured only by the AMERICAN WINDOW GLASS COMPANY, provides a clear glass, free from distortion, measuring just a fraction over $\frac{1}{16}$ in. over all, weighing 5 to 10 oz. per sq. ft. less than 3-ply sheet drawn or polished plate. Armor-Lite 5-ply provides a great measure of protection without added weight or thickness.

Tintaglass

A laminated glass product furnished in a variety of beautiful colors for decorative purposes—wall tile—table and dresser tops—shelving, display cases, etc.

Suggested Specifications

All window glass used in this building shall be Lustraglass, a product of AMERICAN WINDOW GLASS COMPANY, and shall be (here specify the thickness and quality of glass desired). The Lustraglass label must appear on each light. All "AA" and "A" quality Lustraglass will be identified as such on the label.

Note: If the AMERICAN WINDOW GLASS COMPANY's glass is specified, this company upon request will inspect the installation and without expense report whether the glass furnished is the kind, quality, and thickness specified.

Roosevelt Junior High School, Hamilton, Ohio

F. G. MUELLER and WALTER R. HAIR, Associate Architects
Glazed with D. S. "A" quality flat drawn sheet glass manufactured by AMERICAN WINDOW GLASS COMPANY

Manufacturing

The usual ingredients in the manufacture of window glass, i.e., sand, ground limestone, soda ash, salt cake, and a certain amount of cullet or broken glass, are scientifically and mechanically mixed and fed into the furnace in such proportions as will guarantee in the finished product the utmost strength, durability and freedom from defects, particularly that of stain or fade.

These raw materials, after being melted at a temperature of 2600 degrees, in furnaces containing about 2400 tons of molten glass, pass into the refining zone in the form of molten metal and thence into the drawing canals.

The machines are so located on these canals that the operation of any one machine cannot impair the quality or affect the production of glass on any other machine. This arrangement of the machines, by which the glass for each machine is maintained at the same temperature, is one of the outstanding developments of the A. W. G. Co.'s process, and one which assures uniformity of quality and thickness.

Drawing the Sheet—To begin this operation the machine is reversed and a metallic bait is lowered and immersed in the molten glass for a few seconds until the glass has adhered thereto. The machine is then placed in upward motion and the bait, with glass adhering to it, is drawn upward through successive pairs or gear driven rolls, the speed of draw determining the thickness of glass desired.

These cylindrical rolls, which provide traction power when once the bait is removed, are made of the finest quality of specially treated asbestos, so that at no time do they mar the surface or spoil the high lustre of the glass acquired during the first few feet of draw. Roll marks and impressions are absolutely eliminated in this process.

This process, perfected by the AMERICAN WINDOW GLASS COMPANY, produces a glass that is perfectly annealed and is uniformly satisfactory as to finish and cutting properties.

At the top of the drawing machines the glass is cut off the upward moving sheet in the desired lengths and laid on a felt-covered table where the bulbed edges are stripped off. In this operation the glass is handled only once from the time it leaves the tank as molten glass until it is laid on the cutting table, also felt-covered, thus eliminating any chance of marring or scratching the surface.

Inspection—The glass, after being cut and inspected by experienced cutters, is re-inspected by men especially trained for that work. The quality is again checked by the chief inspector.

Specialties (Manufactured by the American Window Glass Company)

Armor-Lite Bullet-proof Glass for bank protection.
Armor-Lite Scatter-proof Glass for automobiles and airplanes.

Photo Glass for camera use, lantern slides, and diagnostic X-ray plates.

Tintaglass. Send for special circular.

$\frac{3}{16}$ in. and $\frac{7}{32}$ in. Crystal Sheet. An economical substitute for plate glass.

Bulb Edge Glass. For shelving, window ventilators, counter partitions and wherever glass is used without a frame.

Improved Quartz-Lite, Ultra-Violet Ray Glass for windows.

Picture Glass, 16 oz., in superfine and selected qualities.

Ground Glass, double strength. Produced by sand-blasting or grinding one surface of the sheet.

Process Chipped Glass No. 1 and No. 2. Chipped glass is produced by processing the surface so that a chipped appearance is produced. No. 1 process chipped glass indicates that one process of chipping is applied to one surface. No. 2 process chipped glass indicates that one surface is chipped twice.

The reverse side of both ground and chipped glass is smooth. Glazed with the smooth side out.

Libbey-Owens-Ford Flat Drawn Clear Sheet Glass

Libbey-Owens-Ford Flat Drawn Clear Sheet Glass for windows is made by an exclusive process—absolutely without bow, uniform in thickness and strength—with a fire finish of brilliant, sparkling lustre. Because of unusual care in annealing, this glass can be cut, handled and glazed with a minimum breakage; because it is truly flat, it can be glazed either side out.

Qualities and Grades

— Libbey - Owens - Ford manufactures flat drawn clear sheet glass in several different qualities and varying thicknesses. Single strength and double strength sheet glass is regularly supplied in two standard qualities, known as "A" quality and "B" quality. Libbey-Owens-Ford does not recommend the lower qualities of glass, although they can be furnished in limited quantities when desired.

Thicknesses—Libbey-Owens-Ford produces three strengths or thicknesses of sheet glass—single strength or 19 oz., double strength or 26 oz., and heavy sheet or $\frac{3}{16}$ in. weighing 39 oz. per square foot.

Tolerance in Thickness—All Libbey-Owens-Ford glass is produced by an exclusive continuous-drawing process. This results in Libbey-Owens-Ford glass being much more uniform in thickness.

Flatness—Libbey-Owens-Ford sheet glass is naturally flat. The process of manufacture draws the glass into a flat sheet directly from the molten state.

Glazing—Government specifications state that window glass shall be glazed with the convex side out. Libbey-Owens-Ford glass can be glazed with *either* side out as it is truly flat—there is no convex side. This saves considerable time and minimizes breakage.

Cutting—Libbey-Owens-Ford sheet glass is easy to cut. This means that breakage is reduced to a minimum.

Inspection—Careful inspection insures the uniform high quality of Libbey-Owens-Ford sheet glass. All "A" quality glass is inspected and then re-inspected to insure its measuring up to the exacting requirements set by Libbey-Owens-Ford.

W. W. Porch Residence, Houston, Tex.
CHARLES W. OLIVER, Architect
Glazed with Libbey-Owens-Ford Sheet Glass

Labels—Libbey-Owens-Ford originated the practice of labeling glass. Each light of "A" quality double-strength Libbey-Owens-Ford glass bears the L-O-F blue label. Each light of "A" quality single-strength Libbey-Owens-Ford glass bears the L-O-F red label.

Packing—Libbey-Owens-Ford glass is packed with straw in boxes, each containing 50 sq. ft. of glass regardless of the size of the sheets. All "A" quality Libbey-Owens-Ford glass is packed with sheets of paper between the lights to protect its brilliant lustre.

How to Specify Libbey-Owens-Ford Sheet Glass—All sheet glass, unless otherwise noted, shall be Libbey-Owens-Ford "A" Quality DS/SS. Each light shall bear the Libbey-Owens-Ford label.

	Thickness, in.		Number of lights per in.		Average weight per sq. ft., oz.

Empire State Building, New York, N. Y.
SHREVE, LAMB & HARMON, Architects
Glazed with Libbey-Owens-Ford Polished Plate Glass

Libbey-Owens-Ford Polished Plate Glass

Libbey-Owens-Ford Polished Plate Glass is manufactured in four qualities—first silvering quality, second silvering quality, mirror glazing quality, and glazing quality.

It is available in both $\frac{1}{8}$, $\frac{3}{16}$, and $\frac{1}{4}$ -in. thicknesses. It is supplied in all sizes for building purposes.

How to Specify Libbey-Owens-Ford Polished Plate Glass—All polished plate glass shall be glazing quality as manufactured by the LIBBEY-OWENS-FORD GLASS COMPANY in accordance with the U. S. Government specifications.

Libbey-Owens-Ford Shatter-Proof Safety Glass

While Libbey-Owens-Ford Safety Glass was primarily developed for automotive use, architects throughout the country are daily discovering new uses for it in connection with various building projects. It consists of two sheets of high quality glass with a sheet of trans-

parent clear vision plastic bonded between them. In case of an impact it will not fly into fragments. In locations where a severe wind storm or hail storm might break ordinary glass, making replacement necessary immediately, Libbey-Owens-Ford Shatter-Proof Safety Glass remains intact.

It is available as safety plate glass or safety sheet glass. Sizes for various building uses are cut to specifications.

Libbey-Owens-Ford Bullet-Proof Glass

The use of bullet-proof glass is becoming increasingly important in connection with bank counters, vaults, etc. For this purpose Libbey-Owens-Ford is manufacturing a special bullet-proof glass, available in sizes and thicknesses appropriate for this work.

Libbey-Owens-Ford Colored Laminated Glass

Libbey-Owens-Ford manufactures a colored laminated glass for decorative purposes. This decorated laminated glass is available in a wide variety of color effects and is particularly suited to furniture tops, shelving, bathroom decoration, etc.

PITTSBURGH PLATE GLASS COMPANY

Pennvernion Flat Drawn Window Glass

PITTSBURGH, PA.

For Warehouses and Branch Offices, see our pages on Vista Plate Glass
For our Other Products, see Manufacturers' Index

Development

The PITTSBURGH PLATE GLASS COMPANY, which has long been known as one of the world's largest plate glass manufacturers, recently turned its attention to the manufacture of window glass. The tremendous resources of this company were employed in the development of a sheet glass which embodies all of the improvements made in window glass manufacturing methods during the last few years. The company went farther than this by instituting other improvements, which have caused architect after architect to state that this new flat drawn sheet glass is the finest, the most brilliant, and the most consistent in quality of any window glass he has ever seen.

Manufacture

Due to its method of manufacture by a new patented process, Pennvernion Window Glass is absolutely flat. It cannot be otherwise, for at no time from when the white molten sheet leaves the tank until it emerges from the vertical annealing oven does it depart from the perpendicular. It is born flat and kept flat. No more blowing of cylinders, no more splitting, reheating, flattening and finally cooling of the glass; for now the sheet moves steadily, drawn directly upward between ever moving rollers, as though gripped by an invisible hand. Upward the sheet rises, hour after hour, day after day, the same even thickness, the same brilliant lustre. Gone are the old bowed surfaces, the surface burns, the uneven thickness, the "strings," the extreme waviness, so long identified with window glass. In their place is a flatness and brilliancy never before believed possible in a fire-finished glass. The manufacturing is supervised by the same organization which has made other products of the PITTSBURGH PLATE GLASS COMPANY standard throughout the country.

The results of this new process are plainly evident in the appearance of the glass itself. Pennvernion Window Glass has a new uniformity of quality—an unusual flatness of surface, clear transparency, and even thickness. Even more striking is the high lustre, the brilliant

PENNVERNION FLAT DRAWN WINDOW GLASS

The Window Glass Machine

fire polish on both sides. There is no wrong side. Special methods of treating this product prevent staining and loss of lustre. Due to the perfect flatness of this window glass, it is easier to cut, either side may be glazed outward, breakage is reduced to a minimum and time is saved in the glazing operation. The surface undimmed by bending or refractories, Pennvernion Window Glass, we believe, embodies the last word in modern methods of window glass manufacture.

Thickness

Tolerances in thickness of Single and Double will be as per the U. S. Government Standards: 10.5 to 12 lights to the inch for Single and 8 to 9 lights to the inch for Double.

Qualities

U. S. Government Standards apply throughout.

A.A.—The best quality obtainable in window glass. Higher than a commercial necessity.

A.—The highest grade for special commercial uses. Contains no defects to perceptibly interfere with straight vision.

B.—Glass free from glaring defects, but containing such imperfections as prevent its being graded as "AA" quality or "A" quality.

Fourth Quality—Containing such defects as eliminate it from "B" quality standard, but too good to be branded "C."

C.—Glass of inferior quality but not containing stones, heavy cords, or other imperfections serious enough to cause breakage in shipment.

Steel Sash—Specially selected for the requirements of this class of work. Defects so located as not to obstruct light transmission.

Greenhouse—A special quality selected with reference to the elimination of defects injurious to growing plants.

Labels

The Pennvernion label (red on single strength, green on double strength) identifies a superior product. These labels are used on all "A" and "AA" quality glass and should be left on until inspected by your superintendent, for they are your guarantee of quality.

Packing

All "A" and "AA" quality glass is paper packed to insure retaining its brilliant lustre. Glass is shipped in boxes of 50 sq. ft. in sizes up to 100 united inches and 100 sq. ft. in larger sizes, with the name Pennvernon, quality, thickness and size clearly stenciled on one end of the box. Boxes are constructed of the best commercially dry lumber with heavy bottoms on larger sizes and cleats on smaller sizes which insure strength with light weight. Glass is embedded in clean rye straw completely protecting it against careless handling.

Cross Section of Glass Machine Showing the Sheet of Glass Being Drawn

A-A—The sheet of glass. B—Skim bar. C-C—Draw bar. D-D—Water coolers to chill the sheet. E-E—Machine case. F—Cut-off wire. G—Edge cut-off. O-O—Asbestos-covered rolls.

At the Top of the Machine Pennvernon Window Glass Emerging as a Finished Sheet

Specifications

When specifying window glass, use the following paragraph to insure the highest grade:

Except where otherwise specified, all openings shall be glazed with Pennvernon Window Glass, flat drawn. Quality and thickness to be as specified in detail on plans. Where "A" quality is specified, all glass shall bear the Pennvernon label until approved by the architect. Where other qualities are used, glass shall be delivered to the job in original packages with Pennvernon and quality of glass stenciled thereon. All glass shall be properly set, well sprigged, puttied and back puttied with the best oil putty. When metal sash is used, glaze with best Steel Sash Putty.

Additional Information

Immediate deliveries are obtainable on large as well as small orders through the company's numerous warehouses located in leading industrial centers throughout the country.

Additional literature and information on Pennvernon Window Glass may be secured from our warehouse serving your territory. Send for attractive new book describing the manufacture of this new Window Glass.

PITTSBURGH PLATE GLASS COMPANY

Helioglass—An Ultra-Violet Ray Window Glass

PITTSBURGH, PA.

For Warehouses and Branch Offices, see our pages on Vista Plate Glass

For our Other Products, see Manufacturers' Index

Helioglass — An Ultra-Violet Ray Window Glass

Helioglass is a nationally advertised ultra-violet ray transmitting glass, which is being recommended by leading physicians throughout the country because of its ability to transmit a large percentage of the ultra-violet rays which are shut out by ordinary window and plate glass. These vital rays are present in varying degrees in the sun's atmosphere at all times during the year, and are valuable in the proper physical development of children, as an adjunct to the recovery of the sick, and to promote well being in the average adult.

A Modern Necessity

Helioglass is a sheet glass, similar in appearance to any other handblown window glass (except that it is slightly more transparent than the ordinary product), but it is permeable by the lower ultra-violet rays. It is this special property which makes Helioglass an important item in the planning of hospitals, schools, homes, greenhouses and offices. Any of the above buildings, without some or all of the windows glazed with Helioglass, are not up-to-date. Your client may not be informed as to the value of Helioglass, but you will be doing him a favor by insisting that Helioglass be used in a portion of his building.

Proper Use of Helioglass

We do not recommend that Helioglass be used indiscriminately, but that it be used in windows where there is an open exposure to the sky, and in windows of rooms where the occupants spend a large portion of their time.

While it is not necessary to have a southern exposure, this feature is desirable, inasmuch as it has been computed that the ultra-violet radiation from a northern exposure is approximately 60% as great as from a southern exposure. By all means use the southern exposure when and where possible, but do not disregard the benefits to be derived from a northern exposure.

Therapeutic Value

The fact that light transmitted through Helioglass is more beneficial to living organisms than the same light filtered through ordinary glass has been definitely proven by physiological tests.

Dr. W. H. Eddy, Professor of Physiological Chemistry at Columbia University, New York City, recently conducted a series of experiments which showed conclusively that light transmitted through Helioglass completely protected rats from harmful effects while fed on a rickets producing diet, whereas rats fed on the same diet and kept under ordinary window glass readily succumbed to the effects of the lack of the valuable vitamin "D."

Similar tests conducted by the Food Research Laboratories, Inc., of New York City, had the same results and pointed to the further conclusion that Helioglass had marked therapeutic value even during the winter months in New York City, when the intensity of ultra-violet light is notoriously low.

The complete reports of both these tests are embodied in an interesting new booklet which will be sent on request.

Efficiency of Helioglass

A series of spectrum analysis tests conducted by Dr. D. C. Stockbarger of the Massachusetts Institute of Technology prove conclusively that although Helioglass loses some of its transmission properties with age, it continues to transmit permanently over 50% of the rays at 3025 AU. after com-

Helioglass Was Installed in Hahnemann Hospital, Philadelphia, Pa.

PETTIT & FERRIS, Architects
H. HALL MARSHALL, Consulting Engineer
IRWIN & LEIGHTON, Contractors

plete solarization. The reduction of the percentage of transmission is due to a chemical change which takes place in the composition of the glass caused by the action of the actinic rays of the sun. However, once the change has taken place, continued exposure has no further effect on the glass and the rate of transmission remains constant.

General Characteristics

Helioglass does not discolor with age, nor is it affected by washing any more than is ordinary glass. While the surface of Helioglass is not equal to that of plate glass, it is quite satisfactory for ordinary glazing. The tensile strength of Helioglass is approximately that of window glass of the same thickness.

Important Facts to Know About Helioglass

NEW YORK, N. Y.

Vita Glass

A number of years ago science discovered that ordinary window glass sapped the health-giving and vital part of light—the short ultra-violet rays. This fact attracted the attention of scientific minds the world over . . . The problem was to make a glass which would *permanently* let through an effective quantity and quality of this health-giving part of natural sunlight and which had all the physical characteristics—strong wearing quality and appearance of ordinary glass of fine quality. Vita glass, developed in 1924, met this need.

Original Ultra-violet Ray Transmitting Glass

Vita glass was perfected in 1924 by Professor F. E. Lamplough, M. A., Trinity College, Cambridge, England, only after prolonged experimentation. He called it "Vita glass" because of the characteristic of passing the *vital* rays of sunlight.

It is manufactured in the usual forms—*clear, cathedral, plate and wire*. Cathedral Vita glass gives slight diffusion and indirectness of vision and is used where obscure or translucent glass is desirable. Its transmission of light and of ultra-violet rays is the same as clear Vita glass.

Vita Glass Labels

Each light of genuine Vita glass bears red, blue and black labels in the design above.

Uses

Wherever people spend their daylight hours indoors, as in homes, offices, apartments, hotels, schools, factories, hospitals, sanitariums and sanatoria. Its properties make it equally valuable to plant and animal life so that its use can be advantageously extended to zoos, stables, greenhouses and particularly chicken-houses.

Price

The price of Vita glass is not subject to the fluctuation of the general glass market. All Vita glass is sold on a square foot basis, the price varying according to the size of the light and the quantity. Quotations may be obtained on request.

For Conservatory and Solarium Glazing

Certain prominent designers and builders of conservatories and solariums are featuring Vita glass in special cases, using their standard forms of construction, but glazing with Cathedral Vita glass on the roof and clear Vita glass on the sides.

Any existing conservatory or solarium can be converted into a real health solarium by replacing the ordinary glass with Vita glass. Complete information on manufacturers employing Vita glass for this purpose will be given on request.

Transmission Qualities Are Permanent

After it is installed, Vita glass goes through a short period of "seasoning"—a chemical action. This "seasoning" takes place during the first two or three weeks after installation. Thereafter its transmission of an effective quantity and quality of ultra-violet rays is permanent and fixed. This fact is substantiated by the U. S. Bureau of Standards, Prof. Stockbarger of Massachusetts Institute of Technology and other leading physicists here and in England and is guaranteed by the VITAGLASS CORPORATION. The effectiveness of Vita glass after its "seasoning" period has been proved by thousands of users and by a conclusive number of authoritative controlled biological tests over the

past six years.

Thickness, Weight and Sizes

Clear Vita glass has a nominal thickness of 1/9 in., weighs approximately 21 oz. per sq. ft. and can be supplied in sheets up to 40x60 in., although its use in lights of this size is not recommended. For small lights the privilege is reserved of supplying clear Vita glass weighing 16 to 19 oz. per sq. ft. In weight, strength and appearance clear Vita glass is like ordinary window glass of corresponding thickness and can be glazed in the same sizes and in the same manner.

Cathedral Vita glass can be supplied in 1/8 and 1/4 in. thicknesses and in sizes up to 40x96 in.

Vita plate glass is 3/8 in. thick and can be supplied in lights up to 25 sq. ft. in area—larger sizes ordered specially.

Georgian Mesh Vita wire glass is 3/8 in. thick and can be supplied in sizes up to 40x90 in. This glass has 1/2 in. square mesh—attractive appearance.

Adequate stocks of Vita glass are now carried in this country by the corporation and its distributors.

Specifications

Ultra-violet transmission glass, where noted on plans, shall be clear, colorless Vita glass as distributed by the VITAGLASS CORPORATION, New York City. For identification, each light shall bear at least one red, blue and black Vita glass label, or shall be etched Vita. Vita glass to be glazed with the labels on the inside, and at least one label to remain on each light for the inspection of the architect. Such small bubbles and other slight imperfections as cannot be avoided in the manufacture of this glass shall not prevent its acceptance.

Where a polished plate Vita glass, or Vita glass with cathedral finish, is specified, it must meet the usual quality requirements for such glass.

*VITA is the trade-mark (Reg. U.S. Pat. Off.) of and indicates glass and glassware manufactured for and sold by VITAGLASS CORPORATION, New York, N. Y.

BULLET-PROOF GLASS

MANUFACTURED BY
SAFETEE GLASS COMPANY

Broad Street and Poplar, PHILADELPHIA, PA.

Product

SAFETEE BULLET-PROOF GLASS for Bank Enclosures and other places subject to the sudden attacks of robbers.

Holdup Men Get \$28,000

A familiar enough headline and one that statistics show will be repeated with variations, within the next and succeeding hours.

To prevent this enormous loss of property, new and more efficient methods of protection are necessary—methods that will eliminate the factor chiefly responsible for the success of most holdups—intimidation.

This requires that the employee be placed beyond the reach of the bandit's bullet. Safetee Bullet-proof Glass does just this, while at the same time it interferes in no way with the employee's ordinary duties.

Advantages of Safetee Bullet-Proof Glass

When used in bank partitions, tellers' windows, etc., separating the public space from the working space, Safetee Bullet-proof Glass provides absolute protection to moneys, securities, etc., and to personnel, in the event of an attempted holdup.

Safetee Bullet-proof Glass will stop a .45 calibre metal jacketed pistol bullet fired

Safetee Glass
WON'T SHATTER OR FLY
TRADE-MARK

Four Shots Shown on Glass
Test Pistols of the Highest Calibre
Have Proved Ineffective in Penetrating Safetee Bullet-proof Glass

Illustration is from a photograph, unretouched, showing the effect of test guns with high calibre bullets fired at close range. None of them went through the glass.

at close range from an automatic pistol. This has been well proven in numerous tests.

A sample of this glass, size 12x20 in., stopped three of these bullets at 3-ft. distance. This sample is still intact, notwithstanding the fact that test was made five years ago. The integrity of Safetee Glass is not impaired when cracked.

Bandits depend largely upon intimidation to help them in making a "haul." When an employee stands behind Safetee Bullet-proof Glass he is out of harm's way and therefore can not be intimidated. If he can not be intimidated, the holdup can not be successful.

Banks and cars protected by Safetee Bullet-proof Glass are left alone by bandits—they pick easier prey.

For all practical purposes Safetee Glass is as fully transparent as the best quality polished plate glass. It is not wire inserted.

And no less important than the practical advantages above listed is the fact that Safetee Glass does not detract in the slightest from the artistic effect demanded in bank fixtures.

Service

We will be glad to co-operate with the architect in furnishing suggestive designs for any desired installation, together with detailed drawings and estimates.

Construction Features

Safetee Bullet-proof Glass is made up of 5 layers of material, consisting of 3 pieces of polished plate glass and 2 binding layers, the whole welded together under high temperature and tremendous pressure.

The resulting product is a perfectly solid sheet of glass possessing great strength and resiliency.

When struck a sharp, heavy blow the cushioning effect, resulting from the laminated construction, prevents the glass from shattering and the missile from penetrating.

As shown in tests and in actual use strong impacts cause a multiple of hairlike cracks, but no breaks or splinters.

Safetee Bullet-proof Glass can be furnished in sizes up to 34x62 in. The thickness is 1 in. Allowance should be made for a variation of $\frac{1}{8}$ in. plus or minus in thickness.

PLATE GLASS MANUFACTURERS OF AMERICA

First National Bank Building
PITTSBURGH, PA.

Why Plate Glass for Windows

The primary purpose of glass in windows is to admit light, to afford protection from the elements and to allow a clear vision. The most suitable glass is that which will transmit the greatest amount of light and afford the clearest view.

Plate Glass is not merely a good quality glass. It is a unique product: a glass *ground and polished* to a truly flat surface and lustrous finish.

Plate glass does not distort objects viewed through it at any angle.

In addition to practical advantages, plate glass has another advantage which is receiving more and more consideration from architects, that is, advantage of beauty. This quality of beauty is due to the clean-cut and distinct reflection free from distortion.

Plate glass increases the value of a building or a residence far more than the additional cost of the plate glass. A building glazed with plate glass is more easily rented or sold.

Economies of Plate Glass

Breakage—Because of its higher strength and its resistance to blows, plate glass does not break easily.

Cleaning—Its highly polished surface allows cleaning with less labor.

Quiet—Its extra thickness keeps out more noise and insures quieter rooms.

Heating—Since plate glass is ordinarily thicker, it reduces heat losses.

Beauty—Crystal clear—no distortion of objects viewed through it. Looking through plate glass is like looking through the open air itself—the eye is not conscious of its presence.

Cost—Total cost of glazing is only about one per cent of the total cost of the building. The additional cost for plate glass is a negligible proportion of the total cost.

Construction Details for Plate Glass

When making designs calling for the use of plate glass, several items of construction details must be considered.

(1) Supporting structure must be sufficiently strong and rigid to withstand any wind pressures, vibrations and other strains that might exist.

(2) Provision must be made for expansion and contraction, particularly in large sheets.

(3) Provision must be made for easy replacement in case of breakage.

(4) Do not locate a large sheet where it will be difficult to set.

(5) Provide ventilation on both sides of glass. This ordinarily does not require consideration, but in wainscoting and with mirrors, ventilation on the back is important—do not set glass or mirrors in a surface to surface construction.

(6) Provide accessibility for cleaning.

Care of Plate Glass Before Setting

In writing his specifications, the architect should provide not only that plate glass is to be used but that proper care should be exercised that it shall not be damaged before setting. The following items should be covered:

(1) Plate glass shall not be laid flat but shall be stood on edge with paper between sheets.

(2) Glass shall not be laid flat (for cutting or other purposes) upon a table or other object that has not been previously covered with a clean, soft protection of some sort.

(3) No dust or dirt shall be allowed to accumulate upon glass.

(4) Plates shall be handled one at a time and surfaces shall never be allowed in contact.

(5) Glass shall be unpacked as soon as delivered, cleaned and dried if necessary, and stored on edge in a dry place. This to avoid what is known as "stain."

(6) Alkalis attack the polished surface of plate glass and should not be allowed near it—especially is this true of ammonia fumes.

Reflections of Lights and Shadows
on Polished Surfaces of Plate
Glass

United States Government Specification for Plate Glass for Glazing Purposes

Classification

Polished Plate Glass: second silvering quality, glazing quality.

Definitions of the General Classes of Polished Plate Glass

Plate Glass. Transparent, flat, relatively thin glass having plane polished surfaces and showing no distortion of vision when viewing objects through it at any angle.

Plate Glass is made at present by casting and rolling large sheets periodically or by rolling a continuous sheet. The sheets are then ground and polished.

Detailed Specifications of Polished Plate Glass

General Principles Involved in Grading Glass—All flat glass contains some imperfections and the principle employed in grading is to exclude all defects that would be objectionable in a given grade. This is difficult to do since there are no sharp lines of demarcation between grades, and experienced

inspectors will differ in judgment as the quality of the glass approaches the limits of the grades. Small lights must be quite free from imperfections as compared with larger ones, and the center of any sheet should be clear, whereas the edges may contain more pronounced defects.

Method of Examination—The method of examination is described in these specifications in order to make the results more uniform, and defines the condition under which glass should be examined because the distance from the glass, the angle between the glass and the line of sight, and the intensity of light all affect the visibility of imperfections.

These specifications should be interpreted by examining the glass in the following manner, with reference to the definitions of defects listed in the glossary:

The glass should be examined when placed in a position similar to that of a glazed light with the observer's eye on a level with the center of the sheet, and looking through the glass from a distance of about 36 in. into the light from a clear sky without any sun or any close background.

The visibility of waves, lines or cords depends chiefly upon

the angle of observation, and the intensity of these defects can be classified on this basis. The values given for angles are the angles the line of sight makes with the sheet of glass when in a vertical position. Slight movement of the head horizontally through an angle of two or three degrees will make waves or lines more perceptible.

Acceptance or Rejection—Acceptance or rejection of a shipment or delivery shall be based on an examination of the following quantities:

For orders of 100 lights or less, all shall be examined; for orders of 101 to 500 lights, at least 50% shall be examined, for orders of 501 or more lights, at least 25% shall be examined. Boxes shall be selected from the shipment at random.

If not more than 10% of the lights examined are below quality, the shipment shall be accepted provided the lights below the specified grade are not distinctly below the upper limit of the next lower grade.

If, however, an entire shipment of 500 lights or more is examined, not more than 5% may be below quality.

Specifications for Polished Plate Glass

Sizes and Thickness—The standard of thicknesses of plate glass shall be $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, 1, $1\frac{1}{4}$ and $1\frac{1}{2}$ in. Sheets are available $\frac{1}{4}$ in. thick in sizes having a maximum area of 250 sq. ft. Glass of $\frac{1}{4}$ -in. thickness may be furnished having almost any desired dimension under the following maximums: 120x280 in., 144x260 in., 160x240 in.

The standard stock thickness for glazing purposes is $\frac{1}{4}$ in., but this may vary between $\frac{3}{8}$ and $\frac{5}{8}$ in.

Tolerance in Thickness—When a certain thickness is specified for a specific purpose, the tolerance in thickness shall be half the difference allowed on standard thickness, although $\frac{1}{4}$ -in. glass for glazing purposes is accepted within the latitude of $\frac{3}{8}$ to $\frac{5}{8}$ in. The general variation in thickness should not be more than $\frac{1}{8}$ in. for individual lights under 10 sq. ft., in thickness up to $\frac{1}{4}$ in. The variation in lights over $\frac{1}{4}$ in. in thickness should not exceed one-half the total tolerance for that thickness.

Polished plate glass $\frac{1}{8}$ and $\frac{1}{4}$ in. thick is carried in stock in the larger cities.

Tolerances in Dimensions—Variation from dimensions ordered shall not be more than $\frac{1}{8}$ in. per $\frac{1}{8}$ -in. thickness.

Grades—Plate glass shall be furnished for glazing purposes in one of two grades as specified. These grades will be known as second silvering and glazing qualities.

Second silvering quality is invariably used where the highest standard of glazing is required and imperfections are discoverable only on close inspection. This quality is rarely sold for glazing purposes in sizes over 20 sq. ft. Glazing quality represents the usual selection of plate glass supplied when quality is not otherwise definitely specified.

As allowable tolerances in quality must vary considerably with size of sheet required, different specifications will apply in each of the following four divisions according to size:

Division I. Sheets up to and including 10 sq. ft. in area.

Division II. Sheets having an area greater than 10 sq. ft. but not greater than 25 sq. ft.

Division III. Sheets having an area greater than 25 sq. ft., but not greater than 75 sq. ft.

Division IV. Sheets having an area greater than 75 sq. ft.

Division I. (Sizes Up to and Including 10 Sq. Ft.)—Second Silvering Quality—This glass shall not contain any major defects. The central area of this glass may contain only well scattered seeds. Ream, skim, short finish, and scratches which can not be removed by buffing, are not permissible. The edges may contain coarse seeds, but none shall be larger than $\frac{1}{8}$ in. in diameter.

Glazing Quality—The central area of this quality may contain numerous scattered seed, including an occasional coarse seed, but no heavy seed. Small bubbles may occur on the edge. Stones, large bubbles, skim, ream, or long or heavy scratches are not permissible. Faint strings in the corners or upper edge of the light are permissible. The polish shall not show areas of short finish.

Division II. (Sizes from 10 Sq. Ft. to 25 Sq. Ft., Inclusive)—Second Silvering Quality—The central area of this quality may contain more numerous fine seed than the small sizes and an occasional coarse seed. The edges may contain occasional small bubbles and fine strings. No heavy defects or scratches which can not be removed by buffing are permissible. The polish must be good and free from visible short finish.

Glazing Quality—The central area may contain small bubbles and fine strings or ream which do not give visible distortion when looking straight through the glass, but no long or heavy scratches. The edges may contain bubbles over $\frac{1}{8}$ in., visible scratches shorter than 10 in., small areas of ream, strings,

and small stones not larger than $\frac{1}{8}$ in., but these defects should not be grouped nor interfere with the vision. The polish over the central area should be good, but patches of light short finish may be present about the edges.

General—None of the above grades or sizes may contain any heavy or long lines, streaks of ream, any bubbles larger than $\frac{1}{8}$ in., visible poor polish, open bubbles, areas of skim, or stones over $\frac{1}{8}$ in. in diameter.

Division III (Sizes from 25 Sq. Ft. to 75 Sq. Ft.)—Glazing Quality—Lights of this size may contain numerous visible and larger imperfections not allowed in the smaller lights. But these must not be grouped or so prominent that they noticeably interfere with the vision. The central area of the plate shall be free from these larger defects.

The sheets may contain seed of any size, but not heavy seed except in relatively small patches on the outer border of the sheet, occasional bubbles up to $\frac{1}{8}$ in. in the center and up to $\frac{1}{4}$ in. on the borders, strings, ream and skim in very limited areas if not causing a deformation of objects viewed through the plate, occasional scratches and small stones under $\frac{1}{8}$ in.

Heavy ream, heavy cords, bubbles larger than $\frac{1}{8}$ in. in diameter, stones larger than $\frac{1}{8}$ in. in diameter, large fire cracks, areas of unpolished glass, easily visible poor polish, large open bubbles, or sand holes, are not permitted. The large defects should be confined to the upper edge and upper corners of the sheet, the lower and central areas to be relatively free from major defects.

Division IV. (Sizes Greater than 75 Sq. Ft.)—Sheets larger than 75 sq. ft. may contain defects of almost any kind except that they must not show large areas of heavy seed or bubbles, nor have any defects which will cause spontaneous breakage, such as skim or large stones ($\frac{1}{8}$ in. in diameter) or show any areas of unpolished glass.

Glossary of Terms Used in These Specifications

The following terms shall be used in specifications:

Plate Glass—Seeds, short finish, skim, strings, scratches, bubbles, open bubbles, ream, stones, fire cracks, sand holes.

Bubbles—Gas inclusions in any rolled glass. These inclusions are practically always spherical and brilliant in appearance. The term applies to all such inclusions larger than $\frac{1}{8}$ in. in diameter. The term small bubbles (commonly known as boil) refers to sizes between $\frac{1}{8}$ in. and $\frac{3}{8}$ in.

Seeds—Minute bubbles less than $\frac{1}{8}$ in. in diameter. Fine seeds are visible only on close inspection, usually appearing as small specks and are an inherent defect in the best quality of plate glass. Seed about $\frac{1}{8}$ in. to $\frac{3}{8}$ in. in diameter are usually considered as coarse seed.

Open Bubbles—Bubbles which have been broken into by grinding, leaving a hemispherical hole in the glass surface.

Skim—Streaks of dense seed with accompanying small bubbles.

Strings—Wavy, transparent lines appearing as though a thread of glass had been incorporated into the sheet.

Cords—Heavy strings incorporated in the sheet, occurring without any regularity of direction, and appearing to be of considerable thickness rather than on the surface.

Ream—An area of unhomogeneous glass incorporated in the sheet producing a wavy appearance.

Scratches—Any marking or tearing of the surface appearing as though it had been done by either a sharp or rough instrument. Scratches occur on sheet glass in all degrees from various accidental causes.

Short Finish—Insufficient polish or lack of brilliancy; improperly finished surface which has the appearance of being slightly pitted and wavy when the surface is viewed in reflected light. These indentations, which are slight, have a polished rather than a ground surface, but the general effect is a slight dulling of the surface. Poor polish is usually caused by improper grinding.

Stones—Any opaque or partially melted particle of rock, clay or batch ingredient imbedded in the glass.

Fire Cracks—Small cracks penetrating the surface of the sheet. Usually in the shape of short-hooked crescents. Caused by sudden heating or chilling of the surface.

Sand Holes—Rough spots on the polished surface produced during coarse grinding which fine grinding did not later remove; due, to some extent, to coarse grains of grinding sand becoming mixed with finer grades.

Central Area of Sheet—This term is used with slightly different interpretation with reference to plate or window glass. In plate glass the central area is considered to form an oval or circle centered on the sheet whose axes or diameters do not exceed 80% of the over-all dimension. This allows a fairly large area at the corners, which may have imperfections not allowed in the central area.

Products

VISTA PLATE ($\frac{1}{8}$ -in. Polished Plate Glass).

TAPESTRY GLASS.

For Pennvernon Window Glass, Helioglass (an

Ultra-violet Ray Window Glass), Carrara (Structural Glass), Copper Back Mirrors, standard Mirrors and standard weight Plate Glass, Store Fronts, Paints and Varnish, see Manufacturers' Index.

Vista Plate, the One-eighth Inch Polished Plate Glass

It has long been realized that the public would be more generally able to enjoy the benefits of plate glass if this product were manufactured commercially in the same thickness as ordinary window glass. For many years, the thinnest plate on the market was $\frac{3}{16}$ in. in thickness, and any buildings glazed with plate glass required sash larger than the standard $1\frac{3}{8}$ in., together with heavier window weights, to provide for the additional thickness and weight of plate glass over window glass.

Vista Plate is a true polished plate glass of the same thickness as double strength window glass, namely one-eighth of an inch in thickness. Vista Plate immediately eliminates the largest obstacle confronting architects when wishing to specify plate glass, for it allows the use of standard $1\frac{3}{8}$ -in. sash and ordinary window weights. Now the perfect vision, the polished surface and perfect reflection of plate glass may be had at only a slightly higher cost than ordinary window glass.

Equal in Quality to the Heavier Product—After experimenting for a number of years, and spending millions of dollars in plant equipment, the PITTSBURGH PLATE GLASS COMPANY developed a method for producing a true polished plate glass only $\frac{1}{8}$ in. in thickness, at a cost approximating that of the $\frac{1}{4}$ -in. product. The appropriate name of "Vista Plate" was given to this product. The quality of Vista Plate is equal in every respect to that of heavier plate glass, having two perfectly plane surfaces, highly polished, and free from waves and other defects present in common window glass. With the exception of weight, the same arguments can be advanced for the use of the $\frac{1}{8}$ -in. product as for the regular thickness, including true and perfect vision as contrasted with the distortion caused by sheet glass.

Vista Label
Appears on every light of genuine Vista Plate

A Boon to Builders—The use of Vista Plate in modern homes, schools, apartments, hotels, hospitals and office buildings, in fact, in all places where the openings are not of extreme dimensions, is not only very desirable, but almost essential if the exterior appearance and comfort of the tenants is taken into consideration. It is hardly consistent to specify with care and precision, various other building materials, and at the same time to permit the use of a glass which does not give the maximum of efficiency and beauty. The difference between the cost of glazing a building with Vista Plate and that of glazing it with common window glass is surprisingly small, the extra charges incidental to the use of plate having, as shown above, now been eliminated. All of the company's warehouses are prepared to submit alternate figures on any operations on which ordinary window glass is specified.

Slight Additional Cost Over Window Glass—Unless comparative bids are taken on Vista Plate against common window glass, the small additional cost of plate glass beauty cannot be realized. Plate glass immediately puts a building on a plane by itself for its superiority is so apparent. First appearances have great influence on prospective tenants and their natural reaction to a building glazed with Vista Plate is such as to justify its use. Plate glass beauty is appreciated and can be had at a nominal cost. Samples and further information will be furnished promptly upon request.

Facts to Remember About Vista Plate Glass—

Thickness: $\frac{1}{8}$ in. (glazed in standard $1\frac{3}{8}$ -in. sash).

Weight: 26 oz. per sq. ft.

Sizes: up to 68x130 in.

Quality: true, lustrous surface, equal in every respect to $\frac{1}{4}$ or $\frac{3}{16}$ -in. product, thickness excepted.

Source: full stocks carried at sixty-two distributing warehouses. (See above list.)

Tapestry Glass, a New Art Material

Tapestry Glass is unique. There is no other type of glass with the same qualities or advantages. To the building professions and trades, it opens up new possibilities for decorative and utilitarian treatment with glass. By a quirk of chance the new method of making plate glass revealed the art of making Tapestry Glass. Its beauty of texture and finish, the many

ways in which it can be treated decoratively, and the advantages of its use in place of plate glass or plain window glass, are so many, that Tapestry Glass almost immediately created a sensation among architects, owners, and building contractors.

Two Qualities, Plain and Polished—Tapestry Glass is furnished in two types, plain and polished. The natural surface

of Tapestry Glass is not ground and polished as in plate glass, but has a silvery, satinlike finish and a depth that, together with the ease with which it can be decorated, merits the name of Tapestry Glass.

Plain Tapestry Glass has both surfaces in the natural finish and is the one most generally used.

Polished Tapestry Glass has one surface in the natural finish and one surface polished. This is desirable when Tapestry Glass is used together with plate glass so as to present a uniform outward appearance, and also in hall doors and windows where obscurity is needed together with polished plate beauty of reflection.

Both types of Tapestry Glass have the same degree of light diffusion and obscurity and can be ornamented equally well. They give much greater light diffusion than ordinary factory ribbed, sheet prism, or other kinds of obscure glass. At a distance of a few feet, Tapestry Glass shuts out the view, yet objects placed close to its further surface are clearly discernible. Its depth and finish, unlike plate glass, obstruct and obscure vision, while admitting the maximum amount of light in a softly diffused manner.

Tapestry Glass can be had in innumerable designs: sandblasted, chipped, or mitered on the plain surface of the glass. Rich and very beautiful colored designs are easily achieved by a special method of artistic painting developed in our laboratories.

Varied Uses—Tapestry Glass has an almost unlimited field of uses, and new uses for it are being discovered almost daily. The following are a few of the many places where Tapestry Glass can be used to good advantage:

(1) For office doors and partitions. Tapestry Glass obscures the view yet lets in all the light, diffusing the rays softly and pleasingly, in a manner restful to the eye.

(2) For store transoms, side lights, etc., Tapestry Glass is preferable to tile prism, sheet prism, and other obscure glass.

(3) In steel sash for factory buildings where maximum light is needed but cleaning costs must be kept to a minimum.

(4) For ceiling lights, corridor partitions, and doors in public buildings, offices, hotels, institutions, and apartments. Tapestry Glass provides the desired privacy without losing any of the light.

(5) In the home, for bathroom windows, hall windows, front doors, and sidelights, bookcase and cupboard doors, etc.

(6) In churches, fraternal buildings, etc., Tapestry Glass, particularly when plain or colored designs are used, is ideal.

Very rich and beautiful effects can be achieved at a fraction of the cost of stained glass.

(7) In advertising signs on windows, doors, shop fronts, etc., the wording or design left clear and the background etched, or in the reverse treatment; color effects are particularly good for this work, and illumination from within adds to the power of the display. Tapestry Glass, colored or plain, is also used for electric display signs.

Summary of Advantages—(1) *Economic Value*—Tapestry Glass provides a service and satisfaction far greater than its slight additional cost over ordinary glass.

(2) *Individuality*—Tapestry Glass is different. There is no real substitute for it, either in its plain form or in the many ornamental effects which can be obtained.

(3) *Light Diffusion*—A tiny fraction of an inch below the surface, Tapestry Glass is perfectly clear, with all the excellence of fine plate glass. Through its satinlike, silvery surface, a brilliant flood of light is softly diffused, yet at a distance of a few feet, Tapestry Glass has all the advantages of opaque glass.

(4) *Durability and Strength*—Equal to plate glass of corresponding thickness.

(5) *Economy in Maintenance*—Tapestry Glass has no projecting pattern to catch and retain dust and dirt. Its unpolished surface does not show finger prints and other soiling marks. It is exceptionally easy to clean.

Sizes—Tapestry Glass is furnished in two thicknesses: $\frac{3}{8}$ and $\frac{1}{2}$ in., and in sizes up to 70x150 in.; and with same edge work as on polished plate glass—i.e., beveled, ground, and polished.

Decoration—Tapestry Glass can be sandblasted over the entire surface (effecting a soft, beautiful white light), with clear line borders, to include lettering, geometric designs, etc.

It can be single or double process chipped over the entire surface or to a sandblasted line in the design; or mitered satin finish for use instead of leaded art glass.

It can also be mitered in panels, squares, or special designs, in plain, sandblasted, or chipped surfaces.

Color effects can be used with any of these treatments.

Samples, Information, etc.—Samples and full information as to the many uses of Tapestry Glass (manufactured and sold exclusively by the PITTSBURGH PLATE GLASS COMPANY) will be furnished upon request, by any of our warehouses. Send for new booklet showing the extraordinary possibilities of this unusual glass.

Plain Tapestry Glass

Plain Tapestry Glass has a silvery, satinlike quality with a depth somewhat like old tapestries. Admits all the light but is opaque to vision a few feet away. Tapestry Glass does not reflect glare or images, but diffuses light softly.

Border Design Tapestry Glass

Plain Tapestry Glass with sandblasted border design in lower half; upper half has background sandblasted and plain border design. Similar effects can be had by single or double chipping or mitering. Many prefer it to leaded glass windows.

Geometric Art Patterns on Tapestry Glass

Upper half has background sandblasted; lower half is reverse treatment. The variety of designs and effects is almost limitless. Names of firms, etc., can be treated similarly.

Color in Geometric Art Designs on Tapestry Glass

Used either plain or in any of the many chipped, sandblasted, or mitered effects, this treatment assures a rich and beautiful result. Either background or designs can be colored, as the sample indicates.

SEMON BACHE & COMPANY

"Dependable Glass Products Since 1847"

Greenwich and Morton Streets, NEW YORK, N. Y.

Products

MIRRORS: "EVALAST"—permanently bright; Silvered, Gold, Gunmetal, Colored, Ornamented.

PLATE GLASS: Clear and Colored.

"SUNLIT" ULTRA VIOLET HEALTH GLASS.

"MALTESE" X-RAY LEAD GLASS.

Service

In addition to our domestic production, we are in collaboration with European producers of technical, art and structural glasses.

Submit your glass problems to us. We place at your disposal over 80 years' experience and the glass resources of both continents.

Plate Glass

We carry in stock high grade imported plate glass in all sizes, qualities and thicknesses.

Mirrors

French Plate Mirrors—For over 80 years we have specialized in mirror manufacture. Our mirrors are made of high quality French plate glass, polished to brilliant finish and processed with double coat silvering. These mirrors are produced in all sizes and thicknesses, finished in silver, gold or gunmetal, or in combination of these finishes—plain beveled, etched, V-cut, or otherwise ornamented.

"Evalast" Mirrors—Permanently brilliant reflection, not affected by moisture.

No discoloring—No clouding—No streaking.

Made by our exclusive process, resulting in permanent brilliance of reflection. Guaranteed to withstand climatic and atmospheric moisture and even direct contact with water.

GUARANTEED
EVALAST
Registered Trade-Mark
MIRRORS
SILVER WILL NOT SPOIL

The use of "Evalast" mirrors avoids the unsightliness of dull, discolored, streaked plates and the annoyance of dismantling, resilvering and reinstalling, the expense of which in most instances is greater than the original cost of installation.

"Evalast" mirrors are particularly adapted for seashore hotels and residences, bathrooms, lavatories, washrooms, beauty parlors, barber shops, store fixtures and wherever intermittent condensation ordinarily ruins standard mirrors. Invaluable in damp tropical climates and for marine work.

Made in all sizes from smallest bathroom mirror to largest sizes required for store fixtures. Moderate in cost—comparable with ordinary non-permanent mirrors. Samples and detail information on request.

Colored Plate Glass and Colored Plate Glass Mirrors

The growth of contemporary art brings with it a demand for color in art and decoration. Our line comprises the following colors in plate glass and plate glass mirrors:

Chrome green	Amethyst	Violet
Amber	Signal green	Light green
Light blue	Chartreuse green	Blue
Olive green	Neutralite (smoke gray)	Rose

Samples and information regarding any of our products furnished on request

"Sunlit" Ultra Violet Health Glass

A superior ultra violet ray transmission medium, thoroughly tested by technical and scientific laboratories both in the United States and Europe.

Medical authorities and scientists generally have endorsed this new type glass which permits passage into the interior of buildings of the health building ultra violet rays excluded by ordinary window glass.

The health value of ultra violet ray glass for hospitals, schools and other installations, houses, factories, offices, etc., has been widely recognized.

Permanence—The essential features of an ultra violet glass is permanence of transmission. As such glass is intended for years of service a high degree of efficiency during only the comparatively short duration of the solarization period is of little value.

U. S. Bureau of Standards tests accord "Sunlit" Ultra Violet Glass transmission efficiency, after solarization, at 302 m.u. averaging:

52.75%

(U. S. Bureau of Standards Report 62010, dated Sept. 4, 1930)

This is a higher after solarization efficiency than the Bureau of Standards rates any other glass commercially on the market.

The American Medical Association has issued a statement as follows:

"It is true that the biological value of an ultra violet transmitting glass is in exact proportion to its efficiency in transmitting the ultra violet rays that have biological value."

This indicates conclusively that glass of the highest transmission in ray lengths of greatest biological value, i.e., 290 to 310 m.u., is the most effective in actual use.

Price—Despite the superiority shown by the above, "Sunlit" glass sells at prices competitive with glasses of inferior transmission.

Identification—Each light bears our label and is etched with the trade-name "Sunlit."

VARIETIES OF "SUNLIT" HEALTH GLASS

Type	Thickness		Av. wt. per sq. ft., oz.	Max. size. in.
	Milli-meters	Approx. in.		
Clear sheet (window) glass . . .	1.8 to 2.5	$\frac{5}{16}$	18	42 x 54
Clear sheet (window) glass . . .	2.5 to 3.2	$\frac{1}{8}$	24	38 x 54
Clear sheet (window) glass . . .	3.5 to 4.2	$\frac{5}{32}$	32	36 x 45
Plate glass (clear vision)	2.5 to 3	$\frac{1}{8}$	24	25 x 50
Plate glass (clear vision)	4 to 6	$\frac{1}{16}$ - $\frac{1}{4}$	36	25 x 50
Wired glass (clear polished or rough wired)	6 to 8	$\frac{1}{4}$	50	
Cathedral glass (rough-translucent)	3.5 to 4.5	$\frac{3}{16}$	32	32 x 52

"Maltese" X-Ray Lead Glass

For protection screens in X-ray rooms. Highest lead content of any glass commercially on the market. Approved by American Medical Association.

Clear vision—high quality. Indispensable for hospitals, X-ray apparatus, windows and doors in X-ray rooms, screens, etc.

Is standard brand used all over the world for maximum protection against X-rays. Coefficient of protection is 0.28 to 0.29.

NATHAN LYONS, INC.

Fabricators of Mirrors and Decorative Glass

508-514 West 34th Street, NEW YORK, N. Y.

Products

SILVER, GOLD and GUNMETAL (LYCO) MIRRORS.
COLORED GLASS in all thicknesses.
PLATE GLASS.

Scope of Work

We are skilled artisans in every use and treatment of glass. In keeping with the modern architectural trend, our craftsmen are creators of beautiful effects, whether in the field of mirrors, colored structural glass or of etching and engraving.

The scope of work often includes contact with the architect in the creation of new decorative ideas as well as the careful carrying out of the original plans. The work then proceeds to the fabrication of the glass required and the actual installing, even to applying the necessary studding for permanent attachment to walls.

Mirrors

Quality mirrors are made for clubs, hotels, bathrooms, powder rooms, ballrooms, fine residences, department stores, etc.

The modern use of mirrors gravitates more and more to futuristic designs with two or three color schemes on one mirror. The various colors used beside the silver (a deposit of silver nitrate) are: *gold*—a deposit of gold chloride; "*Lyco*" (patented) *gunmetal color*—a deposit of lead; and *dark*—a dull silvered mirror. These different deposits of metal can be used on one mirror in different fields to show beautiful decorative effects in conjunction with various etching on the glass.

With colored mirrors splendid effects are obtained for interiors, valences, walls, and for caps of columns and pilasters, special border lines around silvered mirrors and other decorative purposes.

The "*Lyco*" gunmetal mirror reflects about 35% of daylight. In contrast to the ordinary silvered mirror there is absolutely no glare and it will give a perfect and true reflection.

Dusky mirrors adapt themselves ideally for decorative effects on walls and ceilings, reflecting with a satin, silver finish.

Permanence—Where there are damp walls, weather conditions or other factors which are apt to be detrimental, we recommend the addition of our special tar back to the mirrors. This new process, tar back, guarantees absolute permanence and protection against dampness.

"Marblelike" Colored Glass

"Marblelike" is widely and advantageously used as a substitute for marble. It is a non-transparent plate glass used for interiors and exteriors, walls,

columns, decorative panels, etc., and for counter and table tops, window sills, toilet partitions, urinals, etc.

"Marblelike" can be obtained in the following forms:

- (1) With one side polished and one side rough.
- (2) With one side polished and one side smooth.
- (3) With one side smooth and one side rough.
- (4) With both sides smooth.
- (5) With both sides polished.

Since "Marblelike" can be obtained with two sides polished it is ideal for such purposes as toilet partitions. It is no longer necessary to buy two pieces of material in order to have both sides of the partition polished. The risks of breakage are greatly reduced because the usual eight holes do not have to be drilled, nor the two pieces plastered together.

Objects appear straight when reflected on a wall paneled with "Marblelike," which is a ground and polished glass. Unlike other glass with wavy surfaces it can be used in unusually large pieces.

For artistic work in interior decoration the polished surface is often carved—the engravings having harmonizing colors of gold, silver, etc. Fireplaces can be built with

"Marblelike" glass in any color, decorated in the most exquisite fashion. Such carving, easily obtainable on glass, is much more permanent than marble which deteriorates with the carbonic acid in the air near a fire.

Hole drilling, edge grinding, polishing, etc., is just as easy with "Marblelike" as with marble and setting is equally easy. It can be set with plastic cement directly on the wall, or mounted with metal bars screwed on the walls.

Colors and Thicknesses—It is made in nineteen different colors:

Black	Medium green	Light mauve
White	Dark green	Dark blue
Light red	Onyx green	Light cream
Medium red	Light blue	Medium cream
Dark red	Dark mauve	Dark cream
Ivory	Medium mauve	Pearl gray
Light green		

Black and white are manufactured in thicknesses of from $\frac{1}{4}$ to $1\frac{1}{4}$ in. Other colors from $\frac{1}{4}$ to $\frac{3}{8}$ in. However, for special work, colored glass up to $1\frac{1}{2}$ in. in thickness can be obtained. Furnished in any size or shape up to 100 sq. ft. and in bent plates.

Plate Glass

We specialize in all branches of cabinet and high class interior glazing. Plate, window and roof glass are installed for entire buildings. Interior and exterior glass for banks is fabricated for check desk tops, coupon booth tops, counter screens, deal plates and black glass counter tops, shipped and set for any part of the United States. Felt and cement showcases and other types of showcases are manufactured to any specification.

The Lyons plant is fully equipped for all kinds of engraving, etching, embossing, sandblasting, mitre cutting, polishing and beveling of glass.

PITTSBURGH PLATE GLASS COMPANY

Copper Back Mirrors

PITTSBURGH, PA.

For Warehouses and Branch Offices, see our pages on Vista Plate Glass
For our Other Products, see Manufacturers' Index

Copper Back Mirrors Are Lifetime Mirrors

Mirrors are now obtainable, manufactured by the PITTSBURGH PLATE GLASS COMPANY, that are guaranteed by them for a lifetime against deterioration from climatic or atmospheric conditions and defective workmanship. These are copper back mirrors, and in case of deterioration they will be resilvered free of charge.

Pittsburgh Copper Back Mirrors will remain permanently as beautiful, as clear, and as efficient in reflecting properties as the day they were made. This has been made possible by protecting the silvering of ordinary mirrors with a coating of solid copper, thus making them absolutely moistureproof and airtight, something that is not possible with ordinary patent back mirrors.

Uses

Pittsburgh Copper Back Mirrors are recommended as permanent, decorative and practical installations for lobbies, interior doors and theatres, stores, barber shops, beauty parlors, etc., as well as for doors, furniture and wall mirrors in private residences. They are especially recommended for bathroom mirrors in private residences and hotels. The steam and sudden changes of temperature occurring in bathrooms, which ruin ordinary mirrors, leave copper back mirrors untouched.

Copper back mirrors are also particularly adapted for use in resort piers, and river, lake and ocean going vessels, where dampness and salt air are unusually destructive to ordinary silvered mirrors. Wherever an installation of lasting beauty is desired, Pittsburgh Copper Back Mirrors are advised.

Method of Manufacture

Pittsburgh Copper Back Mirror consists of a silvered sheet of polished plate glass as does any fine mirror. However, in addition, a layer of solid copper is deposited on the silver coating by an electrolytic process. This provides an impervious insulation, protecting the sensitive silvering against dampness and chemical reaction, and making the backing of the mirror more resistant against handling abuse. The delicate film of silver is perfectly protected by a sheathing of copper.

As a consequence, discoloring, cloudiness and de-

terioration are prevented and the original beauty and utility of the mirrors are maintained permanently.

Compare the magnified cross sections below of the copper back mirror with the old type of silvered mirror, and note the insulating metal between the porous coating of paint and the sensitive silver.

ORDINARY MIRROR

Magnified Cross Section
Showing silver protected only by a relatively soft porous coating of paint

COPPER BACK MIRROR

Magnified Cross Section
Showing solid copper strip between silver and paint

Specification

To insure obtaining mirrors which will be permanently of the highest quality, the following specification should be used:

Wherever marked on the drawings copper back mirrors, manufactured by the PITTSBURGH PLATE GLASS COMPANY, are to be furnished. Mirrors to be of best quality and to bear the manufacturer's label until approved and accepted by the architect.

General Information

Pittsburgh Copper Back Mirrors are now obtainable in any size up to 72x144 in.

The cost of these copper back mirrors is only slightly greater than that of the ordinary mirror. The difference is a small premium for insurance against future resilvering and reinstalling of these mirrors for the life of the building. They are real economy and should be insisted upon by both the architect and the builder.

Identification

Look for the label shown below, on all Pittsburgh Copper Back Mirrors. It is assurance that you are installing a mirror that will outlast the other fixtures.

NATIONAL LEAD COMPANY

Old Style Lead Cames, Templeads and Steelhearts

ATLANTIC BRANCH
NEW YORK, N. Y.

NORTHWESTERN WORKS
ST. PAUL, MINN.

For Hardlead Sheets, Gutters, etc., and Paint, see Manufacturers' Index

Old Style Lead Cames

Old Style Lead Cames, by their irregularity of outline and surface, bring an appearance of hand-wrought leading to windows of even the most simple design. In addition these comes make it possible to have a lead in harmony with the particular type of architecture employed. There are five designs from which to choose—Rustic, Rough Cast, Antique, Hammered and Frosted—as well as smooth finish comes with irregular edges.

Rustic

Rough Cast
(Patent No. 71132)

Antique

Hammered

Frosted

Smooth Surface—Irregular Edges

Furnished in following dimensions:

	Width of face, in.	Width of glass channel, in.
Rustic	$\frac{3}{8}$ to 1	$\frac{1}{8}$ and $\frac{3}{8}$
Rough Cast.....	$\frac{3}{8}$ to $\frac{3}{4}$	$\frac{1}{8}$ to $\frac{3}{8}$
Antique	$\frac{1}{4}$ to 1	$\frac{1}{8}$ and $\frac{3}{8}$
Hammered	$\frac{1}{4}$ to 1	$\frac{1}{8}$ to $\frac{3}{8}$
Frosted	$\frac{1}{4}$ to 1	$\frac{1}{8}$ to $\frac{3}{8}$
Smooth (irregular edges).....	$\frac{3}{8}$ to 1	$\frac{1}{8}$ to $\frac{3}{8}$

Templeads

These are Old Style Lead Cames made of tempered lead. Especially recommended for small windows where greater rigidity is required than soft lead gives and where steel reinforcement is either difficult or unnecessary. Supplied in all five designs illustrated above.

Reinforced Cames—All Old Style Cames, in face widths of $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, $\frac{1}{2}$, $\frac{3}{4}$ and 1 in., can be furnished reinforced with a tempered steel bar of such width as to give the greatest possible reinforcing strength.

Reinforced Cames

Steelheart Old Style Lead Cames

For very large windows, doors and skylights, where the ordinary steel reinforcement is not sufficient, our Steelhearts are available. These are something entirely new in leaded glass reinforcement and come not only in the Rough Cast, Hammered and Frosted designs, but also in smooth finish comes with irregular edges and in a smooth finish, straightedged came. Supplied in four widths: $\frac{1}{2}$, $\frac{3}{8}$, $\frac{3}{4}$ and 1 in. with glass channels ranging from $\frac{1}{8}$ to $\frac{3}{8}$ in. and with tempered steel bars varying in sizes from $\frac{3}{8} \times \frac{1}{8}$ to $\frac{3}{8} \times \frac{1}{4}$ in., buried in the came as shown below.

Standard
Steelheart
Section

STEELHEART
(TRADE MARK)

Colonial Steelheart
Section

Steelhearts may be used throughout, or the Steelhearts may be used for all or any part of the cross members, and lead of the same design, without reinforcement but with the same channel, may be used for the remainder of the work. In either case, saddle bars are eliminated while strength and rigidity are assured.

When Specifying

When specifying our Old Style designs, please mention the design by name, whether soft comes or templeads are desired, width of face, width of channel and whether reinforcement should be used.

When specifying our Steelhearts, please mention whether they should have Rough Cast, Hammered, Frosted design or smooth face, width of face and width of glass channel.

Suggested Specifications

Old Style Lead Cames shall be of the surface design [Rustic] [Rough Cast] [Antique] [Hammered] [Frosted] and width of face specified by the architect, and of NATIONAL LEAD COMPANY manufacture.

Where Old Style Smooth Cames are specified, they shall have the irregular edges, as in the comes manufactured by NATIONAL LEAD COMPANY.

Where it is necessary to reinforce the lead comes, the reinforcement shall consist of a tempered steel bar not less than $\frac{1}{8}$ in. thick, and of suitable width for each channel width, buried in the came by the manufacturer of the lead in the process of manufacture. Where steel reinforcement of $\frac{3}{8}$, $\frac{1}{2}$ in. or wider is specified, the Steelhearts manufactured by NATIONAL LEAD COMPANY shall be used. All Steelhearts and other reinforced comes, where shown or indicated, shall run through under both stops to the bottom of the rabbet, the other comes being fitted into the reinforced members.

The channel of the comes shall be sufficiently wide to receive the glass and to allow, in addition, ample room for enough putty to insure a perfectly watertight job.

The cement shall be made of high grade materials and be of such composition as will preclude the possibility of its becoming brittle with age. All cement shall be thoroughly worked into the channel, and the edges of the lead came pressed down firmly upon it.

Lead comes shall be soldered with high grade solder on both sides of the glass in such a way as to make a firm, rigid and workmanlike job. All soldered joints shall be so finished as to meet the approval of the architect.

Catalogue and Samples

Catalogue and samples sent to architects on request.

If you do not find exactly what you want mentioned on this page or in our catalogue, please write us, as we are continually making something new and different.

HENDERSON BROS.

Designers and Craftsmen in Leaded and Stained Glass

OFFICES AND STUDIOS

693 Third Avenue, NEW YORK, N. Y.

Henderson's Antique Leading

Adaptable to Early English and Tudor leaded glass. Henderson's Antique Leading is made to resemble the old hand wrought lead which was used during the best periods of old leaded glass. It gives a touch of distinction and individuality to leaded

glass that is both charming and characteristic of the best in old glass.

The comes are of widths varying from $\frac{1}{8}$ to 1 in., with or without center reinforcing.

Special designs of Period or modern glass executed for the architect.

Henderson's "Easy Fix" Metallic Leading

Revival of Georgian Period Leadings

The attention of the architects and builders is called to our "Easy Fix" Metallic Leading which makes possible the type of leading used during the Georgian Period, long since abandoned, but still to be seen in old doorways, ceilings, lights, etc.

By using modern materials, methods and our continuous clip (see drawings) which runs parallel and continuous with the glass and holds both glass and putty se-

curely in place, a leaded sash having the exact appearance of the old work can be economically furnished. The clip can be readily turned up to allow of inexpensive repairing by an ordinary mechanic and left in its original condition, making a substantial and weather-tight job.

"Easy Fix" Metallic Leading can be constructed of brass, copper, zinc or sheet metal and lead coated.

Lead ornaments of which we have a large assortment can be readily applied to Henderson's "Easy Fix" Metallic Leading.

RAVENNA MOSAICS, INC.

Glass and Enamel Mosaics—Marble and Slate Mosaic Floors

Architects Building, 101 Park Avenue
NEW YORK, N. Y.

Ravenna Mosaics

Studios here and abroad and connections with the best known mural painters and designers in America and Europe, enable this company to design and execute any mosaic work required by the architects.

Extensive study of the technique of the mosaics of the early Christian period, a staff of artisans—many of whom have been with this concern over thirty years; the execution of mosaics in different countries and styles and after designs of many artists are the basis on which Ravenna Mosaics has been developed.

RAVENNA MOSAICS, INC. manufactures all its own enamels. This material has been successfully used in the restoration of many of the Early Italian mosaics.

Specifications for Glass and Enamel Mosaics

Materials—The mosaic tesserae used shall be the so-called Venetian Mosaic Glass (Ravenna Mosaic Glass) known as smalti or enamel mosaics, of solid color, water and acid proof, and broken by hand with hammer and chisel, the fractured surface of the tesserae to form the surface of the finished mosaic unless otherwise provided for. The gold and silver mosaic material shall have the metal leaf fused in between two layers of glass.

Craftsmanship—All work shall be executed in strict accordance with the approved designs and samples.

The technique of the mosaics shall be of the same quality as that used in the early Ravenna and Roman Mosaics (examples at the Metropolitan Museum of Art).

Ample space shall be left between the single tesserae to allow the cement mortar to hold the mosaic cubes in place and all tesserae, especially the gold and silver, shall be tilted at different angles to give the

surface an uneven and interesting texture and sparkle.

Delivery and Installation—The mosaics shall be delivered at the building set on paper and shall be mounted on a scratch and float coat provided by the plasterer under the direction of this contractor, no gypsum to be used in mortar. The structural base for the mosaics may be either metal lath, concrete or brick work, as provided for in another section of the general specifications. Such sub-construction shall be brought to within 1/2 in.

Saint Bartholomew's Church, Park Avenue, New York, N. Y.

B. G. GOODHUE ASSOCIATES, Architects

HILDRETH MEIERE, Mural Painter

of the finished surface and finished to proper lines for a uniform bed to receive the mosaics. The mosaic contractor shall only furnish the final coat of cement mortar in which the mosaics are embedded.

Sufficient scaffolding for the erection of the mosaics, water, heat and light, shall be provided to the mosaic contractor.

Experience and Service

We place at the disposal of architects the knowledge gained in 41 years of building stained and leaded glass windows and glass mosaics for every known type of architecture. Combined with this is our unusual staff of brilliant artists and skilled craftsmen available to offer suggestions and execute your requirements in an artistic manner.

Special water color sketches and details of setting with suggestions and estimates will be sent upon request.

Suggested Specifications

General—All leaded glass shall be executed to conform with patterns shown on drawings or special design submitted and approved by architect.

(The width of lead, plain, irregular or antique and the type of glass, imported or domestic antique, cathedral or opalescent should be specified.)

Leading shall be soldered thoroughly on both sides and all flanges filled with a cement containing 50% pure white lead putty, 30% whitening, 10% litharge and 10% red lead mixed with pure linseed oil so as to make glass perfectly watertight.

Reinforcing and Setting—For setting in wood sash, use a pure white lead putty after sash has been primed, for bedding and beading.

Reinforcing to be formed of galvanized steel bars inside the leads, or, soldered to face of lead as determined by the width and design of the lights. The maximum width for inside reinforcement to be 24 in.

For steel sash setting, use an approved steel sash putty. Reinforcing as noted above to apply here also.

(Sash should be furnished with mouldings for most substantial construction.)

Where glass is set in stone reglet, it shall be leaded thoroughly in cement with a margin of lead showing evenly around edge of opening. It shall be reinforced by means of galvanized iron bars sunk deeply into the stone groove and tied to glass with a sufficient number of copper wires.

State if general scaffolding may be used, if cost of cleaning glass and repairs should be added to estimate.

 55 West 42nd Street, NEW YORK, N. Y.

SOLD BY LEADING GLASS DEALERS EVERYWHERE

Product

"MAGNALITE" a New Process Obscuring-Diffusing Glass manufactured by the Mississippi Glass Co. Types A, A Wired and B.

For our pages on Skylights, Transoms, Ventilators, and Roofing, see Manufacturers' Index.

Electric light spots are eliminated.

For Skylights—Magnalite will reduce interior glare and illuminate a larger floor area. The underside corrugations serve as condensation leads.

For New Art Constructions—The design of Magnalite lends itself well to this type of construction in store fronts and interior decorations.

Description

Magnalite is a clear sheet glass with both surfaces smooth and crossed by scientifically designed cylindrical lenses at right angles to each other on either surface. Type A Magnalite is manufactured with lenses approximately $\frac{1}{2}$ in. on centers and Type B $\frac{1}{4}$ in.

Purpose

Magnalite is the result of scientific experiments to produce a glass to accomplish four definite results:

(1) Containing no pockets in which dirt can collect, Magnalite is very *easily cleaned*.

(2) The cylindrical lenses on either surface at right angles to each other make it *obscure* in the true sense of the word.

(3) The scientific construction of the lenses produces uniform *diffusion* of light.

(4) The lenses are designed to minimize back refraction of light to allow the *maximum* of light *transmission*.

New Process Quality

The scientific transverse lens design of this glass together with the fire polished surfaces gives to it a brilliancy unequalled by almost any other type of glass. It is obscure but at the same time rates high in light transmission with a maximum diffusion and consequently a minimum of glare. Both types of Magnalite in plain sheets are manufactured by a *new continuous process* which produces perfect cylindrical lenses and a finish on both sides of brilliant lustre.

Adaptability

For Partitions—Magnalite is so obscure that absolute privacy is assured.

For Windows—Magnalite will collect light at acute angles, diffuse sunlight to produce an even work light and redirect light to dark corners.

For Ceiling Lights—Magnalite forms a perfect screen and hides all steel and floodlight equipment, thoroughly diffusing the light from illuminating units as well as daylight.

Type A for

Ceiling lights
 Windows
 Partitions
 Skylights
 Auditoriums
 Art galleries
 Railroad terminals
 Hospitals
 New art store fronts
 Public buildings

Type B for

Partitions
 Windows
 Doors
 For general use as an
 obscuring glass
 Office buildings
 Schools and colleges
 Apartments and hotels
 Hospitals
 Residences

Reproduction of a Sheet of Magnalite—Type A

Magnalite Type A

This type is designed principally for use in large openings and in locations distant from vision. It has been used extensively in ceiling lights, large partitions and windows, to produce well lighted interiors.

Wired sheets of Type A are adaptable for skylights and locations where a wire glass is required.

**Magnalite Type A Wired****Magnalite Type B**

Type B is designed for general use, where a smaller design than Type A is more architecturally correct and in locations close to vision. It has all the meritorious properties of Magnalite design.

DIMENSIONS AND WEIGHTS OF "MAGNALITE" GLASS

Type	Approximate thickness, in.	Maximum size sheets, in.		Approximate weight per sq. ft., lb.
		Wide	Long	
A Plain Wired	$\frac{1}{4}$	58	132	2 $\frac{3}{4}$
	$\frac{3}{8}$	48	132	4 $\frac{1}{2}$
B Plain	$\frac{3}{8}$	58	132	2 $\frac{3}{4}$

Specifications

All partitions and doors, windows, ceiling lights and skylights where shown on plans shall be glazed with Magnalite glass (specify Type A or B or Type A wired)

**Reproduction of a Sheet of Magnalite—Type B**

as furnished by J. MERRILL RICHARDS, 119 West First Street, Boston, or AMERICAN 3 WAY-LUXFER PRISM COMPANY, Cicero, Ill., and New York, N. Y.

Distribution

Magnalite glass is handled by all leading glass dealers. If your local glass contractor is unable to supply your needs, write us.

Products and General Uses

Manufacturers of PLAIN and WIRED FIGURED ROLLED GLASS and POLISHED WIRE GLASS for partitions, doors, transoms, windows and skylights of industrial and commercial buildings.

Patterns

Diffusex, Luminex—the "Smooth" Glass, Velvex, Industrex and Transex are recently developed patterns manufactured exclusively by the BLUE RIDGE GLASS CORPORATION. They afford the architect new opportunities to express his own taste in attaining beauty and harmony by the use of glass of unexcelled quality and mechanical efficiency.

Hammered, Ribbed, Florex, Mazex, Pebblex and Sheet Prism are older patterns made under the Blue Ridge policy of a uniform standard of quality for all products.

Distinguishing Characteristics

As the volume of light transmitted by glass is in direct proportion to the purity of its composition, architects and illuminating engineers stress the importance of quality when specifying a particular brand of glass. They realize that surface patterns or ornamentations only direct or diffuse the light passing through the glass and that dirt diminishes the volume available for distribution. Furthermore, glass of high quality has more luster than glass made from inferior materials.

All Blue Ridge products from plain ribbed to polished wire are made under one standard formula and uniform melting condition. This gives each pattern a brilliant luster and an unusually high volume of light transmission. In general, diffusion is accomplished by means of small convex lenses and shallow patterns to reduce the collection of dirt to a minimum. By avoiding sharp corners and deep markings these new patterns can be cleaned without using a brush.

Wire Glass

Wire glass can be furnished in all patterns except Luminex—the "Smooth" Glass, Transex and Sheet Prism. As our Rough Wire is smooth on both surfaces it is used extensively in conjunction with plain Luminex—the "Smooth" Glass.

Our manufacturing process prevents the formation of bubbles around the wire and insures location of the wire mesh midway between the two surfaces of the glass. Listed by Underwriters' Laboratories, Inc., as Fire Retardant R-2129.

Where to Obtain Blue Ridge Products

Leading glass jobbers and glaziers throughout the United States carry Blue Ridge glass in stock or can order it for direct shipment from our factory, thus insuring prompt service at all times.

POLISHED WIRE GLASS

Thickness $\frac{1}{4}$ Inch

Architects who have objected to the usual disfigurement of polished wire glass by clusters of bubbles on the wire mesh will appreciate the superb quality of this Blue Ridge product.

The bright steel wire is completely free from grouped bubbles and discoloration. It is firmly embedded

in the genuine plate glass midway between the two brilliantly polished surfaces. The beauty of polished plate glass will not be sacrificed for fire protection if your specification reads, "All Polished Wire Glass to be free from bubble clusters on the wire, as manufactured by the BLUE RIDGE GLASS CORPORATION."

ROUGH WIRE GLASS

Thickness $\frac{1}{4}$ Inch—Maximum Width 48 Inches

There is no similar product on the market. Because of its partial transparency it is ideal for use in openings not requiring the unobstructed vision afforded by polished wire glass.

There is practically no pattern to diffuse the light

but the volume transmitted is high because the metal is of such good quality. Its smooth surfaces make it comparable with clear glass in cleanliness.

Especially recommended for windows and skylights of factories and other industrial buildings.

TRANSEX

Thickness $\frac{3}{8}$ Inch—Maximum Width 48 Inches

The superior glass for store front transoms. Transex is a solid sheet of glass made to resemble separate tiles set in metal. The $3\frac{1}{4}$ -inch squares are the Diffusex pattern and the $\frac{3}{8}$ -inch lines are plain, a combination of pleasing appearance and practical value.

It is weatherproof because there are no cemented joints to weaken under the vibration of wind and rain storms and the division lines are not elevated above

the Diffusex background. A firm and leakageproof contact is thus insured between sash and glass at all points.

There are no pits, grooves or sharp angles in the pattern. It will remain clean under extreme conditions and distribute light efficiently long after dirt collections have destroyed the effectiveness of ordinary tiled transoms.

DIFFUSEX

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch—Maximum Width 48 Inches

A new design of modest beauty and highest quality. Transmits a soft light uniformly by means of tiny lenses which do not collect dirt rapidly. The lenses are but slightly elevated and there are no angular lines to make cleaning difficult. A damp cloth will suffice. Primarily for interior partitions, doors and transoms, but equally effective

in any location where adequate light diffusion is desired.

Polished Diffusex

Thickness $\frac{3}{8}$ inch, maximum width 48 inches. An added touch of refinement is given to rolled Diffusex by grinding and polishing the smooth surface. Polished Diffusex is recommended for the most costly buildings.

VELVEX

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch—Maximum Width 48 Inches

This unique pattern, although extremely shallow, is so designed that the play of light rays through the glass creates an illusion of depth and the lustrous beauty of brocaded velvet. Plate glass quality insures adequate light transmission which will not be materially reduced by exposure in dusty areas. There are no grooves or crevices

to collect dirt and make cleaning difficult. Velvex gives a pleasing effect in office partitions, doors and transoms and it is equally suitable for skylights, factory walls and monitors. While it is sufficiently obscure for ordinary commercial buildings we do not recommend Velvex for installations requiring complete privacy.

PEBBLEX

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch—Maximum Width 48 Inches

A figured rolled glass of unusual brilliance and beauty. It is popular for office partitions because of its effective diffusion of light while insuring privacy. The pattern is comparatively shallow and dustproof.

Polished Pebblex

By grinding and polishing the smooth surface of rolled Pebblex, a beautiful ornamental polished plate glass is obtained.

LUMINEX—the "Smooth" Glass

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch—Maximum Width 48 Inches

Luminex—the "Smooth" glass—is especially recommended for industrial glazing when the cost of keeping glass clean is an important factor and only medium distribution of light is essential. It is almost transparent and as the pattern is of extremely fine texture it can be glazed and cleaned like clear glass.

Photometric measurements made by a nationally recognized laboratory in November, 1927, showed that a

greater volume of light passed through Luminex—the "Smooth" glass—than through a leading brand of clear glass of corresponding thickness. This mechanical efficiency has influenced numerous engineers and architects to specify it for windows, monitor skylights and partitions in industrial buildings. Store front transoms, furniture tops and storm shields for costly leaded windows are other popular uses.

INDUSTREX

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch—Maximum Width 48 Inches

A highly practical light diffusing glass for industrial buildings. The small lens-shaped figures are compactly arranged to provide uniform refraction and overcome glare. As the glass quality is identical in all Blue Ridge products the light volume available for distribution is assuredly high.

Since light rays travel in a direct line unless deflected from their course, a simple demonstration of diffusion can be made by examining Industrex with an unshaded electric lamp as the light source.

The spread of the deflected rays will be plainly evident.

HAMMERED

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch—Maximum Width 48 Inches

The advantage of maintaining one uniform quality, regardless of the purpose for which the product is intended, is readily apparent in Blue Ridge Hammered glass. It differs from all other patterns of the same name both in appearance and scope of usefulness.

The contiguous lenses forming the pattern distribute

the light passing through the glass and accentuate the luster of the metal. Consequently, this Hammered glass offers beauty and cleanliness in addition to mechanical efficiency.

It is used for general industrial glazing in either exterior or interior locations.

FLOREX

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch
Maximum Width 48 Inches

This pattern is popular for interior glazing because of its beauty and effective distribution of light. Its brilliance is largely due to the quality of the glass, as the imprinting is based on the Blue Ridge principle of avoiding sharp grooves and corners as far as possible.

MAZEX

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch
Maximum Width 48 Inches

Mazex is a favorite of many architects. Its brilliance lends beauty and dignity to building interiors and it distributes light remarkably well. The surface is thoroughly covered by the design which gives total obscurity.

RIBBED

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch
Maximum Width 48 Inches

Ribbed glass is for industrial glazing only. It diffuses light satisfactorily but when exposed in areas where dirt and grease are prevalent its cleanliness is rather difficult to maintain. Unless special conditions warrant its use we suggest Industrex, Luminex—the "Smooth" glass—or Hammered as preferable patterns for factory windows, skylights and partitions. The metal of Blue Ridge Ribbed Glass is of the same quality as the higher priced designs, thus insuring light transmission unsurpassed by any other ribbed glass made.

PRISM

Thicknesses $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ Inch
Maximum Width 48 Inches

Prism glass offers maximum efficiency in light diffusion. However, the deep pattern which achieves this result also sacrifices ease of cleaning to a considerable extent.

Where collection of dust is no objection, Prism will prove entirely satisfactory.

Store front transoms are the most popular use of prism but it deflects direct light rays so well that wherever it is necessary to throw light to the ceiling of a room prism is an efficient upper sash glass.

Patterns are scientifically designed to give proper diffusion and obscurity for the locations for which they are intended.

Quality raw materials, and modern manufacturing methods make Highland-Western Glass unexcelled in brilliance, clarity and light transmission values.

Some of the most popular patterns are illustrated herewith over headings indicating their usual uses. Samples of all patterns manufactured sent on request from our offices.

Uses

Industrial Buildings—Sidewall sash; monitors and skylights.

Commercial and Institutional Buildings—Partition, transom and door lights; elevator shafts; skylights and area-ways.

General—Any location requiring daylight with privacy, or where the direct rays of the sun must be diffused or re-directed.

Fire Protection

Fire protection is afforded by the use of Highland-Western Glass, which is tested in the laboratories of the National Board of Fire Underwriters and is officially listed by them as "Fire Retardant No. 295." Most of the patterns listed above can be furnished in Wire Glass.

Distribution

Large stocks carried by leading jobbers throughout the country, and our nation-wide chain of three modern plants assure a dependable supply of glass and prompt delivery on the job.

MANUFACTURERS GLASS COMPANY

Manufacturers of Pressed Lens Glass
A Diffusing Glass for Daylight Illumination
38 South Dearborn Street, CHICAGO, ILL.

NEW YORK OFFICE, 551 Fifth Avenue
SUPPLIED BY LEADING GLASS JOBBERS EVERYWHERE

Products

PRESSED LENSIB GLASS, with and without wire, for skylights and ceilings. **LENS SHEETS**, with and without wire. **PRESSED LENS**, Hexagonal and 4x4 Tiles for Schools and Partitions.

Pressed Lensrib Wire

Lensrib, with or without wire, especially adapted for glazing skylights, ceilings, side walls, etc., increases daylight illumination 50% or more and has perfect cleanability. Transmits the vertical light and gives a shadowless light without glare. No loss from reflected light.

The extraordinary volume of daylight illumination (shadowless light) is unusual and the glass may be used in all classrooms, laboratories and science buildings, even those more modest in design.

One of the advantages of high levels of illumination is the enhanced production attained from the greater ease, accuracy and safety with which the student or workman can perform his operations, whether laboratory, machine shop, printing plant or laundry.

It is quite possible to increase the daylight illumination from skylights, ceilings and other sash, 50 to 100 per cent as measured in foot candles by using the Lensrib pattern. A shadowless light even is possible by the use of sufficient glass area. Such calculations are based upon the following factors from 1 to 10, inclusive.

1. No loss from reflected light.
2. Gets the vertical light.
3. Highest possible transmission.
4. Maximum diffusion or re-directed light passing through.
5. No glare.
6. Self-cleaning surface, perfect cleanability.
7. Heat dispersion.
8. Fracture resistance.
9. Conceals the light spots from reflectors.
10. More light on dark days.

Hexagonal Tile

Same superficial area as 4x4 in. This clever new design gets away from straight lines, is unique and snappy, glazed in copper plated bars to fit any openings

Pressed Lens 4x4 Tile Frames to Fit Any Opening

Pressed Lensrib Wire Glass

*There Is No
Substitute
for Vision*

Pressed Lens Wire Glass

Specify $\frac{1}{8}$ -in. Pressed Lens Glass, plain and wired

Rates Highest Classification for: Light Transmission (95%); Redirected Light; Perfect Cleanability; Crystal White Color; Diffused Light; Attractive Appearance; Non-Corrosion; Moderate Cost.

We claim no other glass excels for so many uses:
Office partitions
Doors
Bank screens
College libraries' ceilings
Chemical laboratories
University centers
High school gymnasiums' ceilings
Hospitals
All skylights (everywhere)
Solariums (for sanitary reasons)
Art gallery ceilings
Assembly Hall ceilings
Transoms (over plate glass windows)

Perfect Light Distribution

Schools everywhere now deficient in natural daylight may be perfectly lighted by the use of Pressed Lens Glass in the exterior upper sash in about two-fifths the glass area. The U. S. Department of Health, Washington, Bulletin No. 159, reported on test of typical school study room "From the desks in the row farthest from the windows the illumination was below the accepted standard of 5-ft. candles much too frequently."

We can guarantee the use of Pressed Lens Glass in the exterior upper sash to increase the illumination at the desk height and above in the fourth row and beyond 100 per cent, probably more.

Interior office planning finds Pressed Lens Glass valuable for the effectual screening of divided rooms. In obtaining this high degree of obscurity we have not sacrificed the lighting possibilities. Pressed Lens Glass is more striking in appearance than ordinary kinds of figured glasses and serves all of the purposes of an ideal partition glass at a minimum cost. 70,000 ft. used on this job.

**Buhl Building, 29 Stories,
Detroit, Mich.**

Pressed Lensrib (Wire) Glass

A Diffusing (Wire) Glass for Skylights, Ceilings and Side Walls, Giving 50 to 100 per Cent Increased Light—Gets the Primary Light

For acceleration of physiological and process requirements everywhere:

Gymnasiums
Natoriums
Solariums
Hospitals
Utility Power
Printing
Machines
Laundries
Garage Plants

Especially designed for daylight illumination of:

Art Galleries
Museums
Biological
Chemical
Engineering
Photo-Chemical
Laboratories
Libraries
Auditoriums

Description—Underwriters' standard $\frac{1}{8}$ -in. wire glass, Lensrib surface formation consisting of circular lenses $\frac{1}{2}$ in. in diameter, 4 to the square inch, on one surface, overlapped on the opposite side by parallel lenticular ribs 22 to the inch. Should be glazed with lenses outside and ribs running vertically on the inside.

Characteristics—In this new product the illuminating engineer has linked together the angles of refraction in such fashion as to invent something very new in glass. Multiple refraction, also called diffusion, a spreading of the light flux without glare by which vision indoors more nearly approximates natural outdoor environment, has been achieved with such specific results that the increase in foot candles as read by a photometer may be 50% to 100%, and under some conditions 200% to 300%. A knowledge of physiological and process requirements proves that nerve wracking glares, sunspots, shadows and under-illumination generally, may be almost if not entirely cured by the use of a moderate area of Pressed Lensrib Glass.

Photometric Illumination Chart D-93 on this page, definitely and specifically charts the lines of multiple refraction as compared with other glass, and shows a spread of nearly 50° in redirected light, from which it is a simple calculation to predict in advance where dimensions are known, the necessary glass area and the location of openings, orientation, etc., necessary to correct most of the existing evils of defective daylight illumination.

Glass with a flat surface loses 50% or more light from reflection (see Higbee & Randall's Symposium on Illumination) while Pressed Lensrib takes the vertical light at any angle and redirects it widely by a process of multiple refraction.

Pressed Lensrib Wire Glass

Shows perfect waterproof glazing in most approved standard type puttyless construction. Details upon request

How to Specify—All skylights, sidewalls, ceilings, and other openings, are to be glazed with Lensrib Wire Glass as shown on plans and specifications, which product is made by the MANUFACTURERS GLASS COMPANY, First National Bank Building, Chicago, Ill.; this glass shall be glazed with lenses on the exterior and ribs underneath, so that any condensation may be drained by the rib channels.

Distribution of Light Through Pressed Lensrib Glass as Compared with Ordinary Ribbed Glass, etc.

Continuous lines show Pressed Lensrib Glass to have a 50° spread, or angle of light diffusion.

Dotted lines show ribbed glass typical of similar factory glass to have little value for diffused light.

Test No. 46329 by Electrical Testing Laboratories, New York, March 5th, 1928

PRESSED PRISM PLATE GLASS COMPANY

Manufacturers of Ornamental Polished Plate Glass Products

27 North Dearborn Street
CHICAGO

551 Fifth Avenue
NEW YORK

Products

"IMPERIAL" ORNAMENTAL PLATE GLASS in five styles; "IMPERIAL" PRISM-PLATE GLASS in large plates; "IMPERIAL" PRISM SKYLIGHT GLASS (unit plates 18x60 in.).

thickness, namely, $\frac{1}{4}$ to $\frac{5}{16}$ in. Maximum size of all patterns 72x84 in.

The plate prism glass for store front transoms and upper sashes of exterior windows is $\frac{3}{8}$ to $\frac{7}{8}$ in. thick. Maximum size of prism glass, 84 in. wide (horizontal dimension) by 72 in. high.

Distinguishing Characteristics

All the products illustrated are ground and polished plate glass with clean-cut prismatic figures die pressed on one side.

They may be readily distinguished from all other figured glasses by their uniformity of pattern and absence of disfiguring waves or roller marks on either smooth surface or figured surface.

They are strong, durable and easily cleaned. The patterns harmonize with any style of finish and a wide range of modern architecture.

Being polished plate glass they blend as no other figured glass can with the plain polished plate glass windows which characterize modern building elevations and interiors.

Quality and Dimensions

The products are made in one standard polished plate glass quality and the ornamental patterns, Style O-1, O-2, O-3, O-4 and O-5, in standard plate glass

Suggested Specifications

All sash doors, transoms and other openings in corridor partitions and all interior communicating sash doors and partition openings, shown or indicated as containing glass, from the to the floors, inclusive, except (Note 1), shall be glazed with "Imperial" Ornamental Plate Glass, Style (Note 2) as manufactured by PRESSED PRISM PLATE GLASS CO.

All exterior toilet room windows, the ceiling sash under skylights in the, casement doors and sash partitions on mezzanine and, and all other openings not otherwise mentioned which are shown or indicated as containing obscure glass or marked O-1, O-2, O-4, etc., shall be glazed with "Imperial" Ornamental Plate Glass of the style indicated, as manufactured by the PRESSED PRISM PLATE GLASS CO.

(Note 1) except (here may be mentioned fire exit doors, hose cabinet doors, elevator enclosures or other incidental openings which need to be of a clear plate glass or polished wire glass, etc.)

(Note 2) Style—(Insert here O-1, O-2, O-3, O-4 or O-5. Selection of a definite style prior to asking for bids minimizes the possibility of substitution or misunderstanding.)

MISSISSIPPI GLASS

A Standard for Every Architectural Daylighting Requirement

Products

PLAIN and POLISHED FIGURED GLASS, POLISHED WIRE GLASS, PORT LIGHTS, DECK, VAULT or FLOOR LIGHTS.

Mississippi Glass

The various patterns of Mississippi Figured Glass make it possible to choose styles that will be in keeping with the architecture of a building, as well as to obtain the maximum possible advantage from daylight illumination.

Brilliancy, strength, true cutting surface, uniformity of color and excellence of quality in Mississippi patterns combine with moderate cost to make Mississippi Glass the choice of thousands of architects, engineers and builders.

Mississippi Wire Glass

The MISSISSIPPI WIRE GLASS COMPANY is the original manufacturer of Solid Wire Glass, and its product is universally recognized as the standard wire glass, being the product upon which the Underwriters' standard was based in 1899.

By our process of manufacture, Standard Wire Glass is cast solid, and is superior in quality to any similar product on the market.

Wire Glass is rolled plate glass having a wire netting embedded equidistant from either surface. This process is automatically effected while the glass is in a molten state and, therefore, insures homogeneous and solid wire glass.

Adaptability of Wire Glass

The object of Wire Glass is to afford perfect and constant fire protection at a minimum cost, at the same time admitting and diffusing the light. It is particularly suitable for use in windows, doors, transoms, skylights, and all places where fire or breakage protection is required.

Advantages of Wire Glass

When employed as above mentioned, Wire Glass may be fractured by severe heat or sudden shock, but the wire mesh will hold the shattered pieces in place, preventing their falling and causing serious injury or loss of life. It will also prevent draft and hold a fire within the bounds of its origin.

Identification Label
on Mississippi Wire Glass

Underwriters' Requirements, Extract from Rules—1906

"(2) Size of Glass—(a) The unsupported surface of the glass allowed shall be governed by the severity of exposure and be determined in each case by the underwriters having jurisdiction, but in no case shall it be more than 48 in. in either dimension or exceed 720 sq. in. (b) The glass to be of such dimensions, after selvage is removed, that the bearing in the groove or rabbet is not to exceed $\frac{1}{8}$ in. less than the full depth called for in rules 7 and 8. (c) The glass to be retained by the structural part

of the frame or sash independently of the material which may be used for weatherproof purposes. Only non-inflammable material to be used in setting glass in the sash."

Ordering

Glass being one of the last materials to go into a building, it is often not ordered far enough ahead to give the manufacturer time to cut the glass to sizes and make shipment in time to enclose the building by the date desired. It is, therefore, advisable to give this point consideration in due time, as the tremendous demand for figured glass and figured wire glass necessitates orders taking their turn as they are received.

In ordering always specify width first. In wire glass, the twist of the wire runs with the length of the sheet. When giving sizes remember that the first dimension is understood to be the width.

How to Specify Wire Glass

Wire Glass shall be installed in (specify location) and in all places marked "W.G." on plans and elevations.

The Wire Glass to have a thickness of at least $\frac{1}{4}$ in. at thinnest point. Wire mesh to be not larger than $\frac{7}{8}$ in., and no wire used for such mesh to be smaller than No. 24 B&S gauge. Plane of the wire mesh to be practically midway between the two surfaces of the glass.

Selvage shall be removed from glass before framing.

(State here type or types of glass to be used and where.)

Wire Actual Size

Mississippi Polished Wire Glass

The Standard

In 1893 the Mississippi Company began the manufacture of wire glass. It was a rather crude-looking material in comparison with the present perfected product, but it served the purpose for which it was intended—a material which would permit light and vision and act as a fire retardant.

Many practical demonstrations soon convinced engineers, architects and the general public that it was possible to protect a building from fire by a material that would not keep the interior in utter darkness.

A circular sent out by the Mississippi Company on August 24, 1899, stated that "The Solid Wire Glass manufactured by the Mississippi Glass Company is the only make of Wire Glass which has been officially approved, after tests, by the Boards of Fire Insurance Underwriters of the principal cities of the

United States, and acceptable for its superior manufacture and fire retardant quality, subject to their rules."

The present Underwriters' Laboratories, organized in 1901, following the earlier approval of underwriters throughout the United States, recognized the solid wire glass manufactured by the Mississippi Company as the Standard, and gave it the title of "FIRE RETARDANT No. 32."

Naturally, processes of manufacture have been vastly improved, and are constantly being improved by the Company's engineers. Mississippi Wire Glass is cast solid and is made from specially refined glass metal. It has received universal recognition because of its superior quality and finish. Mississippi Polished Wire Glass is sold by glass distributors everywhere. See table of sizes and thicknesses on page 12.

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

Pattern Actual Size

FACTROLITE GLASS

Scientifically designed to obtain maximum daylight illumination in modern factories.

This pattern is the product of extensive research by Mississippi Engineers in the efficient use of daylight in modern factories, and is the last word in the scientific daylighting of such buildings. It will give the most uniform distribution of light in all directions that it is possible to obtain, and will increase the illumination in a building from 38% to 72% as compared with plain glass.

Factrolite is manufactured in three thicknesses in plain glass and in two thicknesses in wire glass. See table of sizes and thicknesses on page 12.

Factrolite as an Aid to Industry

This pattern has been scientifically designed to accomplish definite results.

(1) The elimination of glare so far as possible by the complete breaking up of the direct rays of the sun and the uniform diffusion of sunlight so that strong contrasts are eliminated and the illumination is softened, thus approaching that of north sky light.

Illumination in a room twenty-five feet or more deep may be increased from 38% to 72% by using Factrolite instead of plain glass. The improved illumination through Factrolite materially relieves eye fatigue and automatically increases quantity and quality of production.

(2) Factrolite may be easily cleaned as all depressed surfaces are straight lines and there are no

pockets in which dirt becomes embedded so that it can not be dislodged with a stiff brush.

Factrolite has been used in hundreds of the most efficient industrial plants in America, including such famous names in industry as Western Electric Company, Ford Motor Company, New York Edison Company, Dunlop Tire & Rubber Co., Pacific Mills, American Thread Co., Jenkins Bros., Inc., and the United States Government.

The list of satisfied users is constantly growing because no factory can be considered truly efficient that does not make the proper use of daylight—and no product equals Factrolite for efficient daylight illumination.

(See Chart page 10 and Graph page 11.)

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

*Pattern Actual Size*

Aurora Glass

The ideal glass for partitions. The pattern is cut at an angle which gives the highest transmission of light, and at the same time deflects it to where it is wanted. It combines high quality, pleasant appearance and efficient light distribution.

AURORA is manufactured in two qualities, plain and polished. See table of sizes and thicknesses on page 12.

Specify
"Mississippi"

Ribbed Glass

A ribbed glass supreme in the quality of its material and in its cutting surface. It is a simple design which affords excellent light diffusion and is extensively used for skylights and windows in factories, power plants, and other industrial buildings.

This pattern is also manufactured in Wire Glass.

Leading distributors everywhere can supply this and other Mississippi products. Samples gladly sent upon request.

*Pattern Actual Size*

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

*Pattern Actual Size*

Pentecor Glass

A glass specially made for use in skylights, with ribs cut at an angle to collect and transmit the maximum amount of light without loss from total reflection. The light is deflected at right angles to the ribs, and will increase the light in a building, at a point fifty feet from the light source 130% as compared with plain glass. When installed in skylights set at the proper angle, Pentecor will conduct condensation and prevent dripping.

(See Chart page 10 and Graph page 11.)

Pentecor is also made in Wire Glass. See table of sizes and thicknesses on page 12.

Specify
"Mississippi"

Hammered Rough Glass

This is an example of superior Mississippi quality—the best plain Hammered Rough Glass that is produced.

It is most appropriate for use in skylights and industrial buildings where distribution of working light is not an important consideration. Its design and fine qualities also make it popular to harmonize with certain styles of architecture.

Hammered Rough Glass is also manufactured in Wire Glass.

Leading distributors everywhere can supply this and other Mississippi styles. Samples gladly sent upon request.

*Pattern Actual Size*

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

Pattern Actual Size

Syenite Glass

A figured glass which, because of its irregular pattern, is suitable for many styles of architecture. It obstructs the vision and provides ample diffusion of light.

Syenite is also made in polished glass, and in Wire Glass both plain and polished. Consult the tables on page 12 for the various styles and thicknesses of this effective pattern.

Specify
"Mississippi"

Ondoyant Glass

This is the oldest pattern of figured glass produced by Mississippi, and one that has retained its popularity since its introduction. It obstructs the vision while affording a liberal distribution of light. It is widely used for transom and ceiling lights, and is predominant in leaded work because of the pleasing light effects produced by its light-retaining, rippled surface corrugations. Its casual pattern harmonizes with nearly all decorations.

Ondoyant Glass and other Mississippi patterns are sold by leading distributors everywhere.

To make certain of obtaining the best quality be sure to specify "Mississippi."

Pattern Actual Size

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

*Pattern Actual Size*

Maze Glass

A figured glass with a brilliant pattern formed by a succession of prismatic figures filled with smaller prisms which, by nature of the angles at which they are cut, diffuse and distribute the light in all directions.

The Maze pattern is also manufactured in Wire Glass. See table of sizes and thicknesses on page 12.

Specify
"Mississippi"

Florentine Glass

This is one of the earliest styles of figured glass produced. It is still used in large quantities because of the efficient manner in which its attractive prismatic design diffuses light while obstructing the vision. Because of these qualities Florentine Glass is very effective for doors, transoms and partitions. Its rich design makes it adaptable for many styles of architecture.

Florentine Glass and other Mississippi patterns can be obtained from leading glass distributors everywhere. Samples will be gladly sent upon request.

To make certain of obtaining the best quality be sure to specify "Mississippi."

*Pattern Actual Size*

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

Pattern Actual Size

Hylite Glass

In Hylite, Mississippi presents an exceptional pattern which will be found most effective for a variety of uses where ordinary transparent glass is not quite desirable. Its pattern, composed of minute "etching point" depressions, obstructs vision sufficiently to permit a reasonable amount of privacy, although the glass appears to have perfect transparency at first sight.

Because of the character of its pattern, Hylite is

easier to clean than any other obscure or semi-obscure glass.

Hylite is also made in Wire Glass in two thicknesses. Consult the tables on page 12 for exact sizes.

Specify
"MISSISSIPPI"

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

Pattern Actual Size

Translite Glass

A translucent glass of exceptional quality especially made for transoms. Its pattern of broad, semi-transparent stripes crossing in $3\frac{1}{2}$ -in. squares makes this an unusually effective glass for transoms—a place where too often no thought is given to the decorative value of the glass.

Translite adds the finishing touch to a job well done. It is easily kept clean, and having excellent light distributing qualities, can be effectively used for win-

dows in halls, bathrooms, etc., where an effective design, good light and privacy are considerations.

To make certain of obtaining the best quality be sure to

Specify
“MISSISSIPPI”

For Full List of Sizes and Thicknesses of Mississippi Products See Page 12

Glass Designed Especially for Industrial Buildings

After extensive tests of the light transmission and distribution qualities of every available type of glass had been made, the Mississippi Glass Company developed two new types of glass to accomplish definite results—Factrolite for vertical sash and Pentecor for pitched skylights.

The following charts and graphs, together with condensed data, will doubtless be of service when determining the glass to specify for special purposes.

REPORT NO. 24558

DISTRIBUTION OF LIGHT TRANSMITTED THROUGH FACTROLITE—INCIDENT LIGHT ON ROUGH SIDE OF GLASS—RELATIVE LIGHT INTENSITIES

Test of Factrolite—The tests were made by measuring the distribution of light in two planes perpendicular with each other, with light from an incandescent lamp 3 ft. distant falling normally upon and passing through the glasses. The relative light intensities are recorded in per cent of the normal (0°—normal—equals 100%).

Angles	First plane		Plane perpendicular to first plane	
	Right	Left	Right	Left
0 (normal)	100%		100%	
2½	60.5	86.5	85.2	75.4
5	41.8	51.8	41.0	28.9
7½	24.0	30.6	15.8	13.8
10	9.88	13.3	1.33	9.14
15	1.43	4.45	.39	1.31
20	.101	.81

Chart Showing Efficiency in Light Transmission with Factrolite

Economy of Factrolite—Today, as never before, owners of industrial buildings are coming to realize the advantages of properly controlled daylight.

Whereas more heat is required to maintain a given temperature in a building with 80% of its wall area glass than is required for a wall area of 20% glass, this additional heat is required for only five months of the year, whereas with the 20% glass area, it is necessary to artificially light the building a large part of the time.

Factrolite breaks up the rays of the sun, diffusing the light and distributing it equally, so that glare is reduced to a minimum.

REPORT NO. 47571

LIGHT TRANSMISSION THROUGH NEW PENTECOR GLASS RENDERED TO THE MISSISSIPPI GLASS COMPANY ORDER NO. 42294-S

Distribution of light through the sample of sheet glass was made with the incident light falling normally upon rough side of glass. Measurements were made in plane at right angle to prism.

The light source used was a filament of small dimension, approximately 0.1x0.1 of an inch, and placed at a distance of three feet from the glass. Light distribution measurements were made by observations of the light through the glass. The observations were taken at different angles as noted on the graph.

The values of the light transmitted through the sample are in per cent of the maximum.

Transmission Factor

Light transmission measurements were made first with unidirectional light falling normally upon the surface of the glass and, second, with

diffused light falling upon the glass. In making the latter measurements, a hemisphere of uniform brightness was employed.

Results of Test

The distribution data are shown in Table No. 1 and on Plate No. 22310 reproduced below.

The light transmission values are shown on Table No. 2.

BRIEF OF REPORT NO. 28482

RENDERED TO THE MISSISSIPPI GLASS COMPANY

DISTRIBUTION OF ILLUMINATION THROUGH FIGURED SHEET GLASS WINDOWS IN A MODEL ROOM

ORDER NO. 16649-S

Object

An investigation to study the distribution of daylight illumination in a room with various types of $\frac{1}{4}$ -in. figured sheet glass used in the window.

Test Room

Model, representing a room 50x100x14 ft.

Scale, 1 ft. = 25 ft. (24x48x7 in.)

Windows—Continuous on one side of room 3 ft. high, sill 4 ft. from floor.

Ceiling and walls—White gloss finish (commercial factory paint).

Floor—Brown linoleum (having reflection factor of average factory floor).

Source of Light

Concentrated filament incandescent lamp, representing the sun at 30 degrees from horizon. The intensity of the sun was approximately proportioned to the size of the room.

Sky uniformly bright within $\pm 20\%$

Light within the room—direct sunlight, 80%; skylight, 20%.

Tests

Test Stations in five lines as shown.

Horizontal illumination on working plane—equivalent to 40 in. above floor.

Transmission of light through glass samples.

AVERAGE HORIZONTAL ILLUMINATION OF LINES OF TEST STATIONS

Distance from window in feet.....	Transmission, per cent of clear	Average horizontal illumination of lines of test stations

Mississippi Sales Policy

It has always been the policy of the MISSISSIPPI GLASS COMPANY to market its products only through glass distributors who always carry a large stock, assuring prompt delivery anywhere.

This policy has proven most beneficial to those who specify Mississippi, because the general contractor, owner or architect knows that he is assured of keen competition by inviting bids from reputable dealers.

Furthermore, by specifying a Mississippi pattern all dealers will figure on one and the same quality.

It is advisable to request your local glass distributors to quote you square foot prices on Mississippi products so that you can keep these comparative prices in your files with your copy of the latest Mississippi catalogue designed in accordance with the A.I.A. specification for filing. Should you not have this catalogue, one will be sent you upon request.

Desco
METAL
STORE FRONTS
REG. TRADE-MARK

"Desco" ventilated sash is of the continuous gutter type, is made of heavy gauge cold rolled metal and ample ventilation and drainage holes assure proper ventilation and drainage at all times and seasons of the year. Dust strips that function can be provided if required. The setting blocks

are of heavy copper channel, rocker type, fitted with soft lead cushions. Caps for corners, both horizontal, vertical and reverse are included. Hollow metal moulding of the same design and shape of face

plate of sash can be furnished when necessary.

"Desco" sill covers, jamb covers, transom bar covers, etc., are rolled from cold rolled metal in heavy gauges. The corners are sharp and clean cut, the designs pleasing and practical.

Head jamb covers, transom bar covers and sill covers are fitted with water drips to make them waterproof when installed.

Description

"Desco" Metal Store Front Construction has been designed to meet requirements of the most critical architects, the several shapes and members of the construction harmonizing perfectly along most approved architectural lines.

Heavy gauge cold rolled non-ferrous metals only are used in its manufacture.

Architects will find "Desco" complete in every detail, including everything necessary for the simplest or most elaborate store front job.

Simplicity

The simplicity of "Desco" is one of its strongest points. Each member is designed to function in the simplest, safest and most practical manner. No freak ideas are found in "Desco" and overdesigning has been systematically avoided. No special shaped or out-of-the-ordinary woodwork is required for its use, and ordinary mechanics install it quickly and correctly without trouble.

Corner bars, division bars and reverse corner bars are of the simple, strong, practical, easy-to-install type. The glass rabbets are extra deep and the flat surfaces of the wings hold glass firmly and safely. All steel reinforcing channels are rustproofed and copper plated.

Copp's Arcade, Vancouver, B. C.

An interesting "Desco" installation showing the added attractiveness which these high quality Store Fronts give to display windows

Finishes

"Desco" is made in solid copper, solid bronze or aluminum alloy in plain, polished, statuary bronze, gunmetal, oxidized copper and nickelplated finishes.

Special finishes can be supplied when desired. Samples furnished on request.

Distribution

Complete stocks of "Desco" are carried at the Detroit and New York warehouses, and by distributors in nearly every important city in the United States and Canada.

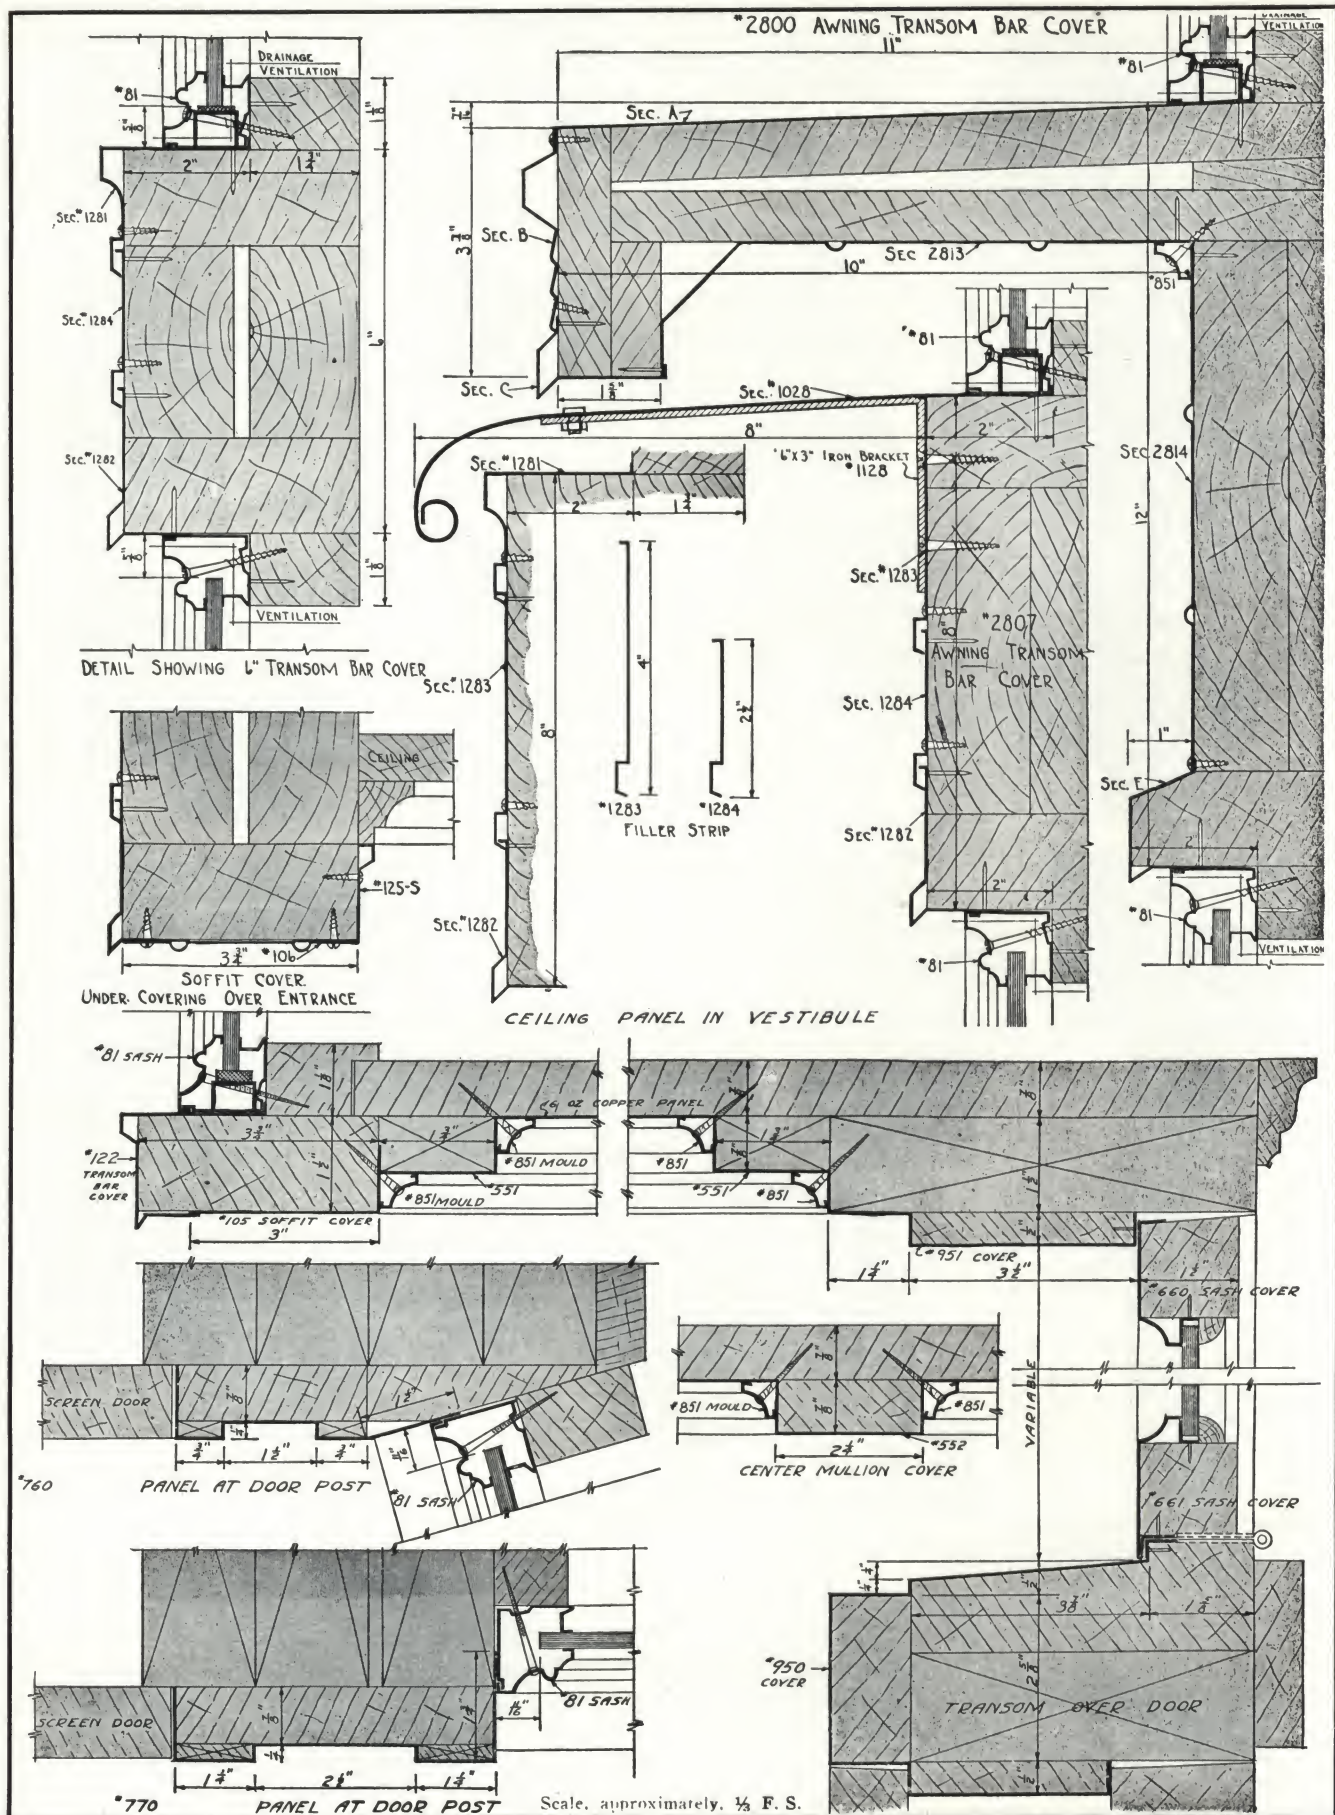

Architectural Service

Full size details and catalogue showing "Desco" in all its various combinations and uses will be mailed free to any architect on request.

AMERICAN 3 WAY-LUXFER PRISM CO.

1301-1305 South 55th Court
CICERO, ILL.
(Suburb of Chicago)

55 West 42nd Street
NEW YORK, N. Y.

PRODUCTS DISTRIBUTED THROUGH ALL LEADING GLASS JOBBERS

For our Sidewalk and Vault Lights, Daylight Roofing and Obscuring Glass, see Manufacturers' Index

3 Way-Luxfer Pressed Tile Designs

3 Way-Luxfer daylighting products are used for store front transoms, windows, skylights, interior doors, partitions and ceiling lights. They are made and assembled in a number of different designs illustrated on the following page. The diamond shaped tile in the Lux Lens design and the 6-in. square diffusing tile are new developments. All styles are made in the pressed tile and built in panels to fit the opening. In these panels ventilators either with or without screens can be built to provide any desired ventilating area. In addition, firm names or business in colored glass can be incorporated for advertising signs.

Specifications—All transom lights, interior partitions and ceiling lights shown on plans shall be glazed with 3 Way-Luxfer Pressed Tile (design as selected) as made by the AMERICAN 3 WAY-LUXFER PRISM Co. These lights shall be in rigid panels, weatherproof and waterproof.

3 Way-Luxfer Geometrical Design Transoms

Geometrical designs for transoms are offered where some general design scheme may be intended and where the standard 4-in. squares or larger may not be desired. By using sheet prism glass in the construction of transoms, the same very satisfactory daylighting can be obtained as with the use of tile prism. However, in addition to the prism glass designs, we are in a position to fabricate these same panels from almost any other type or pattern of glass, and in every case these panels are built to fit the transom and, where necessary, are divided into suitable sections made interlocking by our improved 3-Way lock joint process. 3 Way-Luxfer Transoms are adaptable to any type of store front construction.

3 Way-Luxfer Sheet Prism

A prismatic sheet glass which, like the tile prism, is the only commercial adaptation of the natural law of light refraction, and may be best used in windows or openings where a maximum redirection of the light into dark interiors is desired. Easy to clean—therefore the maximum light transmission can be maintained. Can be furnished with or without wire in any size up to 60 in. high by 120 in. long.

3-WAY Daylighting Products

They daylight, they ventilate, they
beautify, they advertise, they
add distinction

3 Way-Luxfer Ventilators

While 3-Way Ventilators were originally designed and built by us for use in our transom lights, the demand for a well constructed inexpensive type of ventilator has grown to such an extent, that we have been called

upon to build a number of different types of ventilators, so designed that they may be used for various purposes and for different types of setting.

Construction—These ventilators are light weight, but because the frames are built of angle steel, securely and solidly riveted inside of a mounting frame of angles, channels or flats, they are very strong and rigid.

Ventilators can be furnished in the pivoted or swinging type, or in the hinged type as may be desired. Standard frames are electro-galvanized but can also be furnished copper plated.

Something New in Bronze and Aluminum Ventilators

With the recent increased use of bronze and white metal for store front construction and windows, as well as interior work, we have found it necessary to equip our shop to make our ventilators in the standard commercial bronze and aluminum and we are now prepared to build our various types in either the bronze or aluminum as well as the steel.

These ventilators are built essentially the same as the steel ventilators, light weight but very strong and rigid, and the cost is low considering the quality.

Can be furnished in either the natural finish or plated.

These ventilators do not rust or corrode and should last the life of the building. Ventilators are obtainable through your store front contractor or glass contractor.

Details and prices on all types of ventilators are available upon request.

Removable Flat Screening—The specially designed 3-Way Removable Flat Screening can be provided for all of our standard types of ventilators. It is made of 24-mesh copper or bronze wire cloth thereby serving to keep out much dust as well as insects.

BRASCO MANUFACTURING COMPANY

Patented Metal Store Fronts

HARVEY, ILLINOIS

(Chicago Suburb)

DISTRIBUTION AND COMPLETE STOCKS THROUGHOUT UNITED STATES AND CANADA

Products

BRASCO COMPLETE METAL STORE FRONTS in copper, bronze, Monel Metal, Extruded Bronze, Extruded Aluminum and Perma-wite.

Also Rolled and Drawn Metal Mouldings in copper, brass, bronze, aluminum, monel, nickel, zinc, steel, white metal and special alloys of all descriptions; Metal Covered Wood Mouldings; Metal Store Front Ventilators and Showcase Doors; Thresholds, Kick Plates and Door Guards.

For Davis Bronze or Extruded Aluminum Sash, Bars and Jambs, see Manufacturers' Index.

Brasco All-metal Sash

This heavy gauged sash can be obtained in both indirect and direct screw pressure types, *although we*

No. 514 Sash and Gutter as Used with Complete Sill Cover
No. 541

Fully indirect screw pressure and extra wide gutter

strongly recommend indirect screw pressure always. Note the typically wide drainage gutter and staggered vents in face and gutter to eliminate dust. Gutter No. 506 can be used in conjunction with this sash to provide a *complete self-supporting sash*, eliminating the necessity of wood backing.

All Brasco systems embody the essential elements necessary to insure *safety* and *permanence* in the setting of plate glass. They combine simplicity and practicability with architectural beauty. Such other features as ventilation, drainage and maximum daylighting are embodied, which, together with the principle of *indirect screw pressure*, reach the highest degree of perfection in all Brasco systems.

In all Brasco construction, safety to the glass is assured by a wide grip on the plate, and by the provision in the sash

LOCAL REPRESENTATIVE

for the absorption of movement and vibration by the setting.

Brasco Approved by Insurance Companies

Brasco utilizes what the insurance companies' statistics prove to be the safest method of holding glass. Outside stops fastened by the *indirect method* permit a *grip of a full 1/2 in.*, and what is most essential, an *unobstructed space of 3/8 to 5/8 in.* between the edge of glass and jamb.

Installation

An examination of the illustrations on these pages and of our complete details, catalogues and actual samples will immediately show the simplicity and efficient design which assure ease of installation and satisfactory, faultproof Brasco installations.

Service

All architects will find our Service Department always ready to gladly submit suggestive floor plans and perspective elevations. Prompt service and no obligation.

Literature and Samples

Actual full sized samples of all sash and bars in various metals.

Complete portfolio of full sized details on all systems.

New catalogue, embracing Brasco All-metal Sash and Davis Extruded Bronze, complete in every detail.

No. 516 Self-supporting Sash

Brasco Store Fronts may be obtained in Monel Metal, Bronze, Copper, Perma-wite, Davis Solid Bronze and Extruded Aluminum

Brasco Series 600—Advanced Store Front Construction

A Complete System in Monel Metal

Description

Monel Metal is a rustproof, non-ferrous nickel-copper alloy of permanent beauty. It combines strength, equal to that of high grade steel, with an unusually attractive finish of silvery lustre.

Adaptation

For the first time, this wonder-metal, used so successfully for a quarter-century under the most

assurance of ever increasing distinction and value.

Service

The various members comprising Brasco Series 600 include the standardized basic units of the modern store front. In addition, we are prepared to furnish solid Monel ventilators, showcase doors, sheets and soffit covers for entrance ceilings, special pilaster and post covers of all descriptions,

Series 600 in Monel Metal

Illustration shows the self-supporting type used in conjunction with sill 649. Gauge of sash face and back members .040-in.; of sill, .031-in. All attaching screws also of Monel Metal

difficult conditions in industry, lends its extraordinary properties to the advancement of store front construction.

Advantages

Lustrous silvery beauty in keeping with today's style in architecture—Absolutely rustproof—non-ferrous yet with the strength of steel—retaining its original brightness under all atmospheric conditions with a minimum of care, Monel Metal adds a new touch of perfection to the time-proven Brasco principles of safety and permanence. A *complete* hollow metal store front line is now available.

Once again the name Brasco comes to the fore in the march of store front progress and with it the

panels, complete bulkhead installations—in short, anything and everything required for the modern, individual store front.

Monel is available in both cast and sheet forms to match our rolled sections, thus widening the use of the construction. Attractive etched plates, panels and ornaments as well as cast crestings can be had promptly.

We particularly recommend polished finish Monel for store front use, but special finishes will also be furnished.

Samples

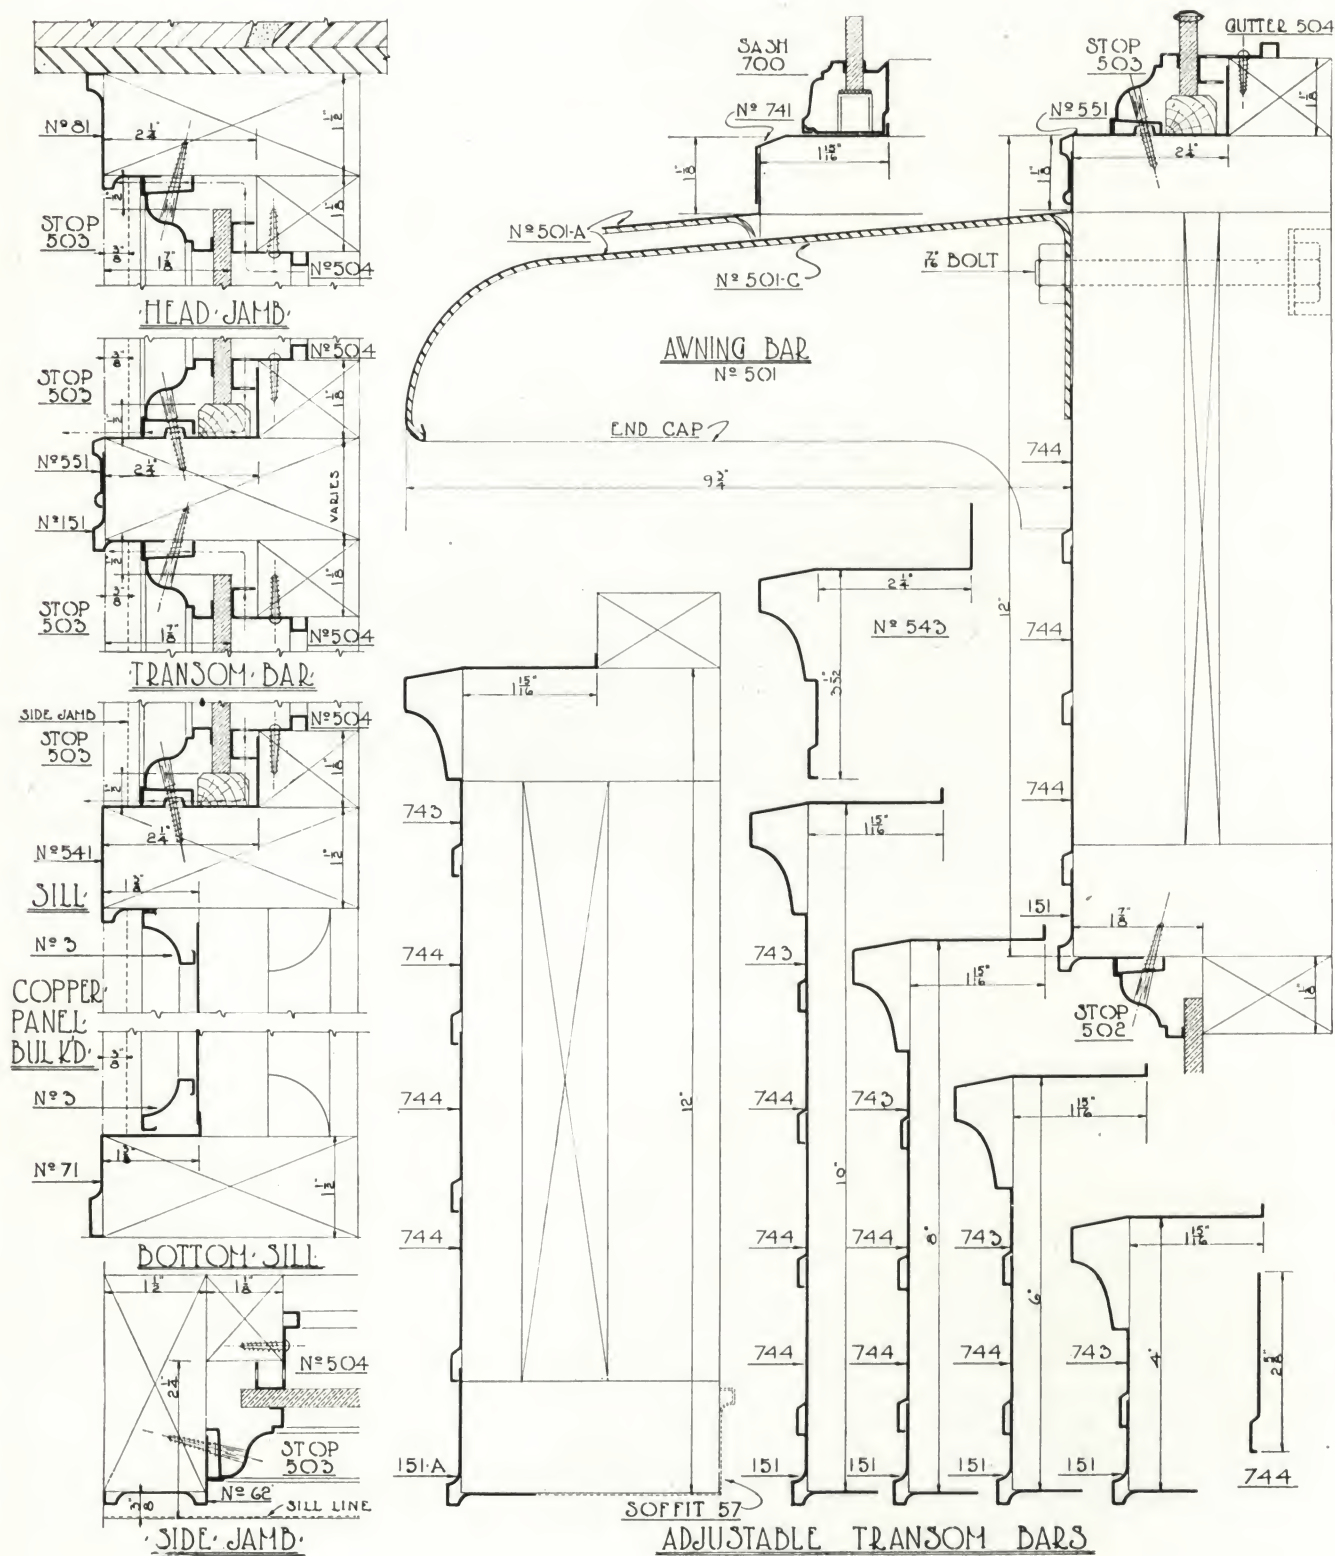

Samples of Monel Metal and other Brasco constructions gladly sent on request.

Brasco Store Fronts may be obtained in Monel Metal, Bronze, Copper, Permalloy, Davis Solid Bronze and Extruded Aluminum

DAVIS EXTRUDED SASH CO.

Extruded Bronze and Aluminum Store Fronts

LINCOLN, NEB.

Complete Stocks in New York and Chicago—Dealers Throughout United States and Canada

Davis Extruded Bronze and Aluminum

Complete, uniform, patented system of store front construction, embodying four types of sash, several sizes of corner, reverse and division posts and varied coverings for sills, side and head jambs, muntins, bulkheads, soffits, doors and frames, grilles, showcase doors, ventilators, crestings, enrichments and special items—providing for every modern store front need.

Heavy Weight Solid Extruded Bronze

All Davis members are $\frac{3}{8}$ -in. solid bronze. No hollow metal of any description is used in conjunction with Davis Sash.

To absolute glass safety Davis has added beauty, dignity, advanced design and permanence.

DAVIS
Solid Architectural
BRONZE SASH
"For Better Buildings"

Fulcrum Principle of Indirect Screw Pressure

The patented fulcrum principle results in maximum glass safety for the largest plates, without the necessity of putty or other unsightly compounds.

The grip on the glass is always positive and uniform and all glazing is done from the outside.

Complete Literature and Samples

Full size working samples of Davis Sash (or any other Davis section) gladly sent on request; also eight sheets of full sized details and special descriptive catalogue, illustrating many of the finer modern buildings, in which all store fronts are Davis set.

"HIMCO" ARCHITECTURAL EXTRUDED BRONZE AND STANDARD ROLLED SOLID COPPER, BRONZE AND ALUMCRO STORE FRONT CONSTRUCTION

The "Himco" Store Front Service

We offer to the architect a glass setting construction of extruded bronze for the highest quality fronts or of rolled solid copper or bronze for medium price work.

We do not erect these constructions but the sections are stocked by reputable glaziers throughout the country and are generally erected through the glazier, plate glass manufacturers, or setters.

Show Cases—We also manufacture show cases and show case doors to detail as shown on Plate 33-3. These show cases are made in solid copper or bronze in hollow metal type of construction. The door may be fitted in a number of ways, in the vertical intermediate bar, at the regular joint sections, etc., in store front construction. The door is made with a cylinder lock and can be made hinged or pivoted.

Transoms—These can be provided in a hinged or pivoted type. The construction is similar to the show case doors.

The Essential Elements for Satisfactory Store Front Construction

The principal factor in satisfactory glass setting construction is in holding the glass in a cushion-like grip which counteracts shocks from wind or vibration and yet provides for expansion and contraction.

The setting member must be so arranged that it is possible to set and remove glass in a minimum amount of time in case of accident as well as in first erection. A simple, quickly erected construction with a maximum amount of glass protection, with reduced labor charges.

The Materials of "Himco" Glass Settings

"Himco" Glass Settings are made in any type of non-ferrous metals, such as architectural extruded bronze and rolled solid copper, bronze, Alumcro (white metal) nickel-silver aluminum alloys, chrome nickel or chrome plated. Each type shown assures the greatest glass insurance.

The No. 400 Line Architectural Extruded Bronze Glass Setting with the Cushion Grip (Patent Pending)—For the very finest type of bronze store fronts.

(White Metal)

No. 400 Architectural Extruded Bronze Section

No. 402 Architectural Extruded Bronze Section

No. 60 Rolled Solid Copper Section

No. 33 Rolled Solid Copper Section

No. 34 same as No. 33 except that setting screw enters as shown by dotted lines

Glass sections can be supplied separately for cast bronze fronts by others if desired. No screws appear on the exterior.

The difference between the No. 400 and No. 402 Sections is the method of securing the front to the back plate and the type of glass support. The use of each is a matter of personal preference. In the No. 400 Section the front plate is secured by a bronze clip and in the No. 402 Section by a screw extending from back to front plate. In the No. 400 Section the glass rests on a leather pad over corrugated copper rocker channel while in the No. 402 Section the glass rests on a leather pad over a bronze Z-bar.

Inexpensive Rolled Solid Copper Bronze or Alumcro Glass Settings—

These settings for show window construction are equally good and are the same in cost. It is largely a matter of individual preference of moulding and setting construction that influences the selection of each.

The No. 60 Glass Setting (Patented)—

This has the spring type grip on the glass, the rolled mouldings holding the glass safely, yet resiliently. The setting screws pass through a tube from the front to the back member assuring freedom of the contact between the glass and the screw.

The No. 33 Glass Setting (Patented)—

Based on the same spring type grip as No. 60, but is secured differently. The screw in this section passes almost vertically through the front and the bottom of the back member. This should not be specified for use with marble, cast iron or bronze base; use No. 60 Section for this service; or if the design of No. 33 is still preferred, use it for jambs and head, and No. 34 for base.

The No. 34 Glass Setting (Patented)—

Is the same type as No. 33 except that the screw goes through at the same angle as in No. 60 setting. The No. 34 setting is used in combination with No. 33 as the bottom member of the setting where the base is marble, cast iron or bronze with which the wood screw cannot be used.

Finishes

The standard finish of the bronze or copper store front construction is in the natural finish. Special finishes such as statuary copper, oxidized copper, statuary bronze and gunmetal, may also be supplied.

"HIMCO" 400 LINE ARCHITECTURAL EXTRUDED BRONZE STORE FRONT CONSTRUCTION

(Patented and Patent Pending)

The New "Himco" Cushion Type Bronze Setting (Patent Pending)

The new extruded bronze section offers an entirely new feature in rigid bronze store front construction. Our new cushion type glass setting eliminates the objectionable feature of rigid construction as the cushion grips the glass firmly yet allows for expansion and contraction of the glass. The cushions of finest rubber are held in place as shown on the section.

NO. 400

No Screws Show on the Face of the Setting

The setting section consists of only two shapes, the front and back plates. The front plate is held in place in the No. 400 Section by means of bronze clips. In the No. 402 Section the screw extends from the back to the front plate and holds it securely in place. No screws are visible on the exterior, giving the appearance of a strictly architectural cast bronze construction. Corner blocks or regular mitres may be used.

NO. 402

FULL SIZE SECTIONS THROUGH GLASS SETTING

The Any Angle Extruded Corner Construction (Patented)

Only one section is required for any angle desired. The side wings are connected to the central upright by a gear type construction. When the front part of the upright is screwed tight from the inside the side wings are held rigid and secure. Any angle of 5°

PERSPECTIVE SECTION SHOWING CONSTRUCTION OF RUBBER CUSHION GLASS SETTING NO. 400 & 402

or more can be made with this corner. The only variation is on the interior spring grip for which the proper angle is supplied.

In Specifying—We suggest that our glass setting section be included in all cast bronze store front construction whether the balance of the work is done by ornamental bronze contractor or the entire front is furnished by us.

Corner can be set to any angle in multiples of 5°

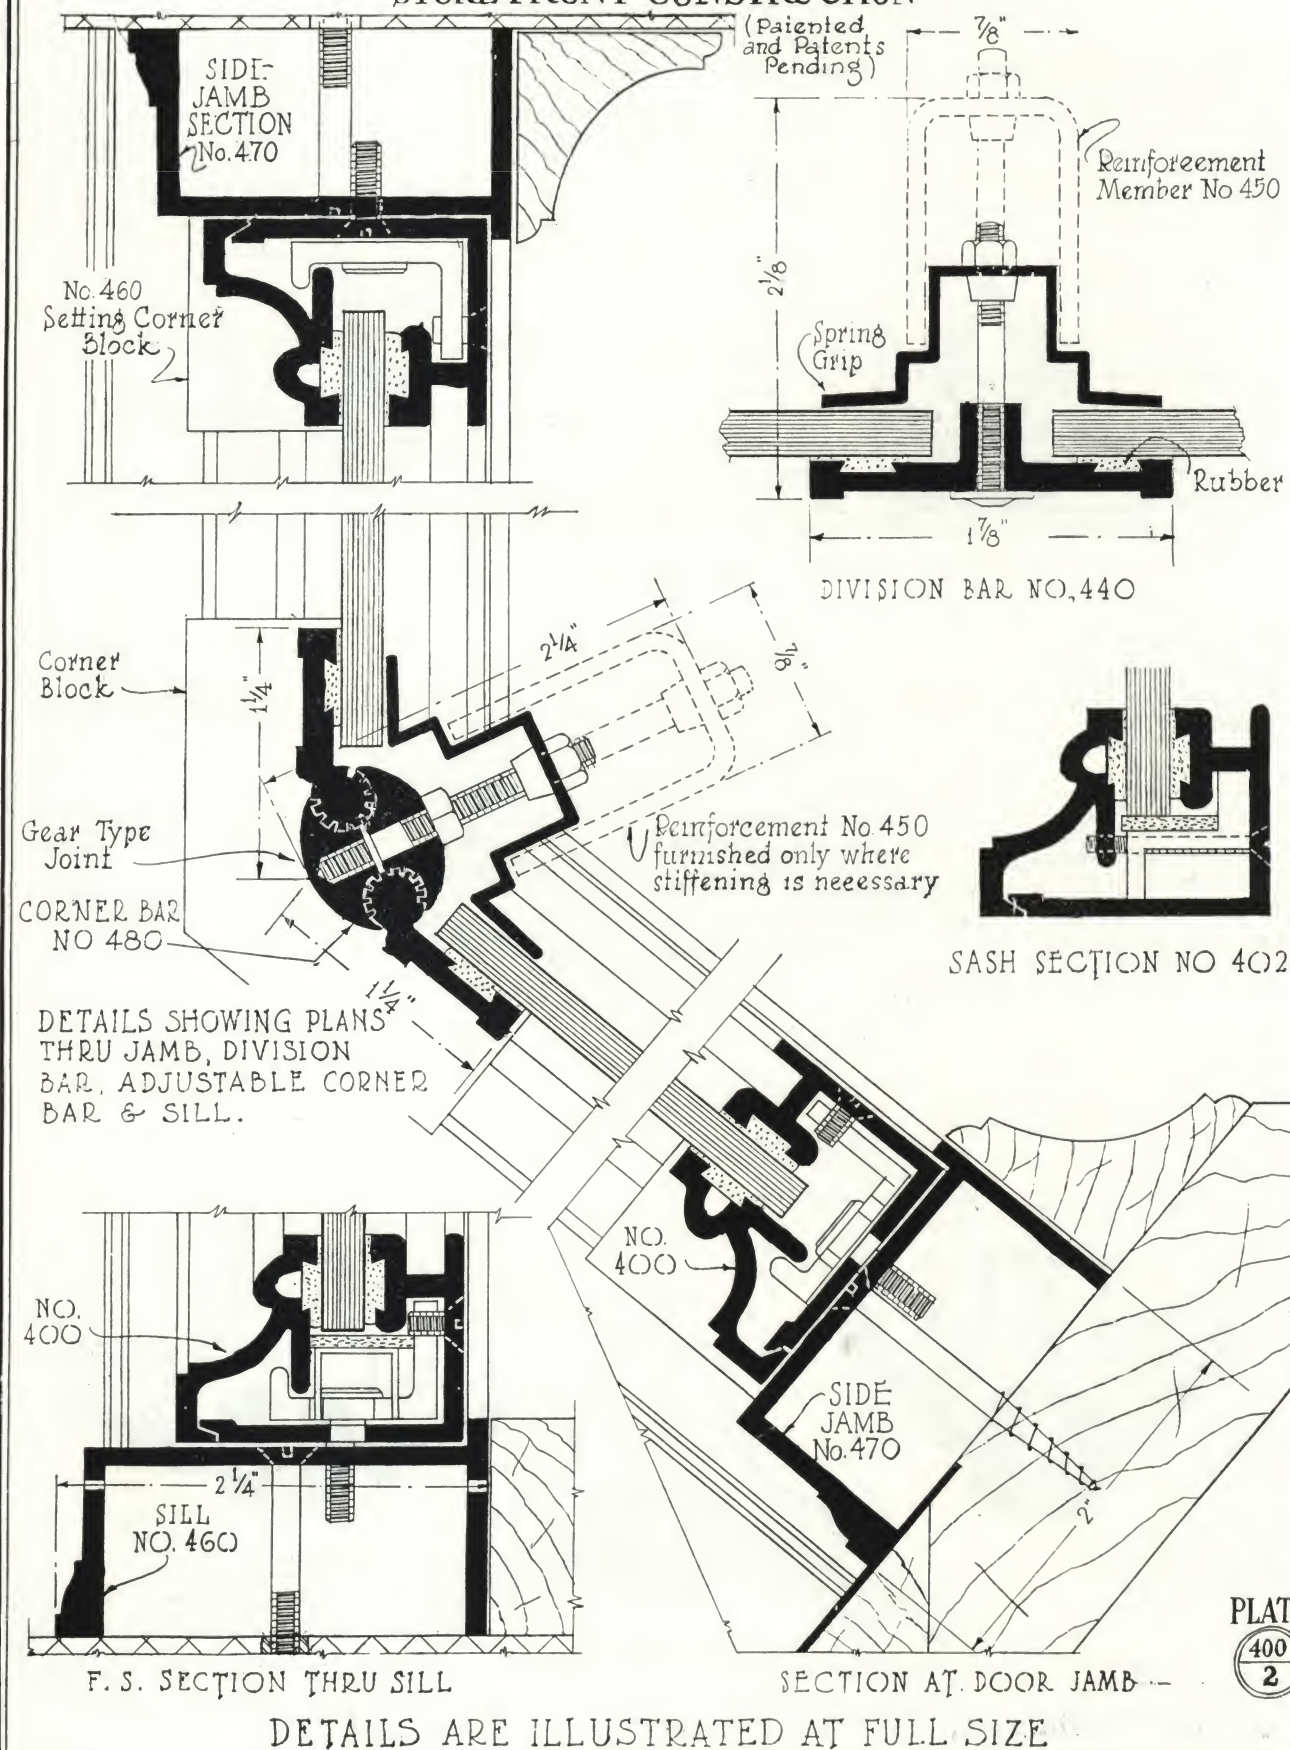

Patented DETAILS FULL SIZE

The gear type joint allows change of angle but is rigid when bolted tight

2

"HIMCO" 400 LINE ARCHITECTURAL EXTRUDED BRONZE STORE FRONT CONSTRUCTION

"HIMCO" SOLID COPPER, ALUMCRO^(WHITE METAL) OR BRONZE STORE FRONT CONSTRUCTION

No. 60 GLASS SETTING (Patented)

This glass setting is a screw pressure spring type section. The two parts, front and back, are held in place by screws which pass at an angle through the front plate, through brass tubes secured to the back plate and then into the wood or metal covered backing.

The slip joint between the front and back member automatically adjusts face member to position. The position of the face holes and tubes for the screws are accurately spaced by tool steel dies, assuring economy and accuracy in installation.

The glass rests on leather strips supported by corrugated copper channels. These channels are spaced along the bottom of the glass setting.

The Advantage of the Brass Tube in Setting—The brass tube eliminates the danger of the glass coming in contact with the setting screw. The screw entering at an angle draws the face plate down and inward and spreads the pressure against the glass uniformly throughout its length. This removes the danger of excessive local strain and uneven tension.

Ventilation and Condensation—There is a direct system of ventilation on all sides of the glass setting. Holes are spaced on centers which act as weep holes for any condensation and for ventilation from the outer air to the inner surface of the glass. The front vent holes indicated on the drawings have baffle wings which prevent direct drafts and dust from entering show windows due to wind pressure or storms.

F.S. DETAIL OF CONSTRUCTION OF No. 60 GLASS SETTING

CORNER BAR NO. 41 CB

Corner Bars—These are made to fit any angle of glass setting desired. The patented method of bolting together the outer and inner sections, eliminates the use of clips, one of the commonest causes of glass breakage.

The bar constructions not only permit glass of varying thicknesses to be joined but provide equal pressure on both pieces of glass.

DIVISION BAR NO. 45 CB

Note.—The front members of these bars are copper covered. The back members are solid copper.

If back members are desired in copper plated steel, omit CB from the members as 41, 42 etc.

REVERSE BAR NO. 42 CB

Construction of Corner—The corners are formed up of drawn steel sections to give rigidity and strength and are bronze plated. The sections exposed to the weather are covered with drawn copper or bronze.

Use of Corner Bars—The drawn steel corner bars are used interchangeably with either the No. 60 or No. 33 type of setting.

"HIMCO" ROLLED SOLID COPPER OR BRONZE STORE FRONT CONSTRUCTION WITH NO 33 GLASS SETTING (Patented.)

This type of setting is very similar in principle of construction to the No. 60 Glass Setting. The moulding of the front is different but is of the same spring type construction. The principal difference is in the method of securing the glass setting to the frame.

The screw in the No. 33 Setting passes down through the front plate at a steep angle then passes through both front and back members into the wood or metal covered backing. The setting screws entering on an angle draw the two plates together and spread the pressure on the glass uniformly over its entire length.

There is no chance of the glass coming in contact with the setting screw.

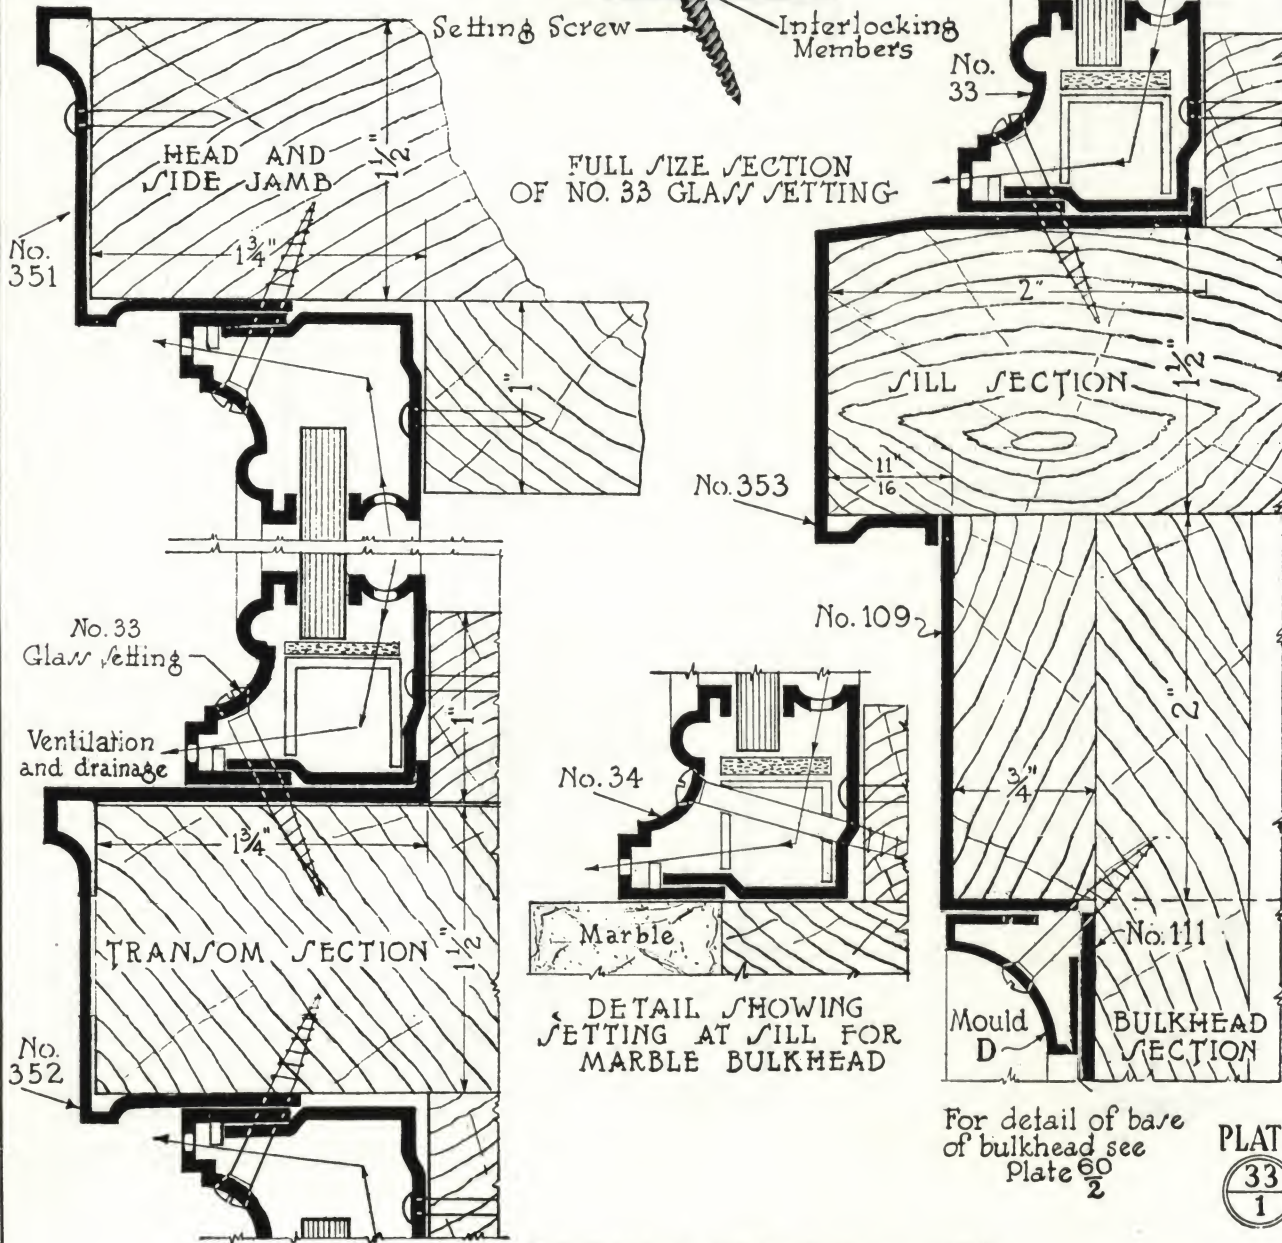

Glass Safety—The glass is held in a resilient cushionlike grip that counteracts shock from wind or vibration and it provides for expansion and contraction.

The holes for the screws are accurately spaced by steel dies for both members assuring ease of erection as well as accurately drawing the parts together.

Corner Bars—The corner bars illustrated on Plate No. 60-1 are used with the No. 33 glass setting in the same manner as for No. 60.

STOREFRONTS of cast and extruded bronze, aluminum, Monel metal and nickel.

AWNING BARS. Semi-automatic, self-concealing awning bar feature. (Patent applied for.)

For our pages on Ornamental Brass and Bronze Work, Solid, Kalamein, Hollow and Extruded Doors, Windows, double-hung and casement types, Grilles, see Manufacturers' Index.

For Iron Work and Lighting Fixtures, see our Midwest Metal Art Division in Manufacturers' Index.

Facilities

Plant contains 226,000 sq. ft. of space, and gives employment to 450 skilled craftsmen. Specialists in highest grade architectural ornamental metal work of every description, and particularly storefronts.

Engineering Department at your service. Will be delighted to submit sketches, specifications and estimates of cost covering standardized or special design storefronts of all kinds.

Description

Newmanco Storefronts are constructed throughout of solid heavy metal. The outstanding feature is their adaptability. As will be seen in our details, the entire front is made of extruded members (except where it is more practical or architecturally desirable that we use castings or drawn shapes), and to this front we affix by the invisible method such of our stock design cast ornaments, crestings, etc., as may be specified. This means that we have basic designs which are extremely flexible, and therefore can be utilized for any store of any architecture. And in addition, we make very *special bronze, monel metal, aluminum and nickel storefronts to order.*

Before detailing a metal storefront of any kind, may we suggest that you communicate with us? Given the necessary measurements and an elevation sketch, we will prepare drawings of a front or fronts exactly adapted to the job, and these will be sent with estimates of cost, positively without charge or obligation.

We have scores of stock design pilaster caps and bases, crestings and ornaments not shown in this section, and will gladly send blueprints, if you are designing an elaborate front, together with elevations of several different modern storefronts. Would you like to have tracings of some of the fronts shown herein?

For bulkhead grilles, see our Grille pages.

Awning Bar Feature

Our new and greatly improved awning bar feature (patent applied for) is a radical departure from the usual method, and has become recognized as the first practical means of concealing and protecting the awning. The only visible sign of an awning is the spindle arm, for when not in use the front bar is behind the swinging panel in the frieze of the cornice hidden section.

hidden section.

Points of Superiority

(1) Made throughout of solid heavy metal—not kalamein or sheet metal construction. Last forever, and require the minimum of upkeep expenditure. No refinishing cost. No replacements.

(2) A style for every front, and readily adaptable to any layout, with standardized designs sufficiently flexible to give an almost unlimited range. We are *not* confined to the glass-setting mouldings, etc., shown on succeeding pages.

(3) Extra heavy extruded or drawn members insure rigidity, eliminate unsightly waves and buckling, and positively prevent sagging and the resultant glass breakage.

(4) Especially beveled shapes permit of adjusting the fronts to any angle, without changing the style of the various members.

(5) Glass-setting mouldings (patent applied for) are self-adjustable to any thickness of glass, with plenty of excess rabbet space, making for a perfectly airtight, waterproof and dustproof contact.

(6) Screws are applied from the inside, but may be applied from the street side, if necessary.

(7) Glass may be easily tightened by merely turning down the screws which hold the members in place.

(8) Sub-frame so designed as to take your choice of our large variety of stock glass-setting mouldings.

(9) Greatly simplified drainage system.

(10) Cornice is adjustable to any awning bar construction of standard make.

(11) Awning bar feature (patent applied for) permits of automatically concealing and protecting the entire awning, greatly adding to the appearance of the front when the awning is not in use. This feature is applicable to nearly every type of awning mechanism.

(12) Future alterations are inexpensive, as the corner construction, cornice, transom bar, etc., all are adjustable.

(13) Easily erected, due to the adjustability of the entire construction, and the scientific interlocking of all members.

(14) May be finished in any natural polished or electroplated finish.

"EASYSET" SYSTEM of METAL STORE FRONT CONSTRUCTION.

Also Awning Covers, Kick Plates, Thresholds, Special Mouldings, Showcase Doors, Grilles and Ornamental Store Front Construction.

For Structural Glass, Flat Sheet Window Glass, Vista Plate Glass, Tapestry Glass, Mirrors, Ultra-Violet Ray Window Glass, Paint and Varnish, see Manufacturers' Index.

Construction

A careful study of the principles involved in "Easy-set" Store Front Construction will convince you that it is practical and satisfactory.

In the development of "Easysat" we have striven to achieve store fronts unique and architecturally beautiful in design, simple and practical to install, and last but not least—durable.

The first cost of "Easyset" is the only cost. Ex-

pensive periodical repairing or renovating is practically eliminated.

New Features

Many new features and methods of ornamentation have been added to the "Easyset" line which we are

sure will be welcomed by those desiring unusual individuality and character.

Installation

The "Easysset" system, as the name implies, is easily and quickly installed. Skilled men or special framing are not required to prepare store front openings for this construction.

Catalogue and Full Size Details

Our Catalogue "L," just recently published, features the complete "Easyset" system of copper or bronze store fronts illustrated and detailed. Write for it.

We also furnish full size working details for the asking.

VERTICAL SECTION - BULKHEAD N°101

EASYSET SASH AND BARS

(Full size details)

**25-B**

A sash made of heavy copper or bronze for all around use. Set from inside—no screws through face

**25-C**

An extra heavy sash for holding large plates of glass. It is perforated for use with backing

**25-D**

Similar to 25-C, except that it is self-supporting. Its lines are well proportioned and refined

**No. 4-B
Division Bar**

All Easyset sash and bars are made of solid copper or bronze unless otherwise indicated. They possess handsome lines and provide for ventilation and drainage when desired. With but few exceptions the face members are chased with the ornamental design if preferred

CARBOLINEUM WOOD PRESERVING CO.

PIONEER AND ORIGINAL COMPANY INCORPORATED

Carbolineum Building, 518-520 Highland Street
MILWAUKEE, WIS.

Address Sole Manufacturers at Milwaukee—No Eastern Branches or Successors
Used All Over the World Since 1876

CABLE ADDRESS
"CARBOLINUM"

Product

The original and genuine CARBOLINEUM registered in U. S. Pat. Off. No. 14048, is always sold with inventor's name added, as: Avenarius Carbolineum. The arrow trade-mark makes identification easy.

Appearance

The Rustic Nut Brown Stain it applies to the wood makes it well suited for dwellings and other outside woodwork in place of paint.

Prologue

In 1876, when the late Richard Avenarius invented Carbolineum, and originated wood preservation by simple surface treatment, the public did not take it seriously, having in mind the plentiful timber supply then available. Now, however, preservation of wood is a necessity, due to the cost of lumber and the long life required of wood used in modern construction.

Avenarius Carbolineum

A thin heavy oil ready for immediate use. Will not dry up or evaporate.

Its cost is reasonable and far less than lead or oil paints. The covering capacity is as great or greater than the best oil paints.

Wood Preservation at Construction Site

The wood preserving can be done at the point of construction by simply applying Avenarius Carbolineum with a brush, mop, sprayer or a few minutes' submersion of the lumber.

Always Uniform in Quality

Avenarius Carbolineum preserves wood against dry-rot and premature decay. It is especially prepared for the purpose and always produced in only one standard grade of uniform quality. Thus, results in the future will positively satisfy as heretofore; and the present-day user is assured of adding at least 100 per cent to the life of any wood.

No Increase in Fire Risk

It contains no volatile ingredients and does not increase fire-risk.

Spraying

Brush or Mop

Dipping

Methods of Applying Avenarius Carbolineum

Wood in Concrete Construction

Concrete supplies ample moisture; airtight construction is impossible—an ideal condition for growth of ever present decay fungi, causing rot and dry-rot—thus a preservative is essential, and there is none better than Avenarius Carbolineum.

Reputation

Avenarius Carbolineum has established its reputation for highest quality and uniformity. Its preservative value is no theoretical conclusion, but is based on actual results. References can be supplied by us from nearly every locality in the United States.

COST AND COVERAGE, BRUSH AND SPRAY APPLIED

Lumber	Cost per 1000 sq. ft., 2 coats		Coverage, sq. ft. per gal.

*For second coat, one-quarter to one-third as much required.

COST AND COVERAGE, DIPPED

Cost per 1000 ft., b. m. \$6.00 to \$12.00*	Coverage			
	Timber, in.			Boards, in.
Size	6x6	4x4	2x4	1x4 1x2
Gallons required	6	8	10	12 14

*According to size and correspondingly larger or smaller surfaces.

Specifications

A wood preservative known as Avenarius Carbolineum, manufactured by the CARBOLINEUM WOOD PRESERVING CO., Milwaukee, Wis., shall be used on

It can be used in its natural state when the temperature is above 75° F., otherwise when quick penetration is desired or on damp or partly seasoned wood, it shall be heated to 100° to 150° F. and applied hot. (Boiling point about 500° F., heating causes no danger with reasonable precautions.)

(Specify method of applying.)

Brush or Mop—After lumber is trimmed or framed, apply Avenarius Carbolineum liberally with a wire bound or rubber set long handle brush or mop. Saturate well at all cross cuts, mortises, tenons and knotty spots. In old wood, where decay has already started, decayed parts should be removed before applying oil.

Spraying—(When a large amount of surface or wood in structure already erected is to be treated, the spraying method can be used best.) Avenarius Carbolineum is to be applied with any efficient spraying or paint machine.

Dipping—(When the treatment of a large amount of lumber comes in consideration, this method is the most economical.) After trimming timber or lumber, immerse it in Avenarius Carbolineum. 1-in. lumber to be submerged about two minutes. Add two minutes for each additional inch of lumber thickness.

Free Samples

Upon request we will be glad to send a liquid sample of the preservative or a sample of board which has been treated. No obligation.

Warning

Anyone offering other material under similar name, is deliberately attempting to confuse and mislead the public.

LIGNI-SALVOR—THE WOOD PRESERVING STAIN

A Thorough Preservative That Does Not Deteriorate

Ligni-Salvor is more than a surface treatment, more than just a creosote oil; it is a beautifier as well as a preserver of wood. It is a scientific blend of the active principle of creosote with other oils. Its processing requires six weeks and the finished Ligni-Salvor is not released until after it has been aged twelve weeks at least.

Ligni-Salvor handsomely emphasizes the grain of the wood and renders that natural brown tone popularly known as an antique, or rustic, effect. Dull and glossy finishes are equally easy to obtain and where a dark brown or black is desired, the addition of up to 2% of lampblack will attain the color.

Ligni-Salvor penetrates into the innermost pores of the wood, killing all wood-destroying fungi and their spores. Thus it insures permanently against dry rot, decay, and all the elements that tend to shorten the life of lumber.

How Ligni-Salvor Is Used

The Surface—Ligni-Salvor is more than a surface treatment; the deeper it penetrates the better it preserves. The wood must be thoroughly dry and its pores must be open. The surface must be smooth and clean (naturally, unpainted).

Consistency—Ligni-Salvor is an oily substance which flows freely and covers readily. In very cold weather it must be warmed up to make it flow freely. Never must it be cut down or diluted. The specific odor disappears in time, usually two weeks.

Three applications are necessary, no matter how sufficient the first application may look. Remember, it is not the surface covering you want but the penetration. Allow at least 48 hours between applications.

Application—On Plane Surfaces of Wood-work—Apply as paint with stiff wirebound bristle brush.

On Shingles—Shingles should be dipped wherever possible and when laid given a heavy coat with brush or any standard painting or spraying machine.

Various Finishes Obtainable with Ligni-Salvor

Wax Finish—Obtained by rubbing down with cheesecloth after each of three applications, until wood is thoroughly dry and no more material will rub off. A weighted polishing brush is recommended for floors.

Flat Brown Effect—Obtained by giving only one application and rubbing down as above.

Silver Grain Effect—This effect is obtained on open wood by giving the usual three coats of Ligni-Salvor followed by one coat of white paint which is wiped off before it is dry.

Coverage of Ligni-Salvor

Ligni-Salvor will cover 300 to 350 sq. ft. of dressed lumber per gal. For 1000 shingles to be dipped, with an extra brush, about 2½ gal. are required.

Packing

Ligni-Salvor is packed in 5 gal. steel kits; 25 and 50-gal. drums; and 50-gal. wooden barrels.

A Few Well-known Structures on Which Ligni-Salvor Was Used

Andrew Carnegie Residence, New York, N. Y., Babb, Cook & Willard, Architects

"FALBA" CONCRETE FLOOR HARDENER

Description

A dry, small crystal, readily soluble. The solution penetrates into the concrete, fills up its pores, forming a hard surface, proof against water, dust, and wear.

Treatment

The "Falba" treatment consists of one or more applications of a solution of the "Falba" Hardener.

The solution for the first application is prepared by dissolving about ½ lb. of hardener in 1 gal. of water. For the second and subsequent applications the solution is made

with about 2 lb. of the hardener to each gallon of water.

In no case should one application follow in less than three-quarters of an hour after the preceding one. The surface treated should be kept wet with the solution for at least three minutes at each application so as to replace any of the solution absorbed at once by the concrete.

Packing

"Falba" Concrete Floor Hardener is packed in kegs of 50 and 100 lb. Barrels of 442 lb.

Products and Services

WOOD PRESERVATIVES to standard specifications of the American Wood Preservers Association, United States Government, and various national engineering associations—a gallon or a tank car.

Protexol, Neosote and Osco represent the highest grades produced from anthracene oil for brush, spray or open tank treatments; Creosote Oil to recognized specifications; a gallon or a tank car. Protexide, the colorless and odorless preservative.

Pressure treatments by all standard salt processes as zinc chloride, sodium fluoride or fluorphenol.

Fireproofing by the Max Bachert (Electric) Process to New York Building Department requirements.

Combined preservative and fireproofing treatments for structural timber, especially timber roofs.

Dyeing or transforming of wood—This is accomplished by the vacuum pressure method when ebonizing or otherwise transforming wood. Hardwood and other veneers are produced with the same equipment. Fuming to any desired shade.

Kiln drying of wood.

Fireproofing, dyeing and wood preservation require a specialized knowledge of the structure of wood, causes of decay, antiseptics, chemicals that act as fire retardants and means for effecting satisfactory treatments. This organization acts as consultants on matters pertaining to timber treatments.

Facilities for Treatment

The equipment includes two pressure cylinders or retorts and three 25,000 ft. capacity dry kilns. Investigation and inspection of works is invited. Treatments are warranted to pass the requirements of New York City as tested by Columbia University. References upon request.

Fireproofing

This term is used to describe the complete impregnation of wood under pressure with chemicals so that shavings from the interior will not receive, sustain or transmit flame.

Flameproofing is a term used to designate impregnations with more limited quantities of chemicals. Such treatments are recommended for temporary wooden structures as for fairs or expositions, for scaffolding, contractor's shanties or hoist towers. Specify Protexol Flameproofing.

For interior woodwork of fine residences, schools, churches, libraries, museums or art galleries it is recommended that fireproofing by the Bachert Process be specified.

Flameproof preserved wood is offered for structural requirements. This combines in one treatment chemicals that will prevent decay with fireproofing chemicals precipitated in the wood in an insoluble form; suitable for interior or exterior work. Specify Pyresote Process.

Fireproofed wood is practically stainless and can be given any desired finish with stains, waxes, varnishes or paint. The gluing properties of wood are not affected.

Principles of Fireproofing—The basic principle of fireproofing wood is to prevent the spread of a fire. The aim is to increase the resistance which such wood offers to burning. It is not to be assumed that such wood will endure indefinitely an increasing attack of flame without charring or disintegrating. Wood properly fireproofed will not receive, sustain or transmit flame. All flame existing will be only that of the extraneous substance. When flame or intense heat is applied to fireproofed wood, the wood will char at the point of contact, but it will not burst into flame and the destructive effect of the heat will be confined to the point of contact with the flame. Thus, the fireproofing of wood aims at the permanent elimination of the property of inflammability from wood.

Combustion is controlled by injecting into the wood chemicals which upon decomposing give off non-combustible gases which mix with the inflammable gases given off by heated wood and render them non-combustible. Other chemicals give protection by fusing or forming a glasslike coating over the fibers of the wood, while a third class of chemicals used gives up

TRADE-MARK

waters of crystallization which are gradually released as the wood is heated during a fire. These chemicals which are injected into the wood must be so precipitated in the wood that they will remain fixed until liberated by heat.

An interesting case proving the permanency of the Bachert Fireproofing Process is that of the R. G. Dun Building in New York City erected in 1897. In 1926, or 29 years after its erection, a fire broke out in the building adjoining on the north. The fire attacked the wooden window frames and sash on some ten or twelve stories, but the fire was not communicated to the Dun Building since the fireproofed wood while decomposing did not ignite.

The Bachert Electric Fireproofing Process was adopted by the United States Navy for battleships, cruisers, torpedo boats, etc., on July 25th, 1895.

Tests—Tests for permanence were made on duly authenticated specimens in accordance with the Rules for Testing Fireproofed Wood approved and adopted by the Bureau of Standards and Appeals, New York City, which require for the shavings test a temperature of 800°, and for the timber test a temperature of 1700° F., with results noted below:

Building	Wood		Shavings Test		Timber Test		Un-burned area, %	Required %
	Species	Age, yrs.	Flame	Glow, sec.	Flame	Glow, sec.		
Belmont Hotel.....	Red oak	24	none	none	none	5	63	55
Commercial Cable Building.....	Mahogany	33	none	none	none	2	67	55
Hotel McAlpin.....	Red oak	18	none	none	none	3	85	55
R. G. Dun Building.....	Red oak	33	none	none	none	2	77	55

Preservative Experience

For over 50 years Protexol quality applied by brush, spray or open tank has been successfully used for the surface treatment (brush, spray or open tank) of timber to prevent decay and the attack of insects. Protexol (protects all) represents value demonstrated by actual time tests—by results.

It is the "standard" wood preservative for surface treatments established by practice.

Wood Preservative for Various Service Conditions

Where the Greatest Protection Against Decay Is Desired—Protexol Wood Preservative No. 1 is recommended especially for use where brush or spray treatments are used. Also where non-inflammability of the treated timber is an important factor, and the color of the treated wood is important. Made to the 53-year-old standardized quality.

It is a non-volatile, heavy oil derived from the highest boiling distillate of coal tar. Its constituents belong to the anthracene group, the permanent antiseptic properties of which are acknowledged.

After filtration and refining, the oil is chemically treated to improve its character and to increase its viscosity and efficiency.

Where Structures Are Temporary and a Lesser Degree of Protection Is Required and Lower Cost Is a Factor—Protexol Wood Preservative No. 2 is recommended where waterproofing of timber is the prime object sought. Also recommended for heavy open tank treatment. It is a straight run anthracene oil which meets the chemical standard of the carbolineum type of preservative.

Where It Is Desired to Destroy, at a Low Cost, Organism on Sound Timber Not Liable to Decay—Neosote Wood Preservative No. 1 is recommended where the lowest cost compatible with a satisfactory return is sought. Also used for open tank treatments where depth of penetration only is considered the means of preservation or as a temporary preservative agent. It is a mixture of lighter anthracene oils and heavy creosote oils to give a liquid grade preservative suitable for surface treatments.

Neosote Wood Preservative No. 2 is a heavy distillate oil for the same purpose as Neosote No. 1 but is less permanent and less expensive than Neosote No. 1.

Standard grades of creosote oils for pressure treatments because of their volatility and content of crystallizable salts are not suitable for surface treatments.

Notes: It is worth bearing in mind that the item of labor cost will be substantially the same in the application of any one of the four grades. Equipment cost will likewise be substantially the same except where heavy open tank treatments are desired.

Protexol No. 2 and Neosote are more volatile and their use is not expected to insure the factor of safety to be had from the use of Protexol No. 1, except that a larger quantity of Protexol No. 2 and Neosote will probably give the same results as a smaller quantity of Protexol No. 1.

Odorless Wood Preservative—Protexide—A fluorophenol preparation, using sodium fluoride as a base, combining high toxicity with low solubility. Non-corrosive and applied in an aqueous solution of 3% to 5%. Especially prepared for treatments which will require subsequent applications of varnish or decorative paint or for woods with low absorbing qualities. Also used for vacuum pressure treatments.

Cost of Surface Treatments

While variable, will run from 1¢ to 1½¢ per sq. ft. of surface area. Brush treatments will add approximately 1% to the cost of a completed wooden structure. Spray treatments will run about \$1.00 per gallon applied or 1¢ per sq. ft. for the best grade of Protexol Wood Preservative. Open tank treatments vary in cost according to the desired absorption and grade of preservative employed from 4% to 10% of the total cost of a complete wooden structure or 10% to 15% of the timber used.

Types of Buildings, What and How to Treat

The following table suggests the wood requiring preservation from decay in various types of buildings:

Type of Structure	What to Treat	Method Recommended
Schools Hotels Libraries Banks Offices Apartments Department stores	Furring Screeds Sleepers	Empty cell
Mill construction	Girders Sleepers Sills Subfloors Plates	Full cell
Timber roofs	Roof members Roof planking	Empty cell or combination treatment

Protexol is a permanent, rich, walnut stain and preservative for shingles, half timbers, trellises, arbors. Correspondence is invited on any stated requirements.

Notes on Grade and Amount of Preservative to Be Used

This must be varied with the conditions of exposure and the quality and characteristics of the timber used. The desired protection against decay-producing influences is a further factor. How small a surface a gallon can cover rather than how much determines the protection afforded.

Since the permanence of oils in treated wood is generally considered a sound basis for comparison of value, it is suggested that the same factor be used in determining the amount of preservative and the treatment to be specified for similar conditions of exposure.

It should be understood that where it is desired to use lower grade preservatives consideration should be given to the use of a greater quantity. In brush treatments, this is accomplished by specifying three to four brush coats. In open tank treatments these results can be obtained by variations in time and temperature of the hot and cold baths.

It is always well to bear in mind that the smaller the absorption of the preservative, the more important its permanence since the rate of evaporation of the lighter oils is greatest from the outer portions of the wood.

Amount of Preservative to Be Used

The data in Table 1 include 5% for waste, except for spray treatments which allow 15%. Calculations are for lateral surfaces only. The end absorption in most

cases is but a very small proportion of the total and, except in the case of paving blocks or other short lengths, may be disregarded in estimating.

Absorption Requirements (Table 1)—

For rough, yard dry merchantable grade of long leaf yellow pine one gallon Protexol Wood Preservative No. 1 will be required for

- (a) 2 brush coats at 180° F. for every 90 sq. ft.
- (b) 1 spray application at 230° F. for every 80 sq. ft.
- (c) 2 spray applications at 230° F. for every 50 sq. ft.
- (d) 10-min. immersion at 180° F. full cell for every 80 sq. ft.
- (e) 20-min. immersion at 180° F. full cell for every 70 sq. ft.
- (f) 30-min. immersion at 180° F. full cell for every 60 sq. ft.
- (g) 60-min. immersion at 180° F. full cell for every 50 sq. ft.
- (h) Full Cell, Hot and Cold Bath Treatment
30-min. immersion at 180° F., 30-min. cold for every 40 sq. ft.
- (i) Empty Cell, Hot and Cold Bath Treatment
30-min. immersion at 240° F., 15-min. cold for every 60 sq. ft.

Note: The amount of preservative required depends, however, not only upon the dimensions of the timber but on the kind of wood, its absorbing qualities and its condition. Absorption varies and in Table 2 merchantable grade of L.L.Y.P. is taken as one hundred. This table gives factors by which the figures given in Table No. 1 must be corrected, when timber other than rough, yard dry, merchantable long leaf yellow pine is used.

Absorption Factors (Table 2)—

Timber	Dry			Green		
	Rough	Dressed	S.I.S.I.E.	Rough	Dressed	S.I.S.I.E.
Red cedar, poplar, cottonwood...	131	118	124	124	113	119
Sound square edge long leaf yellow pine, merchantable short leaf yellow pine, loblolly pine, white cedar, hemlock, birch, lodgepole pine...	113	102	107	107	97	103
Merchantable long leaf yellow pine, prime short leaf yellow pine, jack pine, slippery elm, tupelo gum, tamarack, redwood	100	90	95	95	86	91
Prime, long leaf yellow pine, pitch pine, Norway pine, western yellow pine, maple, cherry, ash, beech, white or soft elm, red oak, chestnut oak, chestnut...	94	85	89	89	81	86
Douglas fir, white pine, butternut, sassafras, catalpa, balsam fir, hickory, red gum, sycamore, cypress...	65	59	62	62	56	59
White oak, spruce, black walnut, honey locust, cork or rock elm...	56	50	53	53	48	51

Note: In estimating requirements, each kind of timber should be calculated separately as though it were of this kind and grade and then the proper conversion factor should be applied.

Tongue and grooved (matched) ship lap and splined lumber may for all purposes be estimated as dressed lumber.

Literature

A list of all available bulletins and circulars will be sent on request. Each answers definite questions on wood preservation.

Products

REPELLO, a Permanent Preservative Treatment for floors of wood, concrete, composition, terrazzo and linoleum.

REPELLO

TRADE-MARK

ing and dustproofing qualities result from the same action which occurs in an asphalt pavement—the elastic binder holds the grit resulting from traffic until it gets so hard that it glazes over.

Repello

Repello is a mixture of processed organic oils having no chemical effect upon any material to which it is applied. Its action is entirely mechanical as it fills the pores or voids, and remains an elastic and cohesive binder for years. This elasticity is essential to withstand traffic, to prevent penetration of dirt and injurious materials and to stop disintegration of floor when exposed to the action of the elements.

On Wood Floors—One application is sufficient for the life of the floor. Penetration is complete and the wood becomes so well filled that the finish remains even though part of wood be worn away.

Repello will penetrate entirely through an inch of maple flooring in about twenty hours, and leaves a permanent finish in the wood itself. A floor so treated will not stain or lose its finish.

Repello prevents warping, checking, dusting and splintering, because it is waterproof and prevents the disintegration of the natural wood resins. It leaves no film on the surface, but becomes a part of the wood itself and completely fills the pores. By keeping out dampness and moisture which are necessary to the life of fungi it prevents dry-rot.

By preventing the grain of wood from raising, it insures a permanently smooth surface and finish.

Repello in oak floors prevents the formation of discolored areas through the wearing out of the usual surface coatings and the subsequent action of air and water.

It prevents splintering and splintering; is one of the few materials which will make a pine floor resist the action of weather. When applied to wood sleepers, it prevents the usual rotting of the sleepers due to absorption of moisture from the concrete in which sleepers are embedded.

Illinois Merchants Bank Building, Chicago, Ill.
GRAHAM, ANDERSON, PROBST & WHITE, Architects
Maple and cork tile floors treated with Repello

On Concrete Floors—No other known treatment penetrates more deeply than Repello. This penetration varies, depending on the density of the concrete, usually between $\frac{1}{4}$ and $\frac{1}{2}$ in. It hardens the concrete to the full depth of its penetration by filling the tiny voids of the concrete with a tough elastic binder. The harden-

Repello renders a concrete floor waterproof, oil-proof and alkaliproof. It protects the floor from the action of fatty and other organic acids which result from the decomposition of oils and greases.

On Composition Floors—Dusting and disintegration of composition floors is prevented because of the waterproof binder deposited in voids of the floor.

On Terrazzo Floors—Prevents dusting and disintegration of the cement binder in terrazzo.

On Linoleum and Cork Carpet—Applied to linoleum and cork carpet, it penetrates the entire body of the fabric. When so treated they do not become brittle and the life is increased.

Repello Specifications

All concrete floors, after they have had their proper set [All wood floors after being properly planed and sanded] and approved by the architect, are to be treated with Repello to be furnished and applied by the manufacturers, SCOFIELD, EVANS & COMPANY, Commercial Trust Building, Philadelphia, Pa., or their authorized agents.

CALBAR PAINT & VARNISH COMPANY

Manufacturers of Technical Paints, Caulking and Glazing Compounds

FACTORY AND EXECUTIVE OFFICE

2620 North Martha Street, PHILADELPHIA, PA.

Products

CALBAR CAULK-O-SEAL NON-STAINING CAULKING, POINTING and GLAZING COMPOUND.

Also Calbar Industrial and Technical Coatings and Finishes.

Calbar Caulk-O-Seal Non-staining Caulking, Glazing and Pointing Compound

The necessity for a material having an elastic nature for sealing cracks, waterproofing and glazing prompted us some years ago to devote a large amount of time, money and effort to produce a product that would fill every requirement for varying conditions. After several years of constant experiments and gradual improvements we developed a compound which was considered the acme of perfection. Time has proven that our product is just right. Each feature has been carefully tested and we offer those, who are interested in a caulking compound of exceptional merits, Calbar Caulk-O-Seal Plastic Compound.

The saving of fuel from air leakage is an economic necessity. Heating and ventilating of buildings can not be controlled while there are cracks around doors and windows and other openings where air in unregulated amounts can enter. Of course, there are other things to consider also. Such openings allow dirt, dampness and deterioration to get in their work. It is well recognized at the present time that all buildings, from the modest two-story home to the highest skyscraper, require caulking. The cost is low and the benefit is great.

Caulk-O-Seal—Permanently Plastic Compound

Caulk-O-Seal is a permanently plastic compound that is impervious to heat, cold, moisture and fumes. It dries with a tough surface hide which can be painted over without bleeding through. Beneath the surface it remains plastic and pliable for years, taking up expansion or contraction of adjoining surfaces. Vibration does not harm it. It is strictly a waterproof product. It adheres firmly and tenaciously to any surface, whether glass, marble, tile, brick, concrete, wood, steel, limestone, etc.

Caulk-O-Seal—Non-staining Compound

Caulk-O-Seal is a truly *non-staining* compound. This feature is of extreme importance and we suggest that it be considered carefully. It will not stain the surrounding surface adjacent to the place applied. This is a distinctive feature of our product and worthy of consideration. Many beautiful buildings, of limestone and marble construction principally, have been marred by the use of a compound which exudes liquid. The liquid is required as it is the life of the compound. If it bleeds out, its life is lessened. It will be a revelation

to you to make a few simple tests with Caulk-O-Seal. Samples will be furnished to demonstrate its *non-staining* quality.

Method of Application

The method of application advocated by us is by the use of a hand caulking gun. We furnish a light, powerful gun, easily operated and capable of developing a high pressure. However, Caulk-O-Seal is of the proper consistency and is easily forced to the required depth in an opening. A canvas of caulking contractors proves conclusively that the use of a hand gun saves labor cost and does the work properly, making a smooth, even exterior finish.

Caulk-O-Seal Gun Grade—Knife Grade

Caulk-O-Seal is supplied in Gun Grade (for use with caulking gun) and in Knife Grade (for use with a putty knife or caulking tool.) Made in white, gray, limestone, natural, green, red, maroon and black. Special colors made to order in any quantity. Packed in all sized convenient containers. One gallon of Gun Grade will caulk about 150 lineal feet of an opening, 1/4 in. wide and 1/2 in. deep.

Caulking Around Window and Door Frames

In new construction, it is recommended that the compound be applied between the frame proper and the masonry. When spaces are deeper than 1/2 in., they should be packed within 1/2 in. of the surface with oakum and the remaining space completely filled with Caulk-O-Seal. The staff bead is then put in place.

Pointing Stonework, Terra Cotta, Copings, etc.

All joints should be raked back to a depth of 1/2 in. and filled in with Caulk-O-Seal.

Glazing

For embedding and glazing glass in wood or metal sash or skylights, use the same as putty. Its elasticity prevents glass from breaking due to vibration or contraction and expansion.

Guarantee

Caulk-O-Seal when applied as directed under usual conditions is guaranteed to give five years' service.

References

Many important buildings have been caulked with Caulk-O-Seal, including schools, hospitals, apartment houses, churches, public buildings, hotels, United States Government buildings, and industrial plants.

Contractors approved by us are available in principal cities of the United States.

DEGRACO PAINTS, which include:

Degraco Metal Protective Paints
Sta-White for plant interiors
Degraco Building and House Paints
Degraco Interior Finishes (Decorative)
Degraco Brick and Concrete Paints
Cemtex—galvanized iron primer
Silvr-Cool—aluminum paint
Degraco Enamels
Degraco Machinery Finishes
Silvr-Leaf—aluminum paint
Degraco Industrial Finishes
Degraco Railway Finishes
Anti-Aqua—waterproofing
Degraco Fume Resistive Paint
Degraco Gas Holder Paints

Specifications

Complete data on all products listed above and miscellaneous finishes with specifications are covered in our standard catalogues.

Distribution and Warehouse Stocks

Degraco Paints are sold through branch offices with warehouse stocks in all principal cities.

Metal Protective Paints

Superior Graphite Paint—Manufactured in black, brown, red, olive green and stack black. Superior Graphite Paint has established its reputation as a leader among metal protective paints with service records covering a long period of years.

Brown is generally used as shop coat. For first and second field coats different colors are recommended that complete covering may be secured with each coat.

Prime-Rite—A red lead base paint for priming or shop coat on structural steel and metal. In this paint all the good qualities of red lead are retained and in addition Prime-Rite has certain advantages, such as ease of application, elasticity of film to expand and contract with the steel, resistance to abnormal exposure conditions, fumes, etc.

DEGRACO PAINTS

All Colors for All Purposes

Ornamental Iron Finishes—

For all types of ornamental iron work for interior and exterior exposure. Made in three finishes: eggshell, flat and bower-barff; also gloss black primer.

Metal Paints in Light Colors—Highest quality metal protective paints for finishing steel in light colors. Manufactured in a wide range of colors.

Miscellaneous Metal Paints—This Company produces a complete line of metal protective paints, including in addition to above, Red Oxide Paints, Blue Lead Paints, Asphaltum Paints, Carbon Paint, Lead Chromate Paints, Stack Paints, Fume Resisting Paints, etc., each of which are recommended for certain specific surface and exposure conditions.

Refer our Catalog No. 1 for complete data and specification charts on Metal Protective Paints.

Degraco Aluminum Paints

Degraco Aluminum Paints are supplied in ready mixed form. The high quality of the vehicle insures long life and the high lustre bronze used in their manufacture insures maximum light and heat reflective value. No. 325 Silvr-Cool is recommended for tankage and other structures demanding maximum service requirement. Use No. 555 Silvr-Leaf Aluminum for general work, interior painting, etc. Both materials are used over Degraco Aluminum Undercoater.

Sta-White—For Plant Interiors

Sta-White is a pure white oil paint for industrial interiors. Recommended for interior painting in mills, factories, offices, dairies, public buildings, etc.

It may be used on wood, concrete, plaster, metal, brick, wall board and other surfaces.

Sta-White produces a light reflecting washable finish. It is supplied in gloss, semi-gloss and flat.

Three-coat Work—First and second coats, Sta-White Primer. Finish coat, Sta-White Gloss, Semi-gloss or Flat.

Two-coat Work—The unusual opacity of Sta-White Primer and Finish makes possible a complete solid white job in many instances with two coats. First coat, Sta-White Primer, finish coat Sta-White Gloss, Semi-gloss or flat.

Fume Proof White Enamel

A finish of the same characteristics as Sta-White producing a white enamel washable finish for use in operations where fumes, heat and moisture discolor the average type of white paint. Applied over priming coat of Fume Proof White Primer.

Degraco Building and House Paints

Highest grade building and house paints made in white and wide range of colors. Manufactured from highest grade accepted standard pigments and vehicles by modern and scientific machinery. Recommended for protection of wood and metal in general building construction, for mill and mine villages, etc.

Refer our Catalog No. 3 for detailed data and specifications covering complete line of Building and House Paints.

Decorative Interior Finishes

Degraco-Tone—A velvet finish wall paint for use on plaster, masonry, metal, woodwork and other interior surfaces. It produces a soft velvet finish of unusual beauty and texture.

Foundation coat should be a mixture of three parts Degraco Wall Sealer and one part Degraco-Tone. Follow with two coats of Degraco-Tone.

Stiploid—Washable Wall Finish—A non-porous washable wall paint producing a beautiful job in stipple finish. Highly suitable for use in hospitals, hotels, schools, colleges, public buildings and other institutions where wall paints are subjected to severe usage and frequent washing. Dust, dirt, grease and such defacements as match scratches, ink spots, etc., can be readily removed from Stiploid without destroying its decorative qualities.

Stiploid is supplied in two parts—Stiploid Body, white, and Stiploid Reducer to be mixed and applied in accordance with specifications.

Degraco Flat Wall Paint—A high quality flat wall paint producing a mat finish. For use on plaster, masonry, metal, woodwork and other interior surfaces.

Foundation coat should be a mixture of three parts Degraco Wall Sealer and one part Degraco Flat Wall Paint. Follow with two coats Degraco Flat Wall Paint.

Degraco Wall Enamel—Semi-gloss—A low lustre wall enamel producing a full bodied enamel film but with an absence of glare or high lights. A non-porous washable finish.

Foundation coat, Degraco Wall Enamel Undercoater. Follow with two coats Degraco Wall Enamel tinted to desired shade.

Degraco Wall Enamel may be used on plaster and other interior surfaces. Supplied in white only for ready tinting. When enamel finish in gloss or eggshell

is desired for application in white refer specification covering Sta-White.

Degraco-Lite Enamel—Finest quality white enamel for interior or exterior use. For use on woodwork and other surfaces. Supplied in white for ready tinting on the job. Used over Degraco-Lite Undercoater.

Master Painters Enamel—White enamel of excellent quality for interior use on wood trim and other surfaces. Supplied in white for ready tinting on the job. Used over Master Painters Undercoater.

Degraco Interior Metal Trim—Low lustre enamel finish for interior metal trim on doors, metal sash and casements and other ornamental work. Supplied in ivory, buff, light and dark gray, light brown, mahogany, verdi green, olive green and black. Used over Degraco Flat Metal Primer.

Degraco Floor Enamels—Enamel finish for use on wood and concrete floors producing a protective film that is hard drying, non-porous and washable. Two coats produce an excellent wear resisting finish.

Degracolin—A colorless concrete floor hardener. Its use insures a hard flintlike surface without changing the color or appearance of the concrete floor.

Degraco Radiator Finishes—Supplied in flat and gloss white for ready tinting. For aluminum finish use Silvr-Cool No. 325. For priming coat on radiators use Degraco Flat Metal Primer light or dark depending on color of finish.

Refer our Catalog No. 2 for complete data and specifications on Wall Paints and Decorative Interior Finishes.

Anti-Aqua—Waterproofing

For waterproofing foundation walls below grade. Also highly suitable as a plaster bond and waterproofing for use on the interior surfaces of outside masonry walls that are to be plastered.

Degraco Brick and Concrete Paints

For exterior and interior use on concrete.

Manufactured on a formula to meet the requirements for beautifying and preserving concrete over long periods.

Degraco Paints in General

Degraco Paints are made in all colors for all purposes including many special types of finishes and enamels.

Complete specifications and color cards will be furnished on request.

Special data will also be supplied on Acid Fume Resistive Paints and other special coatings for abnormal exposure conditions.

DIXON'S INDUSTRIAL PAINTS (*Flake Silica-Graphite*). DIXON'S BRIGHT ALUMINUM.

DIXON'S MAINTENANCE FLOOR PAINTS.

The Company

For over one hundred years the business of the JOSEPH DIXON CRUCIBLE COMPANY has followed every ramification of graphite use with every known grade and form of graphite passing through its laboratories.

The company is, therefore, in position to select and use that kind of graphite best suited to any particular purpose. That this selection is made with the utmost care and with due regard to the purpose for which the graphite is intended is evidenced by the high character and quality of Dixon's products generally and the popularity of *Dixon's Paints* in widely diversified fields.

How Dixon Discovered the Value of Flake Graphite As a Paint Pigment

Over sixty-five years ago, alterations in the mining plant of the JOSEPH DIXON CRUCIBLE COMPANY at Ticonderoga, N. Y., resulted in the removal of a large amount of good machinery. As it was necessary to store it out of doors and protect it from rusting, the superintendent started to paint it with a mixture of oxide of iron and linseed oil.

The supply of oxide giving out, he thought to use some of the *flake graphite* which was a product of the plant. Two years after, examination of the surface showed that, though still intact, the oxide of iron paint had become exceedingly dry and brittle, while the *flake graphite* paint had, to a wonderful extent, retained its original toughness and elasticity. *On many of the pieces the paint remained in good condition for twenty-four years.*

We use today precisely the same material used in this trial so long ago, and never have we found any cause to change our views as to its absolute superiority as a protective coating on wood and metal surfaces.

Flake Silica-Graphite is Favored by the United States Department of Commerce

The United States Department of Commerce, Bureau of Mines, in Information Circular No. 6123, May 1929, under caption "Pigments and Paints" commends the use of *flake silica-graphite* as a paint pigment because of its opacity and great resistance to deterioration. This statement literally substantiates the claims made by the JOSEPH DIXON CRUCIBLE COMPANY respecting the wearing and protective qualities of Dixon's Industrial Paints in which the pigment used is *flake silica-graphite*.

DIXON'S INDUSTRIAL PAINTS

(*Flake Silica-Graphite*)

The Physical Properties of a Protective Paint

There are two components in paint—the *pigment* and the *vehicle*. They are of prime importance for upon them depend the life and wearing qualities of the paint.

Linseed Oil Vehicle

Of all paint vehicles linseed oil is recognized as one of the most suitable because of its ability to withstand wear and exposure. When dry, linseed oil adheres strongly to surfaces upon which it is applied, and even when used alone offers a certain amount of protection. However, when so used, the film is thin and soon wears away under the influence of the elements and the abrasive action of dust, cinders, etc.

In order to make the film thicker so as to furnish a greater amount of wear resistance, a pigment is added and its resistance to wear is increased in direct proportion to the thickness of this pigment.

Flake Silica-Graphite as a Paint Pigment

As a paint pigment, graphite is absolutely inert. It is not affected by the action of even the strongest acids or alkalis. It does not undergo any chemical change in use and will not affect the natural resiliency of the oil vehicle.

Natural *flake graphite*, however, needs something to give it further endurance and for that reason we call on the aid of *silica*. The peculiarity of Dixon's Silica-Graphite Paint is that the silica is

mined with the graphite and is largely an integral part of the graphite itself.

Silica is sometimes used as a paint pigment but it has no covering power and is hard, rough and transparent while graphite is soft, unctuous and opaque.

Silica and flake graphite are two most excellent paint pigments possessing in the greatest possible degree those most necessary characteristics—inertness and low specific gravity. But to be perfect, each needs just that amount of improvement which the presence of the other affords.

Nature's mixture of *flake silica-graphite* is obtained from our own mines and affords a most superior paint film as compared with a pigment where silica is mechanically added to the graphite.

Advantages of Using Flake Silica-Graphite Paints

(1) They are easier to apply, the unctuous peculiarity of flake graphite giving an ease of brushing not to be found in other paints.

(2) They are stronger in covering quality, particularly in the darker shades, the tendency of graphite as a paint pigment being toward heavy opacity.

(3) They cover more surface per gallon because of the assistance graphite lends in smoothness, without depreciating the protection of the paint film.

(4) They are more waterproof, graphite having waterproof qualities unsurpassed by any other pigment.

Dixon's Industrial Paints are, therefore, more durable and afford the greatest measure of protection because of the *flake silica-graphite* pigment.

Flat Flakes of Silica-Graphite Overlap Like the Scales of a Fish

Cemented together by a tough elastic "skin" of pure boiled linseed oil, these flakes give to *Dixon's Industrial Paint* a striking resemblance to nature's own best protection against water—the armor of a fish

Where the Use of Dixon's Industrial Paint is Recommended

For finishing outdoor metal and wood surfaces where unusual wear or climatic conditions present a disturbing maintenance problem.

These paints are waterproof in the rigid sense of the word. Changes in temperature do not affect them.

They are strong in covering power and have a spreading capacity of 450 to 500 sq. ft. to the gallon.

As a protective coating for:

Structural steel	Coal tipples
Water conduits	Iron fences
Grain elevators	Lamp posts
Roofs	*Smokestacks
Bridges	Marine work
Boilers	Steel and wood barges
Gas tanks	Condensers
Oil tanks	Transformers
Tank cars	Excavating and hauling machinery
Water tanks	

*As a finish for smokestacks or heated surfaces they are without peer, resisting heat up to 500° F.

Dixon's Red Lead Graphite Primer No. 101

Composed of red lead, *flake silica-graphite*, a high grade oxide of iron and tested boiled linseed oil, it meets the requirements of those inclined toward straight red lead because of its strong adherence to metal and long life.

The unctuous quality of the *flake graphite* prevents "dragging" and destruction of brushes. Because of the nature of its pigment and vehicle, this primer will not become hard and brittle with resultant chipping and scaling, but retains its elasticity. Having a covering capacity of 450 sq. ft. to the gallon it is most economical either from a standpoint of cost per gallon or years of service.

A metal surface finished with a coat of Dixon's Red Lead Graphite Primer No. 101, followed by two coats of Dixon's Industrial Paint (*flake silica-graphite*) will have the best of protection for a period of 9½ years, on the average, without renewal.

Hundreds of testimonials submitted by engineers, chemists, contractors, etc., substantiate this claim.

Dixon's Aluminum Paints

The value of aluminum as a reflective and protective paint, and its ability to lessen evaporation losses is well established.

Its use in oil and gas fields is standard practice. There are, however, many other equally important uses to which this unique paint is adaptable.

Aluminum Graphite—Prepared with the same care as our other *flake silica-graphite* paints, it has established a reputation for quality and durability.

The pigment is *flake aluminum* and *flake silica-graphite*. The similarity of their flake structure permits them to lap over one another like fish scales forming a film of great elasticity and durability. So closely do they overlap that it is impossible for anything to penetrate to the undersurface. The vehicle is a tough marine spar varnish.

Gases, acids, smoke and other deteriorating influences have practically no effect on surfaces protected by Dixon's Aluminum-Graphite and it is also highly resistant to the effects of the elements. Its unusual durability, reflectivity and lower cost per year of service is due to the overlapping of the flakes in a bond of durable spar varnish.

Because of the graphite component, it brushes easily and covers well.

Bright Aluminum—The vehicle used is a tough marine spar varnish giving great resistance to the elements and insuring life and brightness to the *straight aluminum pigment*.

This paint will not dull or take on a brownish cast with the readiness of ordinary aluminum paints nor will its pigment precipitate as rapidly.

SPECIFICATIONS FOR DIXON'S INDUSTRIAL PAINTS (FLAKE SILICA-GRAPHITE)

Foreword

In preparing the following specifications covering the application of Dixon's Industrial Paints we have spared no effort to insure their technical and practical correctness.

Each specification is based on our observation during 65 years in the manufacture of metal protective paints and is placed before the architect and engineer with the assurance that in following any specification herein they may feel fully confident that the results therefrom will be of the most satisfactory nature.

Dixon's Industrial Paints (*flake silica-graphite*) are recognized the world over for their protective value and in specifying them the architect or engineer insures for his client permanency of the steel and iron work.

General Conditions

Materials—All paint materials shall be delivered to the building site in the original unbroken containers bearing the manufacturer's stamp or label thereon.

The top of the container to be removed, and the paint properly stirred before being used.

The use of adulterants at any stage of the work is strictly prohibited, nor shall materials be thinned or changed in any way other than specified.

Workmanship—All materials shall be applied by skilled mechanics. Paint shall be evenly spread and thoroughly brushed out. All workmanship shall be executed in accordance with the best practices.

All surfaces to be painted shall be dry and free from foreign matter, dirt, cement, grease, oil, scale, etc. No paint shall be applied until the preceding coat is thoroughly dry.

*Specification No. 1***Steel Bridges**

Shop Coat—All steel work, including iron and cast steel shall be thoroughly cleaned of all scale, rust, dirt, grease or other foreign particles and shall be given one shop coat of Dixon's Red Lead Graphite Primer No. 101. Where surfaces of riveted work come in contact they shall be painted with the same material before being assembled.

Field Coat—After erection, all damaged surfaces of shop coat, all shop marks, rivets, bolts, etc., shall be touched up with Dixon's Red Lead Graphite Primer No. 101. A first field coat of Dixon's Industrial Paint of approved color, shall then be applied. After the first coat is thoroughly dry, a second field coat shall be applied, a difference in shade to be observed between the first and second field coats to insure proper coverage.

*Specification No. 2***Structural Steel**

Shop Coat—All structural steel work, before leaving the shop shall be cleaned of all scale, rust, dirt, grease or other

foreign particles and shall be given one shop coat of Dixon's Red Lead Graphite Primer No. 101. Where surfaces of riveted work come in contact they shall be painted with the same material before being assembled.

Field Coat—After erection all damaged surfaces of shop coat, all shop marks, rivets, bolts, etc., shall be touched up with Dixon's Red Lead Graphite Primer No. 101, and then all exposed surfaces of the steel work shall be given a coat of Dixon's Black Paint (Alkali Resisting) No. 333.

Miscellaneous—All grillage shall receive one coat of Dixon's Red Lead Graphite Primer No. 101, and one coat of Dixon's Black Paint (Alkali Resisting) No. 333 before setting.

*Specification No. 3***Miscellaneous Iron, Ornamental Iron, Steel Partitions, Steel Windows, Kalamein Work, etc.**

General—Before shop coat is applied, all steel and iron work shall be thoroughly cleaned of all scale, rust, dirt, grease or other foreign particles. Before the field coat is applied all damaged surfaces of shop coat, all shop marks, rivets, bolts, etc., shall be retouched with the same material used for the shop coat, which is to be Dixon's Red Lead Graphite Primer No. 101.

Miscellaneous Iron—All miscellaneous iron work, such as steel lintels, steel bucks, anchors, brackets, etc., shall receive one shop coat of Dixon's Red Lead Graphite Primer No. 101, and one field coat of Dixon's Standard Oxide Red No. 114.

Note: All exposed miscellaneous iron, such as window lintels, etc., shall receive an additional coat of lead and oil paint as specified under "Painting."

Ornamental Iron—All ornamental iron, such as railings, fencing, window grilles, flagpoles, etc., shall receive one shop coat of Dixon's Red Lead Graphite Primer No. 101, and one field coat of Dixon's Standard Oxide Red No. 114. The final coat shall be Dixon's Industrial Paint of approved color.

Note: When colors to harmonize with surrounding woodwork, etc., are desired, the final coat should be lead and oil paint as specified under "Painting."

Steel Partitions—Steel partitions, such as metal toilet partitions, etc., shall receive one shop coat of Dixon's Red Lead Graphite Primer No. 101, and two coats of Dixon's Olive Green No. 110.

Steel Windows—Steel windows shall receive one shop coat of Dixon's Red Lead Graphite Primer No. 101, and one shop coat of Dixon's Standard Oxide Red No. 114. The final coat shall be lead and oil paint as specified under "Painting."

Kalamein Work—All kalamein work shall receive one shop coat of Dixon's Red Lead Graphite Primer No. 101. The final coats shall be applied as specified under "Painting."

*Specification No. 4***Dixon's Bright Aluminum for Walls, etc.**

Note: Dixon's Bright Aluminum No. 113 is highly recommended for the interiors of workrooms and industrial buildings because of its light reflecting qualities. It does not tarnish, is not affected by sulphurous gases and can be washed with soap and water.

Priming Coat—All plaster surfaces of walls, columns and ceilings shall receive a coat of primer having lime resisting qualities. It shall be applied in accordance with the printed instructions.

Florianapolis Bridge, S. A. (4,400 Tons of Steel)

Newark Bay Bridge, C.R.R. of N. J., Newark, N. J.

tions of the manufacturer and shall not be recoated until it has dried hard and absolutely free from tack.

All metal surfaces shall be primed with Dixon's Red Lead Graphite Primer No. 101.

Aluminum Coat—All plastered surfaces of walls, columns and ceilings and all wood and metal trim and doors shall be painted with two coats of Dixon's Bright Aluminum No. 113.

Specification No. 5

Water Tanks, Smokestacks, Gas Holders, Power Plant Equipment, etc.

Shop Coat—All steel work, including cast iron and cast steel, shall be thoroughly cleaned of scale, rust, dirt, grease or other foreign particles and shall be given one shop coat of Dixon's Red Lead Graphite Primer No. 101. Where surfaces of riveted work come in contact they shall be painted with the same material before being assembled.

Field Coat—After erection, all damaged surfaces of shop coat, all shop marks, rivets, bolts, etc., shall be touched up with Dixon's Red Lead Graphite Primer No. 101. A first field coat of Dixon's Industrial Paint of approved color shall then be applied. After the first coat is thoroughly dry, a second field coat shall be applied, a difference in shade to be observed between the first and second field coats to insure proper coverage.

Note: For smokestacks and other heated surfaces we recommend Dixon's Black No. 108, or Dixon's Natural No. 107. Both paints will withstand heat up to 500° F. In repaint work two coats are required for best results, and on new work, three coats, including the priming coat (Dixon's Red Lead Graphite Primer No. 101).

Specification No. 6

Wire Work

All uncoated wire work, including frames, fixtures, etc., shall receive one coat of Dixon's Red Lead Graphite Primer

No. 101, and two coats of Dixon's Bright Aluminum No. 113.

All galvanized iron wire work shall receive one coat of galvanized iron primer and two coats of Dixon's Bright Aluminum No. 113.

Specification No. 7

Maintenance Painting

Cleaning—All broken or blistered paint, all rust, grease and dirt, must be removed by wire brushes, scrapers, blow-torch, or by sandblasting with fine sand. The method to be selected and made part of the contract.

Repainting—All surfaces shall be given two coats of Dixon's Industrial Paint of approved color. The second coat to be applied when the first is thoroughly dry and to be slightly different in color to insure proper coverage. Surfaces must be perfectly dry when painted.

For Roofs—*Note:* The same qualities which make Dixon's Industrial Paints so efficient for other exposed surfaces account for its great protection to roofs—a practically inert pigment and a linseed oil vehicle. We recommend three coats for new metal roofs—the first coat to be Dixon's Red Lead Graphite Primer No. 101 followed by two coats of Dixon's Industrial Paint. On previously painted metal roofs, two coats of Dixon's Industrial Paint is ordinarily sufficient. This paint is also suitable for canvas and shingle roofs. Where shingles are dry, they should receive a coat of oil, otherwise they will quickly absorb oil from the paint, leaving the pigment without sufficient binding material. Use Dixon's Light or Dark Green for beautifying effect or Dixon's Natural Color for slate effect.

Galvanized Iron or Tin Roofing—Before Dixon's Industrial Paint is applied to a new roof, it should be washed clean of oil, etc., with a solution of sal-soda. When dry, a first coat of Dixon's Red Lead Graphite Primer No. 101 should be applied followed by a second and third coat of Dixon's Industrial Paint of approved color.

DIXON'S MAINTENANCE FLOOR PAINTS

All-purpose Floor Coatings

Dixon's Maintenance Floor Paints are all-purpose coatings for use on floors of

Concrete	Linoleum
Composition	Wood

They are designed to give the maximum of durability, the special vehicle used being properly balanced to give this result.

These paints are solid covering and heavy bodied so that a satisfactory finished job can be had in a two-coat operation.

For use in factories, garages, hotels, public buildings, steamships, hospitals, laboratories, railway cars and every place where a protective durable floor coating is required.

For Inside or Outside Use

Dixon's Maintenance Floor Paints may be used inside or out and are particularly adapted to withstand the rigorous action of climatic changes, sleet, rain and salt water to a remarkable degree.

Because of their "all-purpose" characteristics, Dixon's Maintenance Floor Paints have met the rigid standards of the marine trade which may be taken as an indication of their superior quality. They have also found unqualified acceptance in the industrial and railroad fields where service conditions are, as a rule, particularly severe.

Prevent "Dusting" of Cement Floors

Dixon's Maintenance Floor Paints withstand the disintegrating action of the alkali in cement and concrete and effectually prevent "dusting." They are not affected by hot, cold, fresh, salt or soapy waters, oil, alkali or dirt, and will give service over a long period despite hard weather and extraordinary wear.

These paints dry in six to eight hours thereby facilitating the work which heretofore has been subject to irritating delays.

Colors

Dixon's Maintenance Floor Paints are made in eight conventional colors:

Mahogany Red	Special Tan
Dark Red	Dustproof
Light Gray	Standard Green
Rich Brown	Oak

Specifications

[All cement floors, steps, platforms and wall bases] [All composition floors, steps, platforms and wall bases] [All wood floors] shall receive two coats of Dixon's Maintenance Floor Paint, color selected.

All surfaces to be painted shall be thoroughly cleaned before the paint is applied.

To insure satisfactory performance, Dixon's Maintenance Floor Paint shall not be applied to cement surfaces until at least three months after installation.

A FEW OF THE MANY NOTABLE STRUCTURES IN WHICH DIXON'S INDUSTRIAL PAINTS WERE SPECIFIED AND USED

Thousands of tons of steel are in these buildings and hundreds of barrels of Dixon's Industrial Paint were used to assure the steel frameworks that "ounce of prevention" against rust and corrosion.

Architects, engineers and contractors are unanimous

in their approval of this method of safeguarding and lengthening the life of steel framework.

Dixon's Industrial Paint has made records for long protection service on all types of structures and is universally recognized as being low in cost per year of service.

Forty-two Years of Paint Engineering Service

Goheen Paint Engineers have, since 1888, perfected a series of scientific, specific purpose paints, to meet the special requirements of architects, engineers, large industrials, public utilities, railroads and mining interests for every exterior and interior surface.

When you specify Goheen Paints, you are assured of quality plus engineering service, controlled by experts from the raw material to the finished product.

Britenol Interior White

A superior mill white designed specifically for interiors of industrial plants, textile mills, paper mills, power plants, food product plants, dairies, laundries, bakeries and offices. Will remain white under practical industrial conditions, and possesses the highest light reflecting qualities.

It stays where it is put—on walls or ceilings, and will not crack, peel or flake off under vibration. Has great hiding power, giving first class results with a single coat in many cases. It is used on concrete, brick, plaster, wood, or steel and the finished surface is smooth, dustfree and washable as an enamel.

Supplied for spray application as well as brush. Made in flat, eggshell, or gloss finish. Special shades available for dado work.

Britenol Fume Proof White

Standard industrial Britenol is mildly acid and fumeproof. For severe acid, gas, fume or moisture conditions, Britenol Fume Proof White should be used.

Carbonizing Coating

An inhibitive and protective coating for iron and steel, including structural steel, steel buildings, steel sash, fire escapes, bridges, transmission towers, tanks, standpipes, gas holders, penstocks, pipe lines, condensers, turbines, etc. Will give seven to ten years exterior service under normal conditions, and has lasted as long as fifteen years.

Made in a variety of standard shades and in special colors to order.

Highway Red

A chemically combined red lead paint, mixed ready for application, possessing all advantages of hand mixed red lead with disadvantages eliminated. Eliminates any whitening or non-uniformity of film. Remains in suspension without any tendency to settle or harden in package.

Made in two shades—No. 22 Red Lead shade and No. 21 Standard shade.

Galvanum

A special paint for the protection of galvanized iron. Galvanum adheres to new galvanized iron without priming, acid washing or weathering. It is applied directly to the bare metal without any preliminary treatment whatsoever. Is equally successful on galvanized iron which has previously been painted. Lasts from five to seven years, often from ten to fifteen years. Made in a variety of standard shades and in special colors to order.

**New St. George Hotel, Brooklyn, N. Y.**

EMERY ROTH, Architect
BING & BING, General Contractors
Goheen Paints were used on the new addition to this hotel, which is the largest in Greater New York

Concrewaltum Floor Enamel

Produces a hard, elastic, durable and beautiful enamel finish on concrete floors. Prevents absorption of oils and greases and gives a surface easy to clean and to keep sanitary.

Made in a wide range of colors and in special shades to order.

TNEMEC PAINT & OIL COMPANY

Manufacturers of Tnemec (Patent Cement Pigment Products)

KANSAS CITY, MO.

BRANCH OFFICE: 205 West Wacker Drive, CHICAGO, ILL.

Tnemec Is Carried in Stock by Distributors in Over 125 Cities in the U. S. A.

Write This Company for Name of Nearest Distributor

Products

TNEMEC INDUSTRIAL COATINGS in large variety of colors, designed especially for iron and steel, galvanized iron, concrete walls, brick and stucco walls. Approved by Investigating Committees of Architects and Engineers, New York City.

TNEMEC FLOOR COATINGS, for cement and wood floors, shelves and other surfaces where a hard, abrasion resisting durable high gloss finish is desired. Made in attractive colors.

TNEMEC HOUSE COATINGS for outdoor woodwork, made in wide variety of shades and have unusual hiding power. The white cement pigment plus auxiliary pigments used in these coatings give increased durability.

TNEMEC FLAT WALL COATINGS for plastered walls in homes, offices, schools and public buildings. Made in wide variety of shades. Have unusual hiding power. The white cement pigment plus auxiliary pigments used in these coatings give increased durability. Can be washed with soap and water repeatedly without injury.

TNEMEC MILL WHITES (gloss, eggshell and flat) for factories and interior walls of buildings. Increases lighting efficiency.

TNEMEC TRAFFIC ZONE COATINGS for marking traffic lanes, curbing, etc. of streets, in garages, around filling stations, etc.

Tnemec (Cement Written Backward)—What It Is

A patented product, consisting of portland cement re-ground to exceeding fineness, as pigment, with kettle-boiled linseed oil as vehicle, plus only enough tinting color to produce desired shades. The cement, by a process fully covered by patents, is held in suspension in vehicle, and does not settle on bottom of container. The linseed oil has been kettle-boiled and so processed that it is neutral to the portland cement pigment.

Tnemec is applied by brush or spraying, and handles like any high grade linseed oil paint. Sealed ready to use in 1, 5 and 55-gal. steel containers.

Tnemec has been investigated and approved by Investigating Committees of Architects and Engineers, New York, N. Y.

Weatherproofing and Decorating Concrete, Brick and Stucco Walls

Tnemec dries in 6 to 8 hours, gives the surface a soft, dull, satinlike texture, provides a tough, water repellant film which weatherproofs the surface of concrete, brick, stone and stucco and protects it against checking, cracking and disintegration. Because of the portland cement pigment and because the vehicle of Tnemec has been made neutral to that pigment combined with it, Tnemec is the ideal coating for such surfaces. Tnemec makes a positive part of the surface itself.

Specifications—Preparation of Surface—All surfaces shall be absolutely dry. All dust, dirt and loose material shall be brushed from surface. If concrete and stucco surfaces are less than 60 days old at time painting is to be done, such surfaces shall be given a wash consisting of 3 lb. zinc sulphate to the gallon of water. After this application, surface shall be allowed to dry for 24 hours, then dusted with bristle brush, before application of paint.

First Coat Work—Select color and formula number, as shown below. If applied by brush, stipple thoroughly into all cracks and pores. Thinning with turpentine to insure penetration is permitted, but printed instructions regarding this must be adhered to.

Finish Coat—Use same color as used for primer.

Note: Mention both formula number and color of Tnemec.

No. 3 Pearl gray	No. 21 Cherry red	No. 30 Indian red
No. 6 Brick red	No. 24 Light gray	No. 43 Pea green
No. 7 Nile green	No. 25 White	No. 44 Cream
No. 16 Slate	No. 26 Buff	No. 0131 Sugar house gray
No. 20 Silver gray	No. 29 French gray	No. 0188 Tan

Note: We match any desired color.

Protecting Steel from Corrosion

The rust preventive ability of portland cement is well known. In Tnemec this feature is utilized to the fullest extent

by combining the portland cement as a pigment with the kettle-boiled linseed oil to provide an exceptionally tough, long wearing, waterproof protective coating for structural steel. Tnemec will absorb incipient rust and stop the rusting action, and because of its composition does not crack or blister even under sudden temperature changes. Where Tnemec coated surfaces have been abraded, rust forming on the exposed metal will not creep back under the coating.

Specifications—Preparation of Surface—The steel surface to be painted shall be thoroughly clean and dry. Rust, mill scale, loose paint, dirt or other foreign matter shall be removed by wire brushing, scraping or sandblasting. Oil and grease shall be cleaned off with gasoline. No painting shall be done in wet weather or when there is frost on the steel. No adulterating oils shall be used as thinners—turpentine only and as authorized by manufacturer of Tnemec.

Shop Coat—Use No. 6 Red Tnemec as shop coat before assembling on surfaces which are to be riveted together at the shop. Then one complete coat of No. 6 Red Tnemec shall be applied over all surfaces.

Field Coats—Abrasions in shop coat shall be touched up with No. 6 Red Tnemec before application of field coats. Steel work, after erection, shall be given an evenly applied coat (or two if specified) of Tnemec. Select color and formula number from following list:

No. 3 Pearl gray	No. 20 Silver gray	No. 30 Indian red
No. 4 Battleship gray	No. 21 Cherry red	No. 43 Pea green
No. 5 Semi-gloss black	No. 24 Light gray	No. 44 Cream
No. 6 Brick red	No. 25 White	No. 0131 Sugar house gray
No. 7 Nile green	No. 26 Buff	No. 0150 Orange
No. 16 Slate	No. 29 French gray	No. 0188 Tan

Galvanized Iron Coatings

Painting of galvanized iron, especially new galvanized iron, presents a problem. Ordinary paints tend to crack and peel after a short time. Tnemec has proven to be an outstandingly useful paint on galvanized iron. The portland cement pigment enables it to bond firmly to the galvanized iron when being brushed on. Tnemec, because of its remarkable rust absorbing qualities, absorbs any rust that may have already broken through the galvanized coating, and because of its composition, prevents cracking or blistering of the coating under sudden changes in temperature.

Brushing the first coat on rather than spraying it, insures a firm bond with the galvanized surface.

Specifications—Specify one of Tnemec formulae with colors as shown for painting of steel surfaces.

Cement Floor Protection and Decoration

Tnemec Floor Coatings form a very hard, tough, glossy, wear-resisting surface, that withstands abrasion exceptionally well, even under severe usage. Tnemec Floor Coatings dry dustproof in 2 hours and may be walked on in 6 hours. We recommend 8 to 10 hours where conditions permit.

Specifications—Preparation of Surface—Cement floors must be dry and clean. Dust and dirt shall be removed. Oil and grease shall be scrubbed out thoroughly with high test gasoline and floor wiped dry immediately afterward.

First Coat Work—Specify color and formula number of Tnemec as shown below:

No. 32 Olive green	No. 27 Medium gray	No. 33 Olive gray (dust color)
No. 28 Maroon	No. 35 Tan	No. 34 Venetian red

First coat shall be thinned with turpentine sufficiently that paint may flow on freely and penetrate surface pores and crevices readily.

Finish Coat—Shall be applied not less than 8 hours after first coating. Second coating may be thinned slightly with pure turpentine, just enough to facilitate brushing.

General Information

Complete catalogue of Tnemec Coatings and their uses, sent on request.

ALUMINUM COMPANY OF AMERICA

Manufacturers of "Alcoa Albron" for Aluminum Paint

PITTSBURGH, PA.

For our pages on Aluminum and its Alloys, and Roofing, see Manufacturers' Index

Alcoa Albron Aluminum Bronze Powder for Paint

Growth of the Use of Aluminum Paint in the Architectural and Engineering Fields—The durability, highly protective and light-reflecting qualities of Aluminum Paint on wooden, brick, concrete, and structural steel surfaces have become widely known and generally appreciated by architects and engineers.

Aluminum Paint consists of a suitable vehicle and a pigment of aluminum bronze powder. To be sure of obtaining a pure aluminum bronze powder of the highest grade and free from mica and other adulterants, specify Alcoa Albron, made only by ALUMINUM COMPANY OF AMERICA.

The Unique Characteristic of "Leafing" Gives Aluminum Paint Superior Durability and Protective Qualities—Used with the proper vehicle, the tiny flat flakes of Alcoa Aluminum, of which Alcoa Albron is composed, rise to the surface of the paint film and "leaf," forming a continuous coat of metal protection. This metallic coat protects the underlying film as well as the surface covered by the paint. Being opaque to ultra-violet as well as to visible light rays, these Alcoa Albron flakes prevent the paint-destroying ultra-violet rays from reaching the body of the film. Thus, Aluminum Paint is provided with extra durability. This leafing action does not take place with ordinary paint pigments which are in the form of granules instead of tiny flat flakes like Alcoa Albron.

Aluminum Paint has proven itself in actual service to be a superior paint for protecting all outside structures. For not only is it opaque, but it is also highly resistant to moisture penetration. The United States Forest Products Laboratory has shown that Aluminum Paint on wood has a moisture-proofing efficiency higher than any other oil base paint. It is especially recommended as a primer for wooden surfaces to be followed by additional coats of Aluminum Paint, or other paints if desired. Its light and heat-reflecting qualities make it valuable for protecting oil storage tanks and other structures that are exposed to sunlight and which it is desired to keep as cool as possible.

Hiding and Covering Properties of Aluminum Paint—Because of the "leafing" of aluminum flakes and their opacity, the paint has great hiding properties. Even on very dark surfaces, one coat will ordinarily provide complete hiding and give a surface of good appearance. Two or more coats are recommended for surfaces exposed to the weather and where long life is required. Under favorable conditions, 1 gal. of Aluminum Paint will cover as high as 500 sq. ft. of smooth surface.

Light-reflecting Qualities of Aluminum Paint—Aluminum Paint is especially recommended for interiors of factories and industrial buildings because of its light-reflecting quality. A well-made Aluminum Paint will reflect 60% to 70% of the light falling upon it and will maintain a high reflectivity over a long period of time. It is easily kept clean and will withstand repeated washings. Sulfur and sulfurous gases do not darken Aluminum Paint.

Where Obtained—ALUMINUM COMPANY OF AMERICA does not sell paint. But Aluminum Paint made with satisfactory vehicles and Alcoa Albron Powder may be purchased from most reputable paint manufacturers, jobbers and dealers. Be sure the pigment portion is Alcoa Albron and is so designated. If for any reason you can not obtain such a paint, advise ALUMINUM COMPANY OF AMERICA and we will be glad to direct you to the nearest Aluminum Paint dealer.

Process of Making Alcoa Albron—Alcoa Albron is made by stamping pure Alcoa Aluminum into very small thin flat flakes, which are carefully sized by sieves to give a uniform product. This is followed by a special polishing process which gives the flakes their high luster.

Importance of the Vehicle—The type of vehicle influences the lasting and working qualities of Aluminum Paint. Spar varnish or long oil varnishes and kettle bodied linseed oil combined with drier and thinner are good vehicles for Alcoa Albron. The use to which the paint is put determines the character of the vehicle to be used.

For painting wood, most paint manufacturers prepare special kettle bodied linseed oil vehicles or very long oil varnishes; for painting other kinds of surfaces, including metal, long oil varnish is commonly recommended as the vehicle. There are a variety of high quality vehicles made by different manufacturers especially for use with Alcoa Albron.

Architects' and Contractors' Specifications

Application—Before any paint is applied, the surface shall be thoroughly clean and dry, and all loose paint or scale shall be removed. No exterior painting shall be done in wet or freezing weather. Each coat of paint shall be allowed to dry for at least 48 hours before a succeeding coat is applied.

Aluminum Paint may be applied either by brushing or spraying. If spraying equipment is employed, the usual precautions shall be exercised. In applying Aluminum Paint with a brush, care shall be taken that all of the final strokes are made in the same direction in order that the particles of powder may "leaf" uniformly in the paint film.

Painting Steel Outdoors—Old Work—After thorough cleaning to remove all loose paint or rust, all bare spots shall be painted with a good primer. Two coats of Aluminum Paint made with a long oil varnish and Alcoa Albron, as specified hereinafter, shall be applied over the old paint.

Painting Steel Outdoors—New Work—New steel shall be free from rust before any paint is applied. A rust inhibitive priming coat of good quality shall first be applied. Two coats of Aluminum Paint made with a long oil varnish and Alcoa Albron, as specified hereinafter, shall be applied over the priming coat. Where unusual exposure conditions are encountered, three coats are recommended.

Painting Wood Outdoors—Wooden surfaces which are to be painted shall be dry and free from dust or old loose paint before any paint is applied. The paint to be used on wood shall consist of Alcoa Albron mixed with a kettle bodied linseed oil vehicle, as specified hereinafter, or a very long oil varnish in the proportion of 2 lb. of Alcoa Albron per gallon of vehicle. Three coats shall be applied to new exterior work, and the composition of the paint shall be the same for all three coats, except in the case of open grained lumber or badly weathered wood. In this case, the priming coat shall contain 1½ lb. of Alcoa Albron per gallon of kettle bodied linseed oil vehicle. In the case of old work, two coats of Aluminum Paint shall be used in all cases of exterior exposure.

Painting Brick, Concrete, and Plaster—The Aluminum Paint for this class of work shall consist of Alcoa Albron mixed with a long oil varnish vehicle of the spar type, as specified. The surface shall be free from all loose dust, plaster, and calcimine, and shall be dry. For outdoor exposure, at least two coats of Aluminum Paint shall be used. In case the surface to be painted is extremely porous, the amount of Alcoa Albron per gallon of vehicle shall be reduced to about 1¼ lb. per gallon for the first coat. For interior work of this character, one coat will usually suffice, but in case the surface is of a porous nature, the instructions for exterior painting shall be followed.

Interior Work—For ordinary interior work one coat of Aluminum Paint may suffice. The liquid portion of the paint shall consist of any high grade interior varnish of the consistency hereinafter described. The work shall be carried on in the same manner as for exterior work.

For interior steel work where unusual exposure conditions exist, such as acid fumes, high humidity, etc., the method of application outlined for painting steel outdoors shall be followed. Wooden surfaces under such conditions shall be given at least two coats of Aluminum Paint as specified.

Painting Metal Surfaces to Be Heated—For metal surfaces which reach high temperatures, well-diluted spar varnish may be used. A roughened surface will improve the adherence of the aluminum paint. The paint shall be applied to the cold, clean surface and allowed to dry thoroughly before heating. Special vehicles in the nature of gloss oil have also been commercially developed for use on heated metal and have proved remarkably successful, even at temperatures as high as 700° to 900° F., where not simultaneously exposed to the weather.

Pigment—Aluminum Bronze Powder—The pigment portion of the paint shall consist of Standard Varnish Alcoa Albron, manufactured by ALUMINUM COMPANY OF AMERICA.

Vehicle—Exterior Long Oil Varnish Vehicle—The vehicle for use with Alcoa Albron may be a long oil varnish. The varnish for exterior use shall fulfill the following requirements:

The varnish shall contain not less than 50% by weight of non-volatile oils and gums.

The varnish shall pass a 60% kauri reduction test, as described in Federal Board Standard Specification No. 18.

The varnish shall be of such consistency that when thoroughly mixed with Alcoa Albron in the proportion of 2 lb. per gallon of vehicle, the paint shall show satisfactory spreading qualities, and shall not run or sag when applied to a smooth vertical surface. This consistency will be between 0.5 and 1.0 poise and will correspond to tubes A to D of the Gardner Holdt Air Bubble Viscometer.

The paint shall set to touch in not less than two, or more than six hours, and dry hard and tough in not more than twenty-four hours.

Kettle Bodied Linseed Oil Vehicle—A vehicle specially suited for exterior application on wood is made from linseed oil, bodied by heat alone, and known to the trade as a "kettle bodied" linseed oil. It shall contain the necessary amounts of thinner and drier as received from the maker.

The kettle bodied linseed oil vehicle shall contain not less than 60% by weight of non-volatile oil and driers.

This vehicle shall be of such consistency that when thoroughly mixed with Alcoa Albron in the proportion of 2 lb. per gallon, the resulting paint shall show satisfactory spreading qualities and shall not run or sag when applied to a smooth vertical surface. This consistency will be between 0.5 and 1.0 poise and will correspond to tubes A to D of the Gardner Holdt Air Bubble Viscometer.

The paint shall set to touch in not less than six, or more than ten hours, and dry hard in not more than thirty hours.

Mixing the Paint—Aluminum Paint shall be mixed on the job and only enough for one day's use shall be mixed at one time. The paint shall be mixed in the proportion of 2 lb. of Alcoa Albron per gallon of vehicle, unless otherwise specified. This makes a paint containing approximately 21% pigment and 79% vehicle. The weighed amount of powder shall be placed in a suitable mixing container and the measured volume of vehicle then poured over it. Alcoa Albron shall be incorporated in the paint by stirring with a paddle. Alcoa Albron will readily disperse in the vehicle. Before removing any paint from the mixing container, the paint shall be thoroughly stirred to insure a uniform mixture and the paint shall be suitably stirred during use. A number of paint manufacturers are prepared to supply Alcoa Albron and a suitable vehicle in double containers in exactly the right proportions for mixing.

THE AMERICAN CRAYON COMPANY

Manufacturers of "Permatite"—A Penetrating Varnish
(An "Old Faithful" Product)

SANDUSKY, OHIO

BRANCH OFFICES

NEW YORK, N. Y., 130 West 42nd Street

DALLAS, TEX., Santa Fe Building

SAN FRANCISCO, CALIF., 116 New Montgomery Street

Products

"PERMATITE"—the modern wood sealer and finish.

Also manufacturers of "Nolatite"—linoleum sealer and finish; "Trazatite"—terrazzo sealer and finish, and "Filtite"—cement sealer and finish.

"Permatite"

The following specifications are used by the Navy Department and the Supervising Architect of the United States Treasury:

"Varnish for wood floors and for interior wood finish shall be a penetrating varnish with China wood oil base and free from wax. It shall completely seal the pores of the wood against moisture, grease, oils, etc., and exclude all dust and dirt. It shall produce a finish similar in appearance to a waxed and polished surface without leaving a film on the surface. It shall have a record of successful use for a period of at least four years."

"Permatite" is made to meet each and all of these requirements. It is the original and only emulsified penetrating varnish free from wax that dries bone dry and which may be polished by friction, or that has a record of successful use for a period of seven years.

The remarkable quality possessed by "Permatite" of bringing out the full beauty of the grain and the fact that it need never be refinished, but can be repolished with one application of "Permatite" as often as wear requires, are some of the reasons for its universal acceptance.

"Permatite" Qualities

Because of its fire resisting qualities, its ability to withstand hard usage, the ease with which it may be maintained or repaired, and being non-slippery, it finds favor for schools, public buildings, apartment houses and stores, as well as for the finest residences.

"Permatite" has real value as an under or back coating for it has great resistance to moisture—in fact, four times that of an equal number of coats of linseed oil.

Home of the Late James J. Hill, St. Paul, Minn.

Floors of the first story were all "Permatited" in 1928. The rosewood, teak, mahogany, walnut and maple used for trim and floors of this building make it one of the finest finished in the Northwest.

This building is now used for a Training School for Teachers of the Catholic Diocese of St. Paul, Minn.

"Permatite" will not show laps. It produces a finish which is most easily cleaned—fine steel wool removes spots and all surface accumulations leaving the finish in its original condition, uninjured.

Cost of Application

For the reason that the use of "Permatite" either colored or uncolored, does away with the necessity of a stain coat and of a shellac coat, and for the added reason of its economy of application, the cost of finishing with "Permatite" is less than for a first-class job finished in any other way.

Covering Capacity—"Permatite" spreads on average conditions 300 sq. ft. per gallon, with 3 applications.

A filler may be added to the "Permatite" for the first application.

Maintenance

"Permatited" floors are easily maintained. Ordinary surface accumulations may be removed with a stiff broom and an occasional mopping with a dustless mop. After mopping, again use the broom.

When rough spots appear in traffic lanes, buff the spots with No. 1 steel wool until the wood is smooth and then apply "PERMATITE" as a polish with a cloth.

Specifications

For Woodwork or Floors—There shall be applied in strict accordance with the manufacturer's directions, three full applications of "Permatite," made by THE AMERICAN CRAYON COMPANY, Sandusky, Ohio. Color shall be as directed by the owner or architect. Before proceeding with the work, the contractor shall present to the architect, and have approved, a finished sample of the color and kind of work he proposes to reproduce.

For Back Coating—All unexposed woodwork, including back and sides of standing trim, both exterior and interior, and the underside ends and sides of all flooring, before erection, are to be given a full and undiluted coat of "Permatite," made by THE AMERICAN CRAYON COMPANY, Sandusky, Ohio.

Some Buildings Finished with "Permatite"

Senior High School, Fort Smith, Ark.
Liberty Loan Building, Washington, D. C.
Illinois Bell Telephone Co., Maryland Avenue Branch Office, Chicago, Ill.
Illinois Bell Telephone Co., Sunnyside Avenue Branch Office, Chicago, Ill.
Davis Department Store, Rug Department (showroom floor), Chicago, Ill.
Sacred Heart Home for Aged, Hyattsville, Md.
Cadillac Athletic Club, Detroit, Mich.
Sarah W. Fisher Children's Home, Detroit, Mich.
Medford High School, Medford, Mass.
Cretin High School, St. Paul, Minn.
Kent State Normal College, Kent, Ohio
Ohio State Reformatory, Mansfield, Ohio
Ohio State Soldiers' and Sailors' Home, Sandusky, Ohio
Lookout Mountain Hotel, Lookout Mountain, Tenn.
Dallas Athletic Club, Dallas, Tex.
Library Building, Huntsville, Tex.
Central State Teacher's College, Stevens Point, Wis.

And hundreds of others given upon request.

BONDED MATERIALS CO.

INCORPORATED

OFFICES AND PLANT

421 West Avery Street, LOUISVILLE, KY.

Products

B.M.C. SPECIFICATION BUILT-UP ROOFS.

BITUMOTILE—a super-waterproofing and roofing material.

FLASHINE—a high grade plastic cement.

VITROMASTIC—a cement for applying non-porous materials.

WOODMASTIC—a plastic cement for laying parquetry floors.

BITUMOTILE SATURATE—a waterproofing material to be used with Vitromastic and Woodmastic Cement.

GILASFO—an industrial paint for many purposes.

SILVER SHEEN—a ready-mixed heat resisting aluminum paint.

B.M.C. Specification Built-up Roofs

B.M.C. Specification Built-up Roofs are guaranteed for 25, 20, 15 and 10 years respectively and are applied by reputable roofing contractors appointed by this company. This roof is a cold process of application as it is not necessary to heat any of the materials used. It retains its elasticity and is neither affected by heat, cold or acid fumes. In the method of application under these specifications, waterproofing materials are retained between reinforcing members in such a way that they are able to float, providing for expansion and contraction.

Bitumotile

Bitumotile is a guaranteed roof roating which is applied cold and is used by maintenance engineers who have found in it a material which solves their roofing problems because of its long life and sealing qualities. It is also recommended for waterproofing foundations. The material is easily applied and the cost is very low. Owners of industrial plants, commercial buildings and dwellings will find it a satisfactory material for this purpose. Consult us when you have an unusual waterproofing problem.

Flashine

Flashine is a plastic cement made of similar materials to Bitumotile, but of a thicker consistency, and is used for flashing, copings, deep cracks, etc., and when used in combination with Bitumotile it is ideal for waterproofing problems.

Vitromastic

Vitromastic is a peculiar material of putty consistency, having fine adhering tentacles, for use in construction of Vitrolite, Sani-onyx or in cases where a cement for applying glass or other non-porous products is required. Vitromastic is waterproof and retains its elasticity and stick-to-itiveness.

Woodmastic

Woodmastic—a waterproofing and quick setting plastic cement for use in laying parquetry floors over concrete. Applied cold.

Bitumotile Saturate

Bitumotile Saturate is a waterproofing material to be applied before the finished construction. It is to be used in connection with Vitromastic and Woodmastic as it forms the proper affinity with these products.

Gilasfo

Gilasfo is made from an inert pigment in a vehicle of treated oils which makes it acid, alkali and heat resisting as well as waterproof. It may be applied with either brush or spray gun. No priming coat is required and under ordinary conditions a single application is sufficient to seal any surface—metal, wood or concrete. For all maintenance work there is no better product than Gilasfo.

Coverage—Gilasfo will cover approximately 350 to 400 sq. ft. per gal., and from 250 to 300 sq. ft. with spray gun, depending upon the condition of the surfaces painted.

Colors—Standard Gilasfo is black. Colors can be furnished on special order.

Silver Sheen

Silver Sheen is a unique protective covering. It is an aluminum ready-mixed product with a vehicle that prevents corrosion, and is also highly penetrative and sealing. Silver Sheen is not only moistureproof, but it will not crack, craze, peel, blister or discolor when subjected to high heats or extreme cold temperatures as high as 1000° F. above zero, and as low as 100° F. below zero. Silver Sheen can be applied with either brush or spray gun, over any surface—metal, wood or concrete, and without the use of a priming coat. *One coat* is sufficient for any application.

Coverage—Silver Sheen has a coverage of approximately 550 to 600 sq. ft. per gal., over metal or wood; approximately 250 to 300 sq. ft. per gal. when applied to brick or concrete. These coverages are for brush application. The coverage is slightly lower when applied with spray gun.

Drying Time—Silver Sheen in the standard product requires from 12 to 18 hours drying time, depending upon weather conditions, and its application to interior or exterior surfaces. A Special Silver Sheen can be furnished where a quicker drying finish is desired.

Uses—Silver Sheen is a product of unlimited uses, and can and should be used in all maintenance work where a high quality protective coating is required to meet conditions of corrosion, moisture or heat. Silver Sheen, as its name implies, has an extremely high light reflectivity and retains this property indefinitely. This property makes it the most desired material to use for maintenance of inside structures, passages, light shafts, etc. It is excellent for use in the maintenance of all types of tanks, towers; for fences, poles, fire escapes, machinery of all kinds, and any and all uses where a bright lasting finish and efficient protection of the surface is desired.

Heat Deflection—The heat deflecting property of this product can be used to advantage in painting the roofs of buildings, tanks, etc., which will materially reduce the internal temperatures. Recent tests show a difference in temperature as high as 13° under metal roofs, where a top coat of Silver Sheen was applied.

Priming and Backpainting—Silver Sheen is without a peer as a priming or backpainting material, as its vehicle will penetrate and seal the new wood or metal against moisture more effectively than any other material that could be used. It also presents a surface of minute "teeth" that gives the top coats of paint or enamel something to adhere to. On new galvanized metal structures, Silver Sheen and Gilasfo will adhere without previous treatment or weathering—merely apply a single coat and the metal is perfectly protected.

Engineering Service

Our Engineering Department will readily furnish you with necessary information and helpful suggestions that will enable you to meet your particular problem.

CANADIAN FACTORY: WALKERVILLE, ONT.

SOLD IN THE PRINCIPAL CITIES OF THE WORLD

(1) The Company

Berry Brothers were established in 1858 and the experience of over seventy (70) years of continuous business has built an enviable reputation as manufacturers of high grade paints and varnishes. The formulas and methods of manufacture are time tested. The various brands have been well and favorably known over a period of time sufficient to guarantee their durability and reliability to the discriminating architect.

(2) Reliability

The Company's rating in Bradstreet's and Dun's is over \$1,000,000—first grade of credit.

(3) Manufacturing Facilities

The plant, one of the largest in the country, is thoroughly modern in all its equipment facilities. The "mass-action" ageing or ripening facilities consist of a combined tankage capacity of one and one-half million (1,500,000) gallons.

Note: In the manufacture, especially of varnishes, color varnishes and enamels, the ageing or ripening in the mass is essential for completion of chemical changes necessary for stability and uniformity. The results of this process cannot be produced by any artificial means. Dependent on the grade of the particular product, this ageing process must be maintained for from 3 to 12 months.

The architect may rest assured that where essential to produce the best in quality, all materials bearing a Berry Brothers' brand are thoroughly aged in the mass before they leave the factory.

(4) Laboratory Control

More important than the manufacturing facilities is the chemical laboratory control of all products, from the purchase of the raw materials which must fulfill rigid laboratory specifications, to the control and constant inspection and supervision of all manufacturing processes. Berry Brothers maintain a group of chemical laboratories, each having a distinct function confined to a particular branch of the industry, such as the manufacture of varnishes, lacquers, shellac, color varnishes and enamels, etc. Most important of these is the Laboratory of Analytical Research and Manufacture wherein new materials and methods are analyzed and formulas are perfected before a product is merchandised under the Berry Brothers name.

The various laboratories and the personnel of trained paint chemists is under the supervision of a chief chemist of wide experience.

The facilities of these laboratories are at all times accessible to the architect for advice and assistance.

(5) Architectural Finishing Department

The factory maintains a practical finishing department where samples of finish and color may be developed to meet particular needs. We solicit the opportunity to co-operate with the architect in establishing standards of quality, color, etc., to meet his requirements.

(6) How to Select Paints, Varnishes and Lacquers

Particularly in the selection of paints, varnishes and nitro-cellulose products is the reputation and experience of the manufacturer of first importance. Chemical analysis is practically impossible and only in the selection of well known brands of known quality can assurance of high quality and durability be obtained.

Note: The durability of varnish, for example, depends in addition to the careful selection of the materials, more especially on the treatment of the material and particularly treatments involving heat. Varnish and lacquer deterioration results chiefly from chemical change—the more successful the process of manufacture has been in forming stable compounds the more assurance is there that no further change will take place on exposure. Only those products which involve no extensive chemical change can be successfully analyzed and duplicated on a laboratory scale. Products which require high temperature or long "mass-action" ripening cannot be analyzed and so duplicated. Chemical analysis of varnish, therefore, is not possible. Metallic salts and volatile constituents can be separated and determined, and from the presence of certain inorganic compounds the use of some materials may be indicated, but these furnish little to indicate the actual quality of the varnish.

The specifying of varnish ingredients is of no practical use since in the completed product the original ingredients do not exist and different treatments of the same materials invariably yield different products.

Physical tests afford the only trustworthy means of determining quality and durability and the tests of actual use and time are the only practical guide.

Care should be exercised in selecting the right product or brand for its particular use and here the manufacturer's recommendations, backed by intimate experience, should be the guide.

(7) Local Service

In all important centers there is accessible an experienced local representative thoroughly familiar with Berry Brothers' products. His services and recommendations may be obtained not only in assisting to select materials best adapted to the particular use, but he is available to the architect, without cost, in obtaining satisfactory samples of finish and color

and the practical supervision of work on the site.

(8) Technical Information

The general technical information given in this catalogue has been assembled from the data compiled and published by The American Paint and Varnish Manufacturers' Association, Inc., and may, therefore, be considered unbiased and authentic.

(A) BERRY BROTHERS ARCHITECTURAL FINISHES—DESCRIPTION**(A1) Lionoil (Clear and Colored)**

Note: See (C10j) for specification application index.

General—An exclusive Berry Brothers formula resulting in a product of remarkably wide adaptability as a waterproof rust and corrosion preventive for metals and a waterproof sealer for wood, cement, brick, etc. Made of a combination of several oils and varnish gums treated at high temperatures, its adhesive, penetrating, waterproof and wear-resisting qualities recommend it for wide architectural use. While the finished surface is hard and tough, it maintains a high degree of elasticity—it will not check, peel or flake off under the severest weather conditions.

Note: Lionoil has found its staunchest advocate in the airplane industry, both here and abroad, due to its efficient protection of duralumin against deteriorating influences of dampness, sea water and even acids. It is used on steel tubular frame work, ribs, spars and wooden parts.

The largest builders of small boats, canoes, speed boats and similar craft use Lionoil as a waterproof sealer for wood both on the inside and outside of the hulls. It acts as a binder for succeeding coats of spar varnish or lacquer, and saves one coat of spar. The world's largest builder of metal boats is a large user of Lionoil.

(A1a) Lionoil Clear—A clear amber liquid (transparent).

(A1b) Lionoil Colored—Made in black and white and nine attractive standard colors.

Adaptability—Exterior and interior metal, wood, cement, plaster, brick, etc.

Surface Appearance—Low velvet lustre.

Drying—Dust free in 2 hours, hard in 12 hours under proper drying conditions.

Covering Capacity—Brush applied, from four hundred (400) to six hundred and fifty (650) sq. ft. per gallon depending on surface.

Application—Lionoil Clear may be applied with a brush, or by dipping or spraying processes. On floors it may be applied with a mop. Lionoil Colored is for brush or spray application.

Cost—The "colored" costs approximately the same as pure lead and oil.

(A2) Lionoil Floor Enamel—Quick Drying (Gloss)

Note: See (C10k) for specification application index.

General—A quick drying waterproof gloss enamel with a Lionoil base (see (A1)). A rust preventative enamel for metals and a moisture-proof, durable, wear-resisting enamel for wood, cement, etc., under hard use and severe exposure.

Colors—Made in twelve attractive standard colors (see color chart, Page 6).

Adaptability—Exterior and interior metal, wood, cement, brick, etc.

Surface Appearance—Gloss.

Drying—Dust free in one hour, hard in four hours under proper drying conditions.

Covering Capacity—Brush applied over smooth surface, four hundred (400) sq. ft. per gallon.

Application—Brush application advocated. Is free flowing and leaves no brush marks.

(A3) Lionoil Metal Trim Enamel (Semi-gloss)

Note: See (C10l) for specification application index.

General—A high grade metal enamel with a Lionoil base (see (A1)). It adheres tenaciously to bare metal or priming coat, is a rust preventive, and resists the action of water, heat and extreme cold. It dries hard where often there is difficulty with lead and oil.

(A3a) Lionoil Metal Trim Enamel—Exterior—For exterior use.

(A3b) Lionoil Metal Trim Enamel—Interior—For interior use.

Colors—Both exterior and interior, made in two standard colors, dark golden brown and telephone green (see color chart, Page 4). Special colors will be made on quantity orders (50 gal. or over).

Adaptability—Exterior and interior metal doors and trim, sheet metal and steel windows, steel and cast iron stairs, ornamental iron, etc.

Surface Appearance—Semi-gloss, so closely resembling baked enamel as to be commonly mistaken for it.

Drying—Dust free in two hours, hard in ten hours under proper drying conditions.

Covering Capacity—Brush applied over smooth surface, six hundred (600) sq. ft. per gallon.

Application—Brush or spray. Flows out perfectly showing no brush marks.

(A4) Berrycraft House Paint (Lionoil Processed)

Note: See (C10p) for specification application index.

General—The highest grade of paint made under the supervision of experts who know the service required. The best materials obtainable are used. The white is made of pure carbonate of lead, pure zinc (French Process) refined linseed oil and Lionoil (see (A1)). The process of grinding and mixing is of the very latest and best. The colors used are finely ground, and thoroughly mixed.

Adaptability—Made to meet present day demands and building conditions. Particularly adapted for all exterior exposed surfaces. Made to endure wind, sun, rain, snow, ice and salt air.

Colors—Made in 32 standard colors and in Outside White (Gloss), Inside White (Flat) and Semi-gloss Interior, in white and 7 colors. (See color chart, page 13).

Note: Berrycraft House Paint color cards are made to fit three assortments—32 colors (full line) 16 colors and 8 colors.

Surface Appearance—A pleasing gloss.

Drying—Sets in 18 to 24 hours under normal drying conditions. Should not be recoated in less than 48 hours.

Covering Capacity—300 to 400 sq. ft. per gal., according to the surface to be covered.

Application—Applied with brush or spray.

(A5) Luxeberry Cement Coating (Flat)

Note: See (C10m) for specification application index.

General—A flat, washable, moisture-proof, hard, elastic finish for cement, brick, concrete, and interior plaster. It fills the pores preventing surface dusting; is non-absorptive and moisture-proof, therefore sanitary. It is durable and unaffected by heat and cold.

Colors—Made in white and six (6) standard colors. (See color chart, Page 6.)

Adaptability—Exterior and interior cement, stucco, brick, concrete and interior plaster. Ideal for walls and ceilings of hospitals, schools, office buildings, industrial plants, etc. Under a coat of Lionoil Floor Enamel, it is an economical, durable concrete floor finish. It is decorative and protective on exterior stucco, cement, concrete and brick and is especially effective in light courts, etc.

Surface Appearance—Flat.

Drying—Dust free in two hours, hard in eight hours under proper drying conditions.

Application—Brush or spray. Spreads as well as lead and oil.

(A6) Berry Brothers Mill White (Gloss, Eggshell, Flat)

Note: See (C10n) for specification application index.

General—A smooth, light reflecting, washable, elastic finish of reasonable cost for interior brick, concrete, plaster and wood surfaces. It is made by an exclusive process and should not be confused with ordinary paint. Due to its smooth surface which resists the adherence of small dust particles to a surprising degree, Berry Brothers' Mill White remains clean much longer than a surface covered with ordinary white paint. Since it does not chip and crack a renewal coat may be applied over the old.

Color—A pure, radiant white.

Adaptability—Especially adapted to industrial buildings where light reflecting walls and ceilings save expense in artificial light and increase visibility, efficiency and cleanliness. May be used economically to advantage in other classes of buildings for similar purposes.

Surface Appearance—Gloss, Eggshell or Flat.

Drying—Dust free in four hours, hard in twenty-four hours under proper drying conditions.

Covering Capacity—Six hundred (600) square feet of wood surface and approximately four hundred (400) square feet of brick or concrete surface per gallon.

Application—Brush or spray.

(A7) Stains (Oil and Acid)

Note: See (C10q) for specification application index.

(A7a) Berrytone Penetrating Oil Stains—These stains strike deeply into the wood without raising the grain, producing a solid uniform surface. They may be brushed on, but as in all staining operations, wiping-in always produces a more uniform color tone.

Made in twelve (12) standard stains. Special stains made when required to produce special effects.

Note: Oil stains are not as permanent or as clear in tone as acid stains. Penetrating oil stains contain ingredients which will affect varnish unless sealed with a coat of pure shellac.

(A7b) Berry Brothers Acid or Water Stains—These stains penetrate deeply and are clear in tone and permanent. They should only be used on new wood. Water stains tend to raise the grain of the wood which necessitates sanding. The addition of a small quantity of denatured alcohol to acid or water stains will greatly reduce the grain raising tendency. For standard stains see Page 11. Special stains made when required to produce special effects.

Note: Acid stains on veneered surfaces, especially where the veneer is thin, may affect the glue unless waterproof glue is specified, which is advocated.

(A8) Berry Brothers Paste Wood Filler (Light and Dark)

Note: See (C10r) for specification application index.

General—For filling or leveling the surface on open-grain wood under varnish or clear lacquer finish. Furnished in "Light" or "Dark" which may be colored to suit any special effect. Applied with a brush. For varnish finish, paste wood filler should be thinned or reduced with turpentine or turpentine substitute. For lacquer finish, pyroxylin paste wood filler must be specified or the paste wood filler reduced with lacquer thinner.

Note: Ordinary turpentine or benzine thinned paste fillers are acted upon by the solvents in the lacquer which constantly dry out the oil in the filler resulting eventually in the grain of the wood showing as though no filler had been used. Paste wood fillers thinned with pyroxylin thinner, for use with clear lacquer, creates an affinity between the two materials.

(A9) Lacklustre

Note: See (C10t) for specification application index.

General—Lacklustre is a combined penetrating stain and finish for new work only. It produces the same effect in one operation as staining, shellac and wax. A coat of Liquid Granite Dull over Lacklustre is recommended where wear is severe—this will give unusual service.

Colors—Made in twelve (12) standard color effects.

Adaptability—Particularly adapted to Flemish and similar period woodwork trim, exposed beams, trusses, furniture, etc.

Surface Appearance—Semi-gloss finish similar to polished wax.

Drying—Sets almost instantly, dries quickly.

Covering Capacity—Six hundred and fifty (650) sq. ft. per gallon.

Application—Applied with a cheese cloth pad or brush. Wiped off and polished with cheese cloth.

(A10) VARNISHES

Note: See (C10u) for specification application index.

(A10a) Berryspar (Gloss)

General—A high grade spar varnish of unusual characteristics. It has the same wearing qualities as the regular long oil spar varnish, but with the advantage that it is quick drying. For interior use it may be rubbed. It is moisture resisting and will not turn white.

Color—Light or pale.

Adaptability—Exterior and interior wherever exposed to the elements or subject to moisture, such as exterior doors, interior of wood windows and trim, baseboards, furniture, etc.

Surface Appearance—Gloss or may be rubbed dull.

Drying—Dust free in 2 hours, hard in 8 hours under proper drying conditions.

Covering Capacity—Six hundred (600) sq. ft. per gallon.

Application—Applied with a brush or spray.

(A10b) Luxeberry Wood Finish (Gloss)

General—An interior cabinet rubbing varnish of the highest quality.

Color—Light or pale.

Surface Appearance—"Gloss," which may be rubbed to an eggshell finish.

Drying—Dust free in three hours, hard in eight to ten hours under proper drying conditions.

Covering Capacity—Six hundred (600) sq. ft. per gallon.

Application—Applied with a brush or spray.

(A10c) Liquid Granite Floor Varnish (Gloss and Dull) Also "Quick Drying" (Gloss and Dull)

General—An extremely tough and durable interior floor varnish of the highest quality. It is so elastic that the wood may dent under a blow, but the varnish will not crack. Can be rubbed.

Liquid Granite "Dull" contains no wax and is as durable as the "Gloss."

Color—Medium light.

Adaptability—Floors in the best class of work and on interior standing trim where the greatest in durability is demanded such as public and semi-public buildings, schools, etc. Advocated for stair treads, baseboards and similar parts in all classes of work where the wear is severe.

Surface Appearance—"Gloss," which may be rubbed dull. "Dull," dries flat without rubbing. "Semi-gloss," which closely resembles rubbed finish by blending Gloss (1 part) and Dull (3 parts).

Drying—Dust free in 4 hours, hard in 10 hours under proper drying conditions.

Note: Liquid Granite Floor Varnish—Quick Drying dries dust free in 1 hour and hard in 4 hours.

Covering Capacity—Six hundred (600) sq. ft. per gallon.

Application—Applied with a brush or spray.

(A11) LACQUERS CLEAR SPRAYING

Note: See (C10v) for specification application index.

General—Berryloid Clear Lacquers are supplied at spraying consistency and are to be applied full body (unless specially otherwise specified by the manufacturer).

They produce a particularly durable, hard, transparent surface, which when applied over a dry surface will not check or crack but will expand and contract with the surface. May be applied to metal as well as wood.

Note: All clear lacquer materials must comply with the Government formulas as approved by the Bureau of Standards and must not contain less than 22% of non-volatile constituents, of which 7% must be nitrocellulose—the remainder shall consist of gums and plasticizers properly proportioned to make a balanced lacquer with easy sanding and rubbing qualities. The volatile portion of the lacquer shall be formulated to give the lacquer good spraying characteristics, free from blushing and a minimum of pebble on drying.

(A11a) No. 364 Berryloid Clear (Gloss)

A clear, transparent gloss lacquer for interior cabinet work. Can be rubbed.

(A11b) No. 502 Semi-gloss Berryloid Clear

For application over No. 364 Berryloid Clear Lacquer to eliminate the cost of rubbing and especially desirable on carved surfaces where it is impractical to rub the surface to a dull finish. Should always be applied over gloss lacquer undercoat to build sufficient foundation.

(A11c) No. 398 Flat Berryloid Clear

Adapted to same uses as No. 502 Semi-gloss except that a dead flat effect is produced.

(A11d) No. 507 Berryloid Clear Exterior (Gloss)

A clear, transparent gloss lacquer for exterior use such as exterior doors, trim, etc., and the interior or exterior wood sash, window sills, baseboards, etc., where severe wear and contact with moisture is to be encountered. It is unaffected by rain or the disintegrating action of the sun's rays. Can be rubbed.

Color—Light or pale.

Adaptability—No. 364 for the highest quality of interior cabinet work either gloss or rubbed finish; No. 502, over clear gloss lacquer to save the cost of rubbing; No. 507, for severe wear and exterior use. Adaptable for all classes of work.

Surface Appearance—No. 364 and 507, high gloss. No. 502, semi-gloss which closely resembles a rubbed surface. No. 398, dead flat.

Drying—Dust free in 10 minutes, hard in one hour under proper drying conditions.

Covering Capacity—Six hundred (600) sq. ft. per gallon.

Application—Spray only, using from 60 to 80 pounds air pressure.

(A12) ENAMELS

Note: See (C10w) for specification application index.

(A12a) Berry's Enamel Undercoat (Semi-flat)

General—A triple-ground undercoat for enamels of the highest quality. It has great opacity and flows so smoothly without brush marks that it requires when properly applied little or no sanding to provide a perfect surface for the enamel.

Colors—Made in white to be colored to match the enamel coats. Can be obtained colored to match the standard enamels (See Page 4) or in special colors where quantity warrants (50 gals. or over).

Adaptability—As undercoats for the highest type of enamel finish.

Surface Appearance—Semi-flat.

Drying—Dust free in 3 hours, hard in 8 hours under proper drying conditions.

Covering Capacity—Five hundred (500) sq. ft. per gallon.

Application—Applied with a brush or spray.

(A12b) Luxeberry Enamel (Gloss and Eggshell)

General—A long-oil, rubbing enamel of the highest quality. Produces a smooth tilelike surface, easily kept clean.

Colors—Made in white, old ivory and rich cream. (See color chart, Page 4).

Adaptability—Exterior and interior woodwork trim in the best class of work. Also for plaster surfaces in bathrooms, kitchens, etc.

Surface Appearance—High Gloss which may be rubbed dull. Eggshell (semi-gloss) which closely resembles a rubbed finish, without the expense of rubbing.

Drying—Dust free in 4 hours, hard in 24 hours under proper drying conditions.

Covering Capacity—Six hundred (600) sq. ft. per gallon.

Application—Applied with a brush or spray. It is full bodied, flows freely without brush marks.

(A12c) Berrycraft Quick Drying Enamel (Gloss)

General—A durable new process, quick drying enamel of great opacity. It is not a lacquer—has no disagreeable odor or unusual fire hazard and requires no special thinner. Berrycraft Enamel is waterproof and is unaffected by heat or cold. May be rubbed.

Colors—Made in black and white and eleven (11) attractive colors. (See color chart, Page 4).

Adaptability—Made to meet the modern demand for speed for both exterior and interior use. Particularly adapted for apartments hotels, etc., for both interior trim, plaster and fur-

niture. Adaptable for use on wood, cement, metal, brick and plaster.

Surface Appearance—Gloss which may be rubbed dull.

Drying—Dust free in a few minutes, hard enough to re-coat in four (4) hours under proper drying conditions.

Covering Capacity—Six hundred (600) sq. ft. per gallon.

Application—Applied with a brush or spray. Brushes on easily without brush marks or laps.

(A12d) Berry's Radiator Enamel (Flat)

Note: See (C10w4) for specification application index.

General—A special enamel designed to increase the efficiency of radiators by at least 20% without burning more fuel. Does not lose efficiency when applied over sound old finish. Wears well, is unaffected by heat and is washable. Will not chip or flake.

Note: Tests made in the Engineering Department of the University of Michigan prove that the correct radiator enamel in the proper colors, increases heat transmission. Radiators painted with flake metal pigments (aluminum, gold or bronze) stand seventh. These same finishes covered with Radiator Enamel immediately increase the radiator's efficiency. Tests also prove that flat enamel radiates more heat than gloss. The remarkable fact is that the color of the enamel, likewise plays an important part. The University tests show color efficiency in the following order:

(1) Flat white enamel (2) Cream flat enamel (3) Red flat enamel (4) Green flat enamel (5) Yellow flat enamel (6) Black flat enamel (7) Aluminum flat enamel (8) Brown flat enamel (9) Bare iron flat enamel.

Color—Made in white only which may be tinted with pure colors ground in oil.

Adaptability—Radiation, whether exposed or concealed, exposed piping and connections.

Surface Appearance—Flat.

Drying—Dust free in 2 hours, hard in 6 to 8 hours under proper drying conditions.

Covering Capacity—Four hundred and fifty (450) sq. ft. per gallon.

Application—Applied with a brush or spray. Flows out leaving no brush marks.

(A13) PLASTER PAINTS

Note: See (C10x) for specification application index.

(A13a) Berryflat (Eggshell)

General—An oil paint wall finish made of the best raw materials. Produces a hard, non-porous surface that wears and washes remarkably well. One (1) coat over Delitone Sealer or equal parts of Lionoil Clear and Berryflat as a sealer.

Color—Made in white only to be colored as desired with pure colors ground in oil.

Adaptability—Interior plaster surfaces.

Surface Appearance—Soft, lustrous eggshell which may be stippled.

Drying—Dust free in 2 hours, hard in 6 to 8 hours under proper drying conditions.

Covering Capacity—Five hundred (500) sq. ft. per gallon.

Application—Brush or spray.

(A13b) Delitone and Delitone Thinner (Semi-gloss)

General—This material comes in paste form and when used with Delitone Thinner, produces an excellent sealer for plaster surfaces. Two coats produce a tough elastic, non-porous finish.

Pencil marks, ink spots and match scratches can be easily removed from this finish without impairing its lustre. Takes an excellent stipple finish.

Its excellent appearance may be maintained for years by periodic washing.

Color—Made in white only (not blue) readily tinted to any shade with pure colors ground in oil.

Adaptability—Interior plaster brick and cement surfaces in the best work.

Surface Appearance—Semi-gloss. Takes an excellent stipple finish.

Drying—Dust free in 4 hours, hard in 24 hours under proper drying conditions.

Covering Capacity—Seven hundred and fifty (750) sq. ft. per gallon, first coat; six hundred (600) sq. ft. per gallon, second coat.

Application—Brush or spray.

(B) PREVENTABLE DEFECTS**(B1) GENERAL**

Independent of the quality of finish unsatisfactory and defective work frequently results from conditions over which the manufacturer has no control. That the architect may properly allocate responsibility and guard against their occurrence the following common defects and their causes are set forth for his assistance. Many of the provisions suggested in the Master Specifications given on Pages 8 to 17 are based on this information.

(B2) PAINT DEFECTS**(B2a) "Peeling"**

Imperfect attachment of the paint film to the surface due to application over a damp, greasy or resinous surface. Often induced by artificial heat driving moisture outward under paint film or by capillary moisture rising into wood in contact with moisture.

(B2b) "Scaling" and "Flaking"

Premature detachment of paint in small scales or larger flakes. A brittle paint will scale or flake (dependent on degree of brittleness) under the same conditions that a more elastic paint will peel as in (B2a).

(B2c) "Blistering"

Due to heat vaporizing underlying moisture. New paint is more subject to this defect than old unless the heat is excessive. Incompletely dried lumber is the chief cause.

(B2d) "Alligatoring"

An incomplete form of peeling. The paint cracks into large segments resembling the back of an alligator—one end of the segment loosens and curls back from the surface, the other end remains firmly attached. Fine alligatoring is usually termed checking. Heavy coats of paint, especially if slow drying, tough and inelastic, applied to unseasoned wood will alligator. (Resin drier in zinc paints is often the cause of checking).

(B3) VARNISH DEFECTS**(B3a) "Bloom"**

Opalescence of surface caused by contact with moisture (excessive humidity) before complete drying. It may occur intermittently as a temporary phenomenon, disappearing on drying. If ammonia is present in the atmosphere the change is chemical and may be permanent.

(B3b) "Blistering"

Formation of blisters on the surface. Possibly due to underlying spots of grease, sap or moisture; excessive heat or direct sun exposure during the process of drying.

(B3c) "Spotting"

Discolored spots on the surface. Possibly due to chill of the fresh varnish which separates its constituents; substances on the surface at time of application; splashes of liquids before dry.

(B3d) "Crazing"

Minute interlacing cracks on the surface. Possibly due to extreme cold; excess of hard gums in the particular varnish—selection of a varnish of insufficient elasticity for the particular use.

(B3e) "Sweating"

Reappearance of lustre on a "rubbed to a dull finish" surface. Most frequently due to application of last coat before under coats have properly hardened.

(B3f) "Powdering"

Gradual crumbling of the varnish into dust. Possibly due to the selection of an improper varnish for the particular use (interior varnish for exterior use), or to accidental and abnormal exposures.

(B3g) "Crawling"

Refusal to spread or flow smoothly on a surface. The cause is physical due to preponderance of surface tension and cohesion over capillary attraction. Possibly due to excessive viscosity of the varnish or the condition of the surface itself such as low temperature; moisture, grease, etc., especially where surface is of high polish.

(B3h) "Cracking"

Intensification of "crazing" (see (B3d)) due to the same causes.

(B3i) "Chipping" or "Flaking"

Often follows "cracking" due to the same causes.

(B3j) "Deadening"

The opposite of "sweating" (see (B3e)). Possibly due to insufficient or defective undercoat but most frequently to improper filling of the wood.

(B3k) "Tackiness"

Adhesive property of incomplete drying. After "setting" varnishes retain "tackiness" until completely dry. Slow drying varnishes remain "tacky" longer than quick drying varnishes. A slight rise in temperature may cause recurrence in some varnishes though not objectionable in the spar varnishes. Proper selection of varnish for its particular use is essential. Tackiness frequently occurs in refinishing old work due to application over unclean, greasy surfaces when complete removal is the only remedy.

(B3l) "Pitting" or "Pinholing"

Due to changes in atmospheric conditions during drying; mixing different grades of varnish; application over "sweating" (see (B3e)), incompletely dried undercoats or in a humid atmosphere; rubbing through to undercoat; dirty or frothy varnish; underlying spots of grease or soap; cold draughts.

(B3m) "Enameling" or "Silking"

Appearance similar to enameled leather or silk. Due to application in hot, humid weather; too long continued brushing; use of brushes saturated with oil; mixing different grades of varnish.

(B3n) "Clouding"

Loss of lustre. Due to application over unseasoned wood; imperfectly dried undercoats; or more frequently porous undercoats. Coal gas may cause clouding.

(B3o) "Seedy" or "Sandy" Varnish

Varnish may be found full of small grains. Due to chill in transit or in storage or a decided difference in temperature between the varnish and the work. Same appearance may be caused by defective or improperly cared for brush.

(B3p) "Runs" or "Sags"

Irregularities of surface due to uneven flowing. Due to too much varnish; incomplete brushing; an inelastic brush. When fresh they may be wiped off with turpentine. If in finishing coat of bright varnish removal of coat is necessary on fine work. If in rubbing coat, rubbing will remove them.

(B3q) "Wrinkling" or "Crimping"

Conditions similar to "runs" and "sags." Generally due to same causes (see (B3p)) but chiefly to an attempt to substitute a few heavy coats for a greater number of thin, properly applied ones. Also due to sudden lowering of temperature when freshly applied.

(B3r) "Brush Marks"

Marks of brush due to working after the varnish has begun to set. In rubbing coats they may be removed in the rubbing. Brush marks in undercoats will show through the subsequent coats—each coat therefore, successively, must be smooth for perfect results and the first coat in this respect is quite as important as the last.

(B3s) "Ribbs"

The result in the last coat of brush marks in undercoats. Often due to use of rubbing varnish of excessive body which favors heavy coats.

(B3t) "Grain Showing"

The result of lack of sanding after staining and filling both of which operations may raise the grain of the wood surface which may have previously been in perfect condition.

(B3u) "Crumbling" or "Pershing"

Gradual loss of lustre resulting finally in disruption of surface and complete destruction of varnish. Quite often the result of washing with water heated above a tepid degree. Also due to ammonia fumes, coal gas, salt sea air, soil of limestone localities.

(C) PAINTING AND FINISHING—MASTER SPECIFICATIONS

Note: Notes in italics are explanatory or advisory only and should not be included in the specifications.

Note: The scope of this specification covers conditions ordinarily encountered. Select and include only those clauses which apply to the particular work supplemented by special conditions or topics not herein included. Local ordinances and trade customs should be considered.

(C1) General Conditions

(C1a) The general conditions governing the General Contract apply to the work under this division—see pages (.....).

Note: The American Institute of Architects' standard form of general conditions is advocated.

(C2) Work Included

(C2a) The work included under this heading shall be the painting and finishing of the following:

Note: Here give the general scope of the work such as exterior and interior woodwork; exterior and interior brick, concrete, stucco; exposed steel; iron and sheet metal; plaster walls and ceilings, etc.

(C2b) The following items are furnished by the manufacturer completely finished and require no further finish under this contract.

Note: Here list such items as vault doors, metal doors and trim, metal stall partitions, metal cabinets, special cabinet work, fixtures, etc.

(C3) Exterior Painting Conditions

Note: Since not only the appearance but the life of the painter's finish is materially affected by the weather conditions the following provisions are desirable. Exterior painting should only be done in dry, mild seasons. See "Preventable Defects," Page 7.

(C3a) Paint shall not be applied in moist or humid weather. No paint shall be applied in temperatures below 50° F. or in extreme heat.

(C4) Condition of the Building

Note: Since not only the appearance but the life of the painter's finish is materially affected by the condition of the building, over which the painting contractor has no jurisdiction, the following provisions are desirable for the protection of this contractor. The carrying out of these provisions should be allocated under the proper contract in other specification divisions. See "Preventable Defects," Page 7.

(C4a) (Short Form)

(C4a1) During the application of painter's finish effective working conditions will be maintained as to absence of dampness and humidity; uniformity of temperature (70° F.); ventilation necessary to assist drying; elimination of dust producing operations (other than sanding). The absence of fire hazards shall be maintained.

(C4b) (Detailed Form)

(C4b1) Elimination of Dampness—No interior painter's finish shall be applied until the building (particularly plaster) is thoroughly dry.

(C8) CONDITION OF SURFACES—PRELIMINARY PROVISIONS

Note: Since not only the appearance but the life of the painter's finish is materially affected by the condition of the surfaces to be finished over which the painting contractor has no jurisdiction, the following provisions are desirable for the protection of this contractor. The carrying out of these provisions should be allocated under the proper contract in other specification divisions.

(C8a) General

(C8a1) All surfaces to be finished under this contract shall be clean and dry.

(C8a2) Any surface not in suitable condition to receive the finish contemplated shall be reported to the architect or his authorized agent before work is commenced.

(C4b2) Temperatures—A uniform temperature of approximately 70° F. will be maintained day and night during the application of painter's finish. Finish shall not be applied in summer in extreme heat or under damp, humid conditions. Paint store rooms will be maintained approximately 70° F. Painter's finish shall be at room temperature before application.

(C4b3) Ventilation—Proper ventilation will be maintained to carry off the volatile gases and promote drying.

(C4b4) Dust Prevention—Absence of dust (other than sanding) induced by sweeping or work by other trades will be maintained.

(C4b5) Fire Safeguards—Smoking is prohibited in paint store and mixing rooms or rooms where painter's finish is being applied. All paints and finish containers shall, when not in use, be kept sealed or covered. All oily waste, rags, etc., shall be collected each day and, unless destroyed, temporarily stored in tight covered metal containers to prevent spontaneous combustion.

(C5) Scaffolding

(C5a) This contractor shall provide and erect all scaffolding, staging, etc., necessary for the proper execution of his work.

(C5b) He shall co-operate with other trades to the extent that erection of scaffolding shall not conflict with the execution of other work immediately preceding or carried in, without undue conflict, simultaneously with the painting and finishing.

(C5c) If, after due authority has been granted to erect scaffolding, it is necessary to remove parts therefore for the accommodation of others, demolition and re-erection shall be done only after allocation of the cost thereof, if any, has been equitably adjusted.

(C6) Protection

(C6a) This contractor shall furnish and lay drop cloths, so placed as, at all times, to adequately protect floors and other surfaces from spatter and droppings.

(C6b) This shall include the protection of all (fixed furniture and equipment) (movable furniture) (specify), etc.

(C6c) The canopies of all lighting fixtures shall be unscrewed and set away from the surface to be finished and the fixtures adequately covered and protected from injury.

(C6d) Remove all electric switch plates and similar equipment before painting and finishing and replace in as good condition as found.

(C6e) Damage done to the building, fixtures or equipment, through lack of protection, accident or carelessness incident with work under this contract shall be satisfactorily repaired or made good by replacement at this contractor's expense.

(C7) Cleaning

(C7a) At completion remove all spots, stains, oil, etc., attributable to work under this contract, from (walls) (ceilings) (trim) (floors) (furniture) (fixtures) (hardware) (glass) (specify) and leave in as good condition as found.

(C8a3) Application of the first coat of finish shall be construed as acceptance by this contractor of the surface to be finished.

(C8b) New Exterior Woodwork

(C8b1) Exterior woodwork is presumed to be of thoroughly seasoned stock, clean and free of surface defects.

(C8b2) Incidental minor cleaning, sanding and dusting of surfaces shall be done by this contractor that these shall be in perfect condition to receive finish.

(C8c) New Interior Woodwork

(C8c1) (Standing woodwork trim) (wood floors) (specify)

etc., are presumed to be clean and sanded smooth, free of machine marks or surface defects and in suitable condition to receive advantageously the painter's finish under this contract.

(C8c2) Incidental necessary minor cleaning, sanding and dusting of surfaces shall be done by this contractor, that these shall be in perfect condition to receive finish.

(C8d) Old Exterior Woodwork

Note: On the condition of the existing paint surface should depend the necessity of its complete removal or its use as a base for new finish.

(C8d1) Remove all loose paint and dust by scraping, sandpapering, wirebrushing, dusting, etc.

(C8d2) Carefully burn off all existing paint down to the original wood surface without charring. Sandpaper where necessary to leave the surface smooth.

(C8d3) Any necessary carpenters' repairs will be done by others before new painter's finish is applied.

(C8d4) Touch up all abrasions with paint as specified for finish.

(C8e) Old Interior Woodwork

Note: On the condition of the existing finish and the nature of the proposed new finish should depend the necessity of its complete removal or its use as a base for new finish. In the case of clear varnish it is usually advisable to remove the existing finish.

(C8e1) Remove existing finish with paint remover down to the original wood and sand smooth.

(C8e2) Bleach the woodwork with dilute oxalic acid to restore it as nearly to its original color and condition as possible and when bone dry sand smooth.

Note: Required only for new varnish finish.

(C8e3) Wash existing woodwork thoroughly with soap and water to remove all dirt, grease and wax. Dry completely and sand to a smooth surface.

Note: Required where sound existing finish remains to be refinished with enamels, paints, etc.

(C8e4) Thoroughly rub down existing woodwork with pumice and water and completely dry.

Note: Required in good work where sound varnish remains to be refinished with clear varnish. Cleaning with benzine is not sufficient.

(C8e5) Any necessary carpentry will be done by others before new painter's finish is applied.

(C8e6) Touch up all abrasions with paint as specified for finish.

(C8f) New Plaster Work

(C8f1) Remove all dust and sand particles adhering to the surface by dusting, scraping and sandpapering.

(C8f2) Cut or score out all cracks that may have appeared and fill with plaster of paris or prepared patching plaster leveled smooth with a putty knife. When dry, sand smooth. Surface of crack shall match as closely as possible surrounding surface.

(C8f3) Where necessary, sand smooth ornamental plaster work, especially at joints and intersections.

(C8f4) Treat all plaster surfaces with a solution consisting of eight ounces of zinc sulphate to the gallon of clean water and allow to dry at least three (3) days. Remove all loose crystals from the surface before finishing.

Note: Advocated on all new plaster to neutralize alkali usually prevalent. Phenolphthalein applied by touching the walls at various points turns red if alkali is present.

(C8g) Old Plaster Work

(C8g1) Remove existing (kalsomine) (specify) finish.

(C8g2) Wash thoroughly with soap and water or benzine to remove all dirt and grease. When dry, remove all scale, flakes, blisters, etc., by scraping and sanding. Thoroughly sand smooth the entire surface.

Note: Use where new finish is applied over existing paint finish.

(C8g3) Cut or score out all cracks and abrasions and fill with plaster of paris or prepared patching plaster leveled smooth with a putty knife or trowel. When dry sand smooth and shellac. Surface of crack or patch shall match as closely as possible adjacent surfaces.

(C8g4) Touch up all abrasions with paint as specified for finish.

(C8h) New Metal Work

(C8h1) Remove all dirt, grease and rust with benzine. Use sandpaper or wire brush if necessary.

(C8h2) Where fluid solder flux has been used, clean thoroughly with benzole.

(C8h3) Galvanized work shall be thoroughly washed with acetic acid (vinegar).

(C8h4)—Touch up all abrasions with paint as specified for finish.

(C8i) Old Metal Work

(C8i1) Wash thoroughly with soap and water or benzine to remove all dirt and grease. When dry, remove all scale, flakes, blisters, etc., by scraping and sanding. Thoroughly sand smooth the entire surface.

(C8i2) Touch up all abrasions with paint as specified for finish.

(C9) GENERAL REQUIREMENTS

(C9a) Workmanship

(C9a1) All labor shall be performed in the best manner by skilled workmen.

(C9a2) All paint shall be thoroughly and smoothly brushed out to a uniform film without runs, sags or brushmarks.

(C9a3) Varnish and enamel shall be flowed on and carefully brushed out to a uniform film without runs, sags or brushmarks.

Note: A number of properly applied thin coats are much more desirable than a fewer number of heavy coats.

(C9a4) Each coat of finish shall be given sufficient time to dry hard before application of the succeeding coat.

(C9a5) Immediately prior to the application of each coat, thoroughly dust the surface clean.

(C9b) Knots, Sap, Etc.

(C9b1) Cover all knots and all sappy and resinous spots on woodwork to be painted with a coat of shellac, before priming.

(C9c) Staining

(C9c1) Stains shall be evenly applied in strict accordance with the manufacturer's specifications to produce the effect required to match in color the approved samples.

(C9c2) Before the application of acid stains, the wood shall be sponged with cold water to raise the grain. When dry, sandpaper smooth. Apply the acid stain and when dry sand lightly.

(C9d) Filling

(C9d1) All open-grain woods shall be filled to produce a level smooth surface. Allow the filler to set but before it has hardened, wipe off (across the grain) any surplus from the surface. When hard, sand lightly. Filler shall be of such color as to produce the effect required to match the approved samples.

Note: Open-grain woods are Ash, Butternut, Chestnut, Elm, Mahogany, Oak, Rosewood and Walnut. Birch, Gumwood, Maple and Cherry, classed as close-grain woods, will take a filler where desired to accentuate the grain of the wood.

Note: See particularly (A8) page 3 for filler used under lacquer.

(C9e) Puttying

(C9e1) All nail holes shall be carefully filled with putty after the first or priming coat of paint or stain. Putty on natural or stained woodwork shall be colored to match the wood or stain.

(C9f) Sanding

(C9f1) Each coat of interior finish except the last or finishing coat shall, when thoroughly dry and hard, be lightly sanded smooth with fine sandpaper (0, 00, 000 or 0000 as best adapted). Dust clean after each sanding operation.

(C9g) Rubbing

(C9g1) Where so specified, the last or finished coat of varnish, lacquer and enamel *when thoroughly hard* shall be uniformly rubbed to a dull finish with 3f powdered pumice stone and water or rubbing oil. Great care shall be exercised that the finished coat shall not be rubbed through on arrises and that there be no bright flecks in depressions of mouldings, carvings, etc.

(C9h) Storage, Mixing, Etc.

(C9h1) All material shall be stored and mixed in a clean room kept at a uniform temperature (70° F.) and locked when not in use. Access at all times shall be provided to the architect or his authorized representative.

(C9h2) A sufficient number of unlabeled, clean, covered mixing and storage receptacles shall be provided to properly carry out the work under this contract. All empty receptacles shall be kept scrupulously clean.

(C9h3) Varnish, enamels, etc., shall be kept in full, tightly sealed containers. Remnants from larger cans shall be poured into smaller cans for preservation, the object being to remove air-space.

Note: The formation of skin or crust on varnish in the can is due to surface oxidation from exposure to the air. Such exposure, even in partly filled sealed containers, permits evaporation of volatile ingredients and leads to deterioration.

(C9h4) All brushes shall be kept clean and in perfect condition when not in use.

(a) Paint brushes when not in use shall be provided with "brush keepers" and remain suspended with bristles immersed in Lionoil or Damar Varnish.

(b) Varnish and enamel brushes when not in use shall be provided with "brush keepers" and remain suspended with bristles immersed in "brush keeper varnish."

Note: Brush keeper varnish is a finishing varnish made without dryers and therefore practically non-drying. Varnish brushes should not be kept in linseed oil nor in turpentine nor washed with the latter. "Seedy" varnish (see (B30) page 7) is usually attributable to brushes washed or kept in turpentine. Proper care of brushes is of the utmost importance.

(C9i) Samples

(C9i1) Complete samples made in accordance with the specifications under the direction of the architect shall be furnished on all work.

(C9i2) Accepted final samples shall be of the size and number required by the architect.

(C9i3) The finished work shall match the accepted samples in color and finish.

(C10) MATERIALS**(C10a) General**

(C10a1) All material, unless otherwise specially mentioned, shall be of the brand designated as manufactured by Berry Brothers (hereinafter designated B. B.), or equivalent subject to the architect's approval.

(C10a2) Where specific brands are not named, materials in every instance shall be the best of their respective kinds.

(C10a3) All materials shall be delivered at the building in the original cans or containers with seals unbroken and labels attached.

(C10a4) All varnishes and enamels shall be used as they come from the manufacturer without reducing.

Note: Varnish is a product of chemical reactions at high temperatures. Mixtures of two varnishes or the addition of thinners "in the cold" may induce separations and precipitations certain to affect the quality.

(C10a5) No material shall be reduced except under the manufacturer's direction and then only with the stipulated reducer used in the quantity and manner recommended.

(C10a6) All paints and stains shall be of colors as selected by the architect. In all cases undercoats shall match the finished coat in color and shade. Only where specifically advocated by the manufacturer shall materials be purchased in the white for subsequent tinting or coloring.

Note: Coloring pigments all have chemical activity which vary in considerable degree. Normal endurance and appearance can best be assured by maintaining a chemical balance between pigments, oils, driers and other ingredients as well as the careful selection of the ingredients themselves. It is advocated that wherever possible paints of the color or shade required be obtained ready to apply from the manufacturer or of the general color and shade requiring the least addition of color pigments.

(C10b) Spraying Equipment

(C10b1) Spraying equipment shall be of type and capacity best adapted to the work, subject to the architect's approval.

(C10b2) Compressors shall be motor driven.

(C10b3) Compressor shall be set in location designated by the architect and temporary rigid piping shall be installed so as not to conflict with the work of other trades.

(C10b4) All paint carrying flexible hose, nozzles and equipment shall be thoroughly cleaned after each day's work and maintained in first class working condition.

(C10c) Brushes

(C10c1) All brushes shall be new and of the best grade, of sizes and types best adapted for the particular work.

(C10d) Apex Varnish Remover (B. B.)

Note: For application see (C8e1).

(C10e) Putty

(C10e1) Putty shall be of the best grade consisting of whitening and pure raw linseed oil.

(C10f) Linseed Oil

(C10f1) Linseed oil (raw or boiled as best adapted to the purpose) shall be pure and thoroughly settled, meeting fully the current specifications of the American Society for Testing Materials.

(C10g) Turpentine

(C10g1) Turpentine shall be pure gum spirits of turpentine meeting fully the current specifications of the American Society for Testing Materials.

(C10h) Shellac (B. B.)

(C10h1) Shellac shall consist of 4½ lbs. of Berry Brothers pure gum shellac (SDC orange or SDC white as so specified) to the gallon of pure (188 proof) denatured grain alcohol.

(C10i) Coloring Pigments (B. B.)

(C10i1) Coloring pigments shall be Berrycraft Pure Colors, ground in pure linseed oil.

(C10j) Lionoil (B. B.)

Note: See (A1) Page 2. A rust and corrosion preventive on metals. A moisture proof sealer for wood and for stopping suction on brick, cement or stucco surfaces to be painted. For application see (C11a, d & e) (C12d) (C13a & d) (C14a & d) (C15f) (C17b) (C18b3 & b5) (C18c6 & c7) (C18d3) (C18e1) (C19b1, b2 & b3) (C19h3) (C20b & d) (C22b1) (C22e) (C22c4 & c6).

(C10j1) Clear

Note: May be covered with spar varnish.

(C10j2) Colored

(A) Priming Coat—Add one quart of "clear" to the gallon of "colored."

Please do not detach color samples. Duplicate color cards will be furnished on request.

(B) Second Coat—Add one pint of "clear" to the gallon of "colored."

(C) Third Coat—Full body as it comes from the can.

Note: One-half pint of Lionoil Clear added to the gallon imparts an enamel-like gloss finish.

(C10k) Lionoil Floor Enamel Quick Drying (Gloss) (B. B.)

Note: See (A2) Page 2. For application see (C15e) (C17b & c) (C18b4) (C19d2) (C22b1).

(C10l) Lionoil Metal Trim Enamel (Semi-gloss) (B. B.)

Note: See (A3) Page 2. A moisture-proof rust preventive. For application see (C11c) (C12c) (C13c) (C14c).

(C10l1) Exterior

(C10l2) Interior

(C10m) Luxeberry Cement Coating (Flat) (B. B.)

Note: See (A5) Page 2. A flat exterior and interior moisture-proof finish for brick, stucco, concrete, plaster. For application see (C15d & e) (C17b & c).

(C10n) Berry Brothers Mill White (Gloss) (Eggshell) (Flat) (B. B.)

Note: See (A6) Page 2. A pure white gloss, semi-gloss or flat cleanable, interior wood, brick, concrete and plaster wall and ceiling paint, particularly for industrial use. For application see (C16).

(C10o) Lead and Oil Paint (for wood)

(C10o1) White lead shall be pure carbonate of lead as made by (state manufacturer) or equivalent ground to a paste in raw linseed oil. Lead and oil paint shall be mixed as follows:

(a) Priming Coat—100 lbs. white lead, 4 gals. raw linseed oil, 2 gals. turpentine, 1 pt. best grade dryer (state manufacturer), color pigment as required.

(b) Second Coat—100 lbs. white lead, 1½ gals. raw linseed oil, 1½ gals. turpentine, 1 pt. of dryer, color pigment as required.

(c) Third (Finish) Coat—100 lbs. white lead, 3½ gals. raw linseed oil, 1 pt. turpentine, 1 pt. dryer, color pigment as required.

Note: The addition of a quart of Lionoil (substituting this quantity for a like quantity of Linseed oil) in the priming coat adds effective penetration and sealing qualities. The addition of 1 pint of Lionoil to the gallon of finish coat imparts an enamel-like gloss and lessens the possibility of dusting or chalking.

(C10p) Berrycraft House Paint (for wood) (BB)

(C10p1) Prepared mixed paint shall be Berrycraft House Paint. The priming, second and third coats shall be applied in accordance with the directions on each can.

Note: See (A4) Page 2. Berrycraft House Paint is made of pure carbonate of lead and pure zinc oxide combined in the proper proportions with refined linseed oil and Lionoil Drier. All ingredients are carefully selected, are uniform in quality and machine mixed under ideal conditions assuring not only the maximum in protection, appearance and life, but economy. For application, see (C18b6) (C19b1, d3 & e1).

(C10q) Stains

(C10q1) Berrytone Penetrating Oil Stains (B. B.)

Note: See (A7a) Page 3. For application see (C18c1 & d1) (C19f1 & h1) (C22c1 & d1).

(C10q2) Berry Brothers Acid Stains (B. B.)

Note: See (A7b) Page 3. For application see (C18c1 & d1) (C19f1 & h1) (C22c1 & d1).

(C10r) Paste Wood Filler (B. B.)

Note: See (A8) Page 3. For application see (C18c2 & d2) (C19f2 & h2) (C22c2 & d2).

(C10r1) Use only Pyroxylin Paste Wood Filler or Paste Wood Filler reduced with lacquer thinner under lacquer finishes.

(C10s) Berrywax (B. B.)

Note: A high grade floor wax. For application see (C22d4).

(C10t) Lacklustre (B. B.)

Note: See (A9) Page 3. An economical combined stain and finish used in lieu of stain, shellac and wax. For application see (C19g2).

(C10u) VARNISHES

(C10u1) Berry Spar (Gloss) (B. B.)

Note: See (A10a) Page 3. A quick drying moisture-proof spar varnish for exterior and interior use. For application see (C18c5 & c6) (C19e3 & f5).

(C10u2) Luxeberry Wood Finish (Gloss) (B. B.)

(a) To produce Semi-gloss, mix Gloss (1 part) and Dull (3 parts).

Note: See (A10b) Page 3. A light colored interior rubbing varnish of highest quality. For application see (C19f7 & f11).

(C10u4) Liquid Granite Floor Varnish (Gloss) (Dull) (Quick Drying) (B. B.)

(a) To produce Semi-gloss, mix Gloss (1 part) and Dull (3 parts).

Note: See (A10c) Page 3. A floor varnish of the highest quality. Known as "The Million-step-test floor varnish." Use also for standing trim to take severe wear. For application see (C18c7) (C19e3, e4, f6, f8, f10 & g3) (C22c4 & c6).

(C10v) LACQUERS (CLEAR SPRAYING)

(C10v1) No. 364 Berryloid Clear (Gloss) (B. B.)

Note: See (A11a) Page 3. Clear gloss for interior cabinet finish. Can be rubbed. For application see (C19h6 & h7).

(C10v2) No. 502 Semi-gloss Berryloid Clear (B. B.)

Note: See (A11b) Page 5. Clear semi-gloss to save the cost of rubbing. For application see (C19h8).

(C10v3) No. 398 Flat Berryloid Clear (B. B.)

Note: See (A11c) Page 5. Clear flat to save the cost of rubbing. For application see (C19h8).

(C10v4) No. 507 Berryloid Clear Exterior (Gloss) (B. B.)

Note: See (A11d) Page 5. Clear gloss for exterior use and for interior use where there is severe wear or moisture is prevalent. Can be rubbed. For application see (C18d4) (C19h5).

(C10w) ENAMELS

Note: See (C10k) for Lionoil Floor Enamel and (C10l) for Lionoil Metal Trim Enamel.

(C10w1) Berry's Enamel Undercoat (B. B.)

Note: See (A12a) Page 5. An opaque interior enamel undercoat of highest quality. For application see (C18e3) (C19i1 & i7) (C20b).

(C10w2) Luxeberry Enamel (Gloss) (Eggshell) (B. B.)

Note: See (A12b) Page 5. An interior rubbing enamel of highest quality. For application see (C18e4 & e5) (C19i3, i6 & i7) (C20b).

**(C10w3) Berrycraft Quick Drying Enamel (Gloss)
(B. B.)**

Note: (A12c) Page 5. A quality enamel for use where time is the element. For application see (C19i4).

(C10w4) Berry's Radiator Enamel (Flat) (B. B.)

Note: See (A12d) Page 5. A special heat resisting flat radiator enamel. For application see (C21c).

(C10x) PLASTER PAINTS

(C10x1) Berryflat (Eggshell) (B. B.)

Note: See (A13a) Page 5. A high grade semi-flat wall paint. For application see (C20d).

(C10x2) Delitone and Delitone Thinner (Semi-gloss) (B. B.)

Note: See (A13b) Page 5. A semi-gloss wall paint of high quality. For application see (C20c).

**(C11) EXTERIOR AND INTERIOR PAINTING AND FINISHING
OF STEEL, IRON, ETC.**

(C11a) For previous painting at shop and in the field see (give paragraph and page references).

Note: Shop and field coats of Lionoil Colored provides exceptional protection.

(C11b) Over shop or field coats previously applied, all exposed surfaces of the following items shall be finished as specified below:

Note: Here list items such as exposed steel work columns, trusses, etc.; cast iron and steel stairs; fire escapes, wrought iron and pipe rails; exposed lintels, etc. Where there are a variety of classes or groups of work each requiring a different finish, precede each group with clause (C11b) and list separately followed by the particular specification which applies.

Note: Specifications are listed in the general order of desirability, the highest grade first. Select that adapted to the particular work.

(C11c) Two (2) coats of Lionoil Metal Trim Enamel (Exterior) (and) (Interior). Allow not less than 10 hours to dry hard between coats.

(C11d) Two (2) coats of Lionoil Colored. Allow not less than 12 hours to dry hard between coats.

(C11e) Verde Antique Finish—Two (2) coats of Lionoil Colored (Brown) over which apply a glazing coat of Lionoil Light Green, which when partially set shall be partly removed by wiping off or "patting" with a pad of knit cotton goods to imitate Verde Antique Bronze. Allow not less than 12 hours to dry hard between coats. Finish with one (1) coat of Liquid Granite Dull.

BERRYCRAFT HOUSE PAINT
14-color Assortment

Also Outside White (Gloss)—Inside White (Flat)—Jet Black.

Colors marked * are higher in price.

(C12) EXTERIOR AND INTERIOR PAINTING AND FINISHING OF STEEL WINDOWS

(C12a) For previous painting at shop (and in the field) see (give paragraph and page reference).

Note: Steel windows should be painted in the field after erection, before glazing. This frequently is done by the erector in which case specify the same material as specified for finish reducing the finish by one (1) coat.

(C12b) Over shop or field coats previously applied, the following items shall be finished as specified below:

Note: Here list items. Where there are a variety of classes or groups each requiring a different finish, precede

each group with clause (C12b) and list separately followed by the particular specification which applies.

Note: Specifications are listed in the order of desirability, the highest grade first. Select that adapted to the particular work.

(C12c) Two (2) coats of Lionoil Metal Trim Enamel, Exterior and Interior as adapted. Allow not less than 10 hours to dry hard between coats.

(C12d) Two (2) coats of Lionoil Colored. Allow not less than 12 hours to dry hard between coats.

(C13) EXTERIOR AND INTERIOR PAINTING AND FINISHING OF SHEET METAL WORK

(C13a) For previous painting at shop (and in the field) see (give paragraph and page reference).

Note: Shop and field coats of Lionoil Colored provides exceptional protection.

(C13b) All exposed surfaces of the following items shall be finished as specified below:

Note: Here list items such as roofing, flashing, ventilators, skylights, sheet metal windows, steel smoke stacks, etc. Where a variety of classes or groups of work each requiring a different finish, precede each group with clause (C13b) and list separately followed by the particular specification which applies.

Note: Specifications are listed in the general order of desirability, the highest grade first. Select that adapted to the particular work.

(C13c) Two (2) coats of Lionoil Metal Trim Enamel (Exterior) (and) (Interior). Allow not less than 10 hours to dry hard between coats.

Note: Particularly advocated for interior exposed sheet metal work and both exterior and interior of Sheet Metal Windows.

(C13d) Two (2) coats of Lionoil Colored. Allow not less than 12 hours to dry hard between coats.

(C14) EXTERIOR AND INTERIOR PAINTING AND FINISHING OF METAL DOORS AND TRIM

(C14a) For previous painting at shop (give paragraph and page reference).

Note: A shop coat of Lionoil Colored provides exceptional protection.

(C14b) Over shop coat previously applied, all exposed surfaces of metal doors (including tops and bottoms) and trim shall be finished as specified below.

Note: Here list items by numbers, reference to schedules, or otherwise.

Note: Specifications are listed in order of desirability, the highest grade first. Select that adapted to the particular work.

(C14c) Two (2) coats of Lionoil Metal Trim Enamel (Exterior) (and) (Interior). Allow not less than 10 hours to dry hard between coats.

(C14d) Two (2) coats of Lionoil Colored. Allow not less than 12 hours to dry hard between coats.

Note: Adapted to industrial and similar work.

(C15) EXTERIOR AND INTERIOR PAINTING AND FINISHING OF CEMENT, CEMENT STUCCO, CONCRETE AND BRICK

(C15a) Treat all wall surfaces of (cement) (concrete) (brick) with a wash consisting of 4 lbs. of zinc sulphate crystals to the gallon of water. After the walls are dry, all loose crystals must be removed with a brush.

Note: Advocated if alkali is especially strong.

(C15b) **Note:** If walls have been previously finished include clauses (C8g2) and (C8g4).

(C15c) The following surfaces shall be finished as specified below.

Note: Here list surfaces to be finished such as exterior stucco, cement or concrete work, brick, etc., in light courts and interior walls and ceilings.

(C15d) Two (2) coats of Luxeberry Cement Coating

applied with a (brush) (spray). Allow not less than 8 hours to dry hard between coats.

Note: Use where a flat finish is desired.

(C15e) One (1) coat of Luxeberry Cement Coating and one (1) coat of Lionoil Floor Enamel—Quick Drying each applied with a (brush) (spray). Allow not less than 8 hours to dry between coats.

Note: Use where a gloss finish is desired.

(C15f) Two (2) coats of Lionoil Colored, the first coat reduced with a gallon of Lionoil "Clear" to the gallon of Lionoil "Colored." Apply with a (brush) (spray). Allow not less than 12 hours to dry between coats.

Note: Use where a semi-gloss is desired.

(C16) (INDUSTRIAL BUILDINGS) INTERIOR PAINTING AND FINISHING OF WOOD, BRICK, CONCRETE AND PLASTER

(C16a) Treat all wall surfaces of (cement) (concrete) (plaster) (brick) with a wash consisting of 4 lbs. of zinc sulphate crystals to the gallon of water. After the walls are dry, all loose crystals must be removed with a brush.

Note: Advocated if alkali is especially strong.

(C16b) **Note:** If walls have been previously finished include clauses (C8g2) and (C8g4).

(C16c) The following surfaces shall be finished as specified below:

Note: Here list interior surfaces to be finished such as wood columns, beams and ceilings in mill construction; brick walls; concrete walls, columns, beams and ceilings; and plaster walls and ceilings.

(C16d) (One (1)) (two (2)) coats of Berry Brothers Mill White applied with a (brush) (spray). Allow not less than 24 hours to dry between coats.

(C17) FINISHING CONCRETE FLOORS AND BASES

(C17a) The following concrete floors shall be finished as specified below:

Note: List and locate.

Note: Specifications below are listed in the order of durability, the highest first.

(C17b) One (1) coat of Lionoil Clear, one (1) coat of Luxeberry Cement Coating finished with two (2) coats of

Lionoil Floor Enamel—Quick Drying. Allow not less than 12 hours to dry between all coats except last two where not less than 4 hours is required.

(C17c) One (1) coat of Luxeberry Cement Coating and (one (1)) (two (2)) coat (s) of Lionoil Floor Enamel—Quick Drying. Allow not less than 12 hours to dry between coats except Lionoil Floor Enamel—Quick Drying where not less than 4 hours is required.

(C18) EXTERIOR PAINTING AND FINISHING OF WOOD

(C18a) The following exterior woodwork shall be finished as specified below:

Note: Here list items such as exterior woodwork trim, siding, exterior wood window and door frames, exterior side of wood sash and doors, porch floors, etc., and name the wood to be finished. Where there are a variety of classes or groups of work each requiring a different finish, precede each group with clause (C18a) and list separately followed by the particular specification which applies.

(C18b) PAINT FINISH

(C18b1) Prime all woodwork to be painted with priming paint before or immediately after erection.

(C18b2) This shall include the priming of all backs or unexposed parts of window and door frames.

(C18b3) Prime the pulley stiles and parting beads of double hung wood window frames with a coat of Lionoil Clear only.

(C18b4) Finish exterior wood floors with one (1) coat of Lionoil Clear and two (2) coats of Lionoil Floor Enamel—Quick Drying. Allow not less than 12 hours to dry between first and second coats and not less than 4 hours between the last two coats.

(C18b5) Over the priming coat finish with

Note: Specifications below are listed in the general order of desirability, the highest grade first. Select that adapted to the particular work.

(C18b6) Two (2) coats of Berrycraft House Paint.

(C18b7) Two (2) coats of Lead and Oil Paint.

(C18c) VARNISH OR NATURAL FINISH

(C18c1) Stain with (oil) (acid) stain. Allow sufficient time to thoroughly dry.

Note: Omit on natural finish.

(C18c2) Fill with paste wood filler. Allow not less than 8 hours (more if necessary) to set hard.

Note: Omit ordinarily on close-grain wood (see C9d).

(C18c3) Over (stain) (and) (filler) apply a thin coat of (SDC-orange) (SDC-white) shellac and sand lightly.

(C18c4) Finish with

Note: Specifications below are listed in the general order of desirability, the highest grade first. Select that adapted to the particular work.

(C18c5) (Two (2)) (three (3)) coats of Berryspar. Allow not less than 8 hours to dry between coats.

(a) The last coat shall be rubbed to a dull finish.

(C18c6) One (1) coat of Lionoil Clear over which shall be applied (one (1)) (two (2)) coats of Berryspar. Allow not less than 8 hours to dry between coats.

(C18c7) Two (2) coats of Lionoil Clear and two (2) coats of Liquid Granite Floor Varnish (Quick Drying) Dull. Allow not less than 8 hours to dry between coats.

Note: An excellent finish for half timber work, and similar natural or stained exterior woodwork trim; porch ceilings, etc.

(C18d) CLEAR SPRAYING LACQUER FINISH

(C18d1) Stain with acid stain. Allow sufficient time to thoroughly dry.

Note: Omit on natural finish. Use only acid stains under lacquer.

(C18d2) Fill with paste wood filler. Allow from 24 to 36 hours to set hard.

Note: Omit on close-grain wood. Use only Pyroxylin Filler.

(C18d3) Over (stain) (and) (filler) apply a spray coat of Lionoil Clear. Allow not less than 12 hours to dry or completely oxidize before lacquer is applied.

(C18d4) Finish with (two (2)) (three (3)) coats of No. 507 Berryloid Clear Exterior, spray applied. Allow not less than 1 hour to dry between coats.

(C18d5) The last coat shall be allowed to dry for at least 5 hours and shall then be rubbed to a dull finish.

(C18e) ENAMEL FINISH

(C18e1) Prime all woodwork to be enameled with equal parts of Berryflat and Lionoil Clear priming coat.

(C18e2) **Note:** If exterior window frames and trim are enameled include clauses (C18b2) and (C18b3).

(C18e3) Over the priming coat, apply two (2) coats of Berry's Enamel Undercoat. Allow not less than 8 hours to dry between coats.

(C18e4) Over undercoats apply (two (2)) (three (3)) coats of Luxeberry Enamel Gloss. Allow not less than 3 days to dry between coats.

(C18e5) The last coat shall be rubbed to a dull finish.

(C18e6) Over undercoats apply (one (1)) (two (2)) coats of Luxeberry Enamel, Gloss, finished with (one (1) coat of Luxeberry Enamel Eggshell) (one (1) coat consisting of equal parts of Berry Enamel Undercoat and Luxeberry Enamel Gloss).

Note: Choose finish coat. Either produces an eggshell finish without rubbing.

(C19) INTERIOR PAINTING AND FINISHING OF STANDING WOODWORK

(C19a) The following interior woodwork shall be finished as specified below.

Note: Here list items of standing woodwork trim, etc., and name the wood to be finished. Where there are a variety of classes or groups of work each requiring a different finish, precede each group with clause (C19a) and list separately followed by the particular specification which applies.

(C19b) BACK PAINTING, SHELVING, INSIDE OF DRAWERS, CUPBOARDS, ETC.

(C19b1) The unexposed back of all standing interior wood-

work coming in contact with plaster shall be given (one (1)) (two (2)) coats of (Lionoil Clear) (Berrycraft House Paint priming coat) (Lead and oil priming coat).

(C19b2) The inside of all (drawers) (cupboards) and all shelving shall be given (one (1)) (two (2)) coats of Lionoil Clear.

(C19b3) After wood doors have been fitted and hung give the tops and bottoms two (2) coats of Lionoil Clear.

(C19c) PRIMING

(C19c1) Prime all wood work to be (painted) (and) (enameled) with priming paint before or immediately after erection.

(C19d) PAINT FINISH

(C19d1) Over the priming coat, finish with

(C19d2) Two (2) coats of Lionoil Floor Enamel (*Quick Drying*). Allow not less than 4 hours to dry between coats.

(C19d3) Two (2) coats of Berrycraft House Paint.

(C19d4) Two (2) coats of Lead and Oil Paint.

(C19e) GRAINING

Note: Particularly for the interior of soft wood sash to match hard wood interior trim.

(C19e1) Over the priming coat, give one coat of (*Lionoil (Colored)*) (*Berrycraft House Paint*) (*Lead and Oil Paint*) ground color over which, when thoroughly dry, apply one (1) coat of graining color combed to the desired effect.

(C19e2) Finish with

(C19e3) (*Two (2)*) (*three (3)*) coats of (*Berryspar*) (*Liquid Granite Floor Varnish [Quick Drying] Gloss*), the last coat rubbed to a dull finish. Allow not less than 24 hours (*4 hours for Quick Drying*) to dry between coats.

(C19e4) (*One (1)*) (*two (2)*) coats of Liquid Granite Floor Varnish Gloss finished with one (1) coat of Liquid Granite Floor Varnish (*Dull*) (*Semi-gloss*). Allow not less than 24 hours (*4 hours for "Quick Drying"*) to dry between coats.

(C19f) VARNISH FINISH

(C19f1) Stain with (*oil*) (*acid*) stain.^c Allow from 24 to 36 hours to dry.

Note: Omit on natural finish.

(C19f2) Fill with paste wood filler. Allow from 24 to 36 hours to set hard.

Note: Omit on close-grain wood.

(C19f3) Over (*stain*) (*and*) (*filler*) apply a thin coat of (*SDC-orange*) (*SDC-white*) shellac and sand lightly.

(C19f4) Finish with

Note: Specifications below are listed in general order of durability or desirability, the highest grade first. Select that adapted to the particular work.

(C19f5) (*Two (2)*) (*three (3)*) coats of Berryspar. Allow not less than 8 hours to dry between coats.

(C19f6) (*Two (2)*) (*three (3)*) coats of Liquid Granite Floor Varnish Gloss (*Quick Drying*). Allow not less than 12 hours (*4 hours for "Quick Drying"*) to dry between coats.

Note: Use the two above particularly where moisture must be guarded against. Use Liquid Granite wherever the hardest service is required.

(C19f7) (*Two (2)*) (*three (3)*) coats of Luxeberry Wood Finish Gloss. Allow not less than 12 hours to dry between coats.

Note: All of the above are in gloss varnish requiring rubbing for the finest finish.

(C19f8) (*Two (2)*) (*three (3)*) coats of Liquid Granite Quick Drying Varnish (*Gloss*) (*Dull*). Allow not less than 4 hours to dry between coats.

(C19f9) The last coat shall be rubbed to a dull finish.

Note: The gloss requires rubbing for the finest finish. The dull provides a semi-gloss or dull without rubbing.

(C19f10) (*One (1)*) (*two (2)*) coats of Liquid Granite Gloss finished with a coat of Liquid Granite Floor Varnish (*Dull*) (*Semi-gloss*) (*Quick Drying*). Allow not less than 12 hours to dry between coats.

(C19f11) (*One (1)*) (*two (2)*) coats of Luxeberry Wood Finish Gloss finished with one (1) coat of Luxeberry Wood Finish (*Dull*) (*Semi-gloss*). Allow not less than 12 hours to dry between coats.

Note: The above two provide a dull or semi-gloss finish without rubbing.

(C19g) COMBINED STAIN AND FINISH

Note: For Mission or Weathered effects.

(C19g1) The following interior woodwork shall be finished as specified below:

Note: Here list items.

(C19g2) Apply one (1) coat of Lacklustre with a pad of cheese cloth about the size of a hand sponge, or with a brush. Cover only a small section at a time, such as a panel, etc., then wipe off with a clean piece of cheese cloth, rubbing first across the grain, then with the grain leaving a dull polish.

(C19g3) Over the Lacklustre apply one (1) coat of Liquid Granite Floor Varnish Dull (*Quick Drying*).

Note: Use where severe wear is to be encountered.

(C19h) CLEAR SPRAYING LACQUER FINISH

(C19h1) Stain with acid stain. Allow sufficient time to thoroughly dry.

Note: Omit on natural finish. Use only acid stains under lacquer.

(C19h2) Fill with paste wood filler. Allow from 24 to 36 hours to set hard.

Note: Omit on close-grain wood. Use only Pyroxylin Filler.

(C19h3) Over (*stain*) (*and*) (*filler*) apply a thin spray coat of Lionoil Clear. Allow not less than 24 hours to dry or completely oxidize before lacquer is applied.

(C19h4) Finish with

Note: Specifications below are listed in general order of durability or desirability, the highest grade first. Select that adapted to the particular work.

(C19h5) (*Two (2)*) (*three (3)*) coats of No. 507 Berryloid Clear Exterior, spray applied. Allow not less than 1 hour to dry between coats.

Note: The above particularly where severe wear or moisture must be guarded against.

(C19h6) (*Two (2)*) (*three (3)*) coats of No. 364 Berryloid Clear, spray applied. Allow not less than 1 hour to dry between coats.

(C19h7) The last coat shall be allowed to dry for at least 5 hours and shall then be rubbed to a dull finish.

Note: The above two are in gloss finish requiring rubbing for the finest finish.

(C19h8) (*One (1)*) (*two (2)*) coats of No. 364 Berryloid Clear finished with one (1) coat of (*No. 502 Semi-gloss Berryloid Clear*) (*No. 398 Flat Berryloid Clear*) spray applied. Allow not less than 1 hour to dry between coats.

Note: Use where rubbing is impractical on carvings, mouldings, etc. Provides an eggshell or soft semi-gloss finish. Samples on request.

(C19i) ENAMEL FINISH

(C19i1) Over the priming coat, apply two (2) coats of Berry's Enamel Undercoat. Allow not less than 8 hours to dry between coats.

(C19i2) Finish with

Note: Specifications below are listed in general order of durability or desirability, the highest grade first. Select that adapted to the particular work.

(C19i3) (*Two (2)*) (*three (3)*) coats of Luxeberry Enamel Gloss.

(C19i4) (*Two (2)*) (*three (3)*) coats of Berrycraft Quick Drying Enamel.

(C19i5) The last coat shall be rubbed to a dull finish.

Note: The above two are in gloss enamel requiring rubbing for the finest finish.

(C19i6) (*One (1)*) (*two (2)*) coats of Luxeberry Enamel Gloss finished with one (1) coat of Luxeberry Enamel Eggshell.

(C19i7) (*One (1)*) (*two (2)*) coats of equal parts of Luxeberry Enamel and Berry's Enamel Undercoat.

Note: The above two provides an eggshell or soft semi-gloss finish without the expense of rubbing.

(C20) PAINTING AND FINISHING OF INTERIOR PLASTER WALLS AND CEILINGS

Note: See also (C15) and (C16).

(C20a) The following interior plaster walls and ceilings shall be finished as specified below:

Note: Here list items and state whether sand float or hard (putty coat) finish. Where there are a variety of classes or groups of work each requiring a different finish, precede each group with clause (C20a) and list separately followed by the particular specification which applies.

Note: Specifications below are listed in order of durability or desirability. Select that adapted to the particular work.

(C20b) One (1) sizing coat consisting of one (1) part of Lionoil Clear to one (1) part of Berry's Enamel Undercoat applied with a (brush) (spray), over which apply (one (1)) (two (2)) coats of Berry's Enamel Undercoat, finished with (two (2)) (three (3)) coats of Luxeberry Enamel (Gloss) (Eggshell). Allow not less than 12 hours to dry between coats. Recoat flat spots appearing after first coat before the application of second coat.

Note: For the highest class of enameled wall finish.

(C20c) One (1) coat consisting of equal parts of Delitone and Delitone Thinner applied with a (brush) (spray) over which apply with a (brush) (spray) a finish coat consisting of Delitone reduced with 1½ pints of turpentine and ½ pint of Delitone

Thinner to the gallon of Delitone. Allow not less than 24 hours to dry between coats. Recoat any flat spots appearing after first coat before the application of the second coat.

(C20d) One (1) sizing coat consisting of one (1) part of Lionoil Clear to one (1) part of Berryflat applied with a (brush) (spray), over which apply with a (brush) (spray) (one (1)) (two (2)) coats of full body Berryflat. Allow not less than 12 hours to dry between coats. Recoat any flat spots appearing after first coat before the application of the second coat.

(C20e) After the finish coat has set from 20 to 30 minutes, stipple with a stippling brush to a uniform mat finish.

Note: Either of the above finishes takes an excellent stipple.

(C20f) **Note:** Where desired over-glazes, sponge-stipples, etc., may be added. If required, specify here.

(C20g) (Two (2)) (three (3)) coats aluminum paint consisting of 1¼ lbs. of aluminum bronzing powder to the gallon of Berry Brother's Aluminum Paint Liquid No. 3 applied with a (brush) (spray).

Note: An especially durable, cleanable, light reflecting surface for use in elevator shafts, boiler and fan rooms, etc., and industrial buildings.

(C21) PAINTING AND FINISHING OF RADIATORS, ETC.

(C21a) The following radiation (and exposed piping) shall be finished as specified below:

Note: Here list items.

(C21b) Apply with a (brush) (spray) one (1) coat of aluminum paint consisting of 1¼ lbs. of aluminum bronzing powder to a gallon of Berry Brother's Aluminum Paint Liquid No. 3. Allow not less than 8 hours to dry.

Note: Advocated to produce a clean smooth surface for enamel finish. This is often included under the Heating Specification and if so, omit here.

(C21c) (Over the aluminum bronze coat) apply (one (1)) (two (2)) coats of Berry's Radiator Enamel. Allow not less than from 6 to 8 hours to dry between coats.

(C22) PAINTING AND FINISHING OF INTERIOR WOOD FLOORS

(C22a) The following interior wood floors shall be finished as specified below:

Note: Here list floors and name the wood to be finished. Where there are a variety of classes or groups of floors each requiring a different finish, precede each group with clause (C22a) and list separately followed by the particular specification which applies.

(C22b) PAINT FINISH

(C22b1) Prime the floors with Lionoil Colored priming paint over which apply two (2) coats of Lionoil Floor Enamel—Quick Drying. Allow not less than 8 hours to dry between the first and second coats and not less than 4 hours between the last two coats.

(C22c) VARNISH FINISH

(C22c1) Stain with (oil) (acid) stain. Allow sufficient time to thoroughly dry.

Note: Omit on natural finish.

(C22c2) Fill with paste wood filler. Allow not less than 8 hours (more if necessary) to set hard.

Note: Omit on close-grain wood.

(C22c3) Finish with

Note: Specifications below are listed in general order of durability or desirability, the highest grade first. Select that adapted to the particular work.

(C22c4) Apply one (1) coat of Lionoil Clear followed by (two (2)) (three (3)) coats of Liquid Granite Floor Varnish Gloss (Quick Drying).

(C22c5) The last coat shall be rubbed to a dull finish.

Note: The above is gloss varnish requiring rubbing for the finest finish.

(C22c6) Apply one (1) coat of Lionoil Clear followed by (one (1)) (two (2)) coats of Liquid Granite Gloss, finished with one (1) coat of Liquid Granite Floor Varnish (Dull) (Semi-gloss) (Quick Drying).

Note: The above provides a dull or semi-gloss finish without rubbing.

(C22d) WAX FINISH

(C22d1) Stain with (oil) (acid) stain. Allow sufficient time to thoroughly dry.

Note: Omit on natural finish.

(C22d2) Fill with paste wood filler. Allow not less than 8 hours (more if necessary) to set hard.

Note: Omit on close-grain wood.

(C22d3) Over the (stain) (and) (filler) apply a thin coat of (SDC-orange) (SDC-white) shellac and sand lightly.

(C22d4) Over shellac apply two (2) coats of Berrywax, each polished hard with a weighted floor brush.

(C22e) OIL FINISH

(C22e1) Apply (two (2)) (three (3)) coats of Lionoil Clear with a (brush) (mop). Allow not less than 12 hours to dry between coats.

Note: Floors finished with Lionoil Clear retain their natural color and will not darken as with linseed oil. It costs no more than the application of hot linseed oil and turpentine. It penetrates deeply, gives unusual service and is waterproof.

CERTAIN-TEED INTERIOR and EXTERIOR HOUSE OIL STAINS, SHINGLE STAINS, VARNISHES, LACQUERS
PAINTS, FLAT WALL PAINTS, ENAMELS, KALSOMINE, and FLOOR PAINTS.

CERTAIN-TEED PAINT, ENAMEL, STAIN AND VARNISH PRODUCTS

Certain-teed paints, enamels, stains and varnishes include finishes for practically every interior and exterior purpose. This line represents highest quality—the direct result of care exercised by experts in the selection of raw materials and in the process of manufacture.

TRADE-MARK

Certain-teed paint and varnish products enjoy a country-wide reputation that has been built up through years of satisfactory service. Architects specify Certain-teed products because successful results bespeak good judgment in the wise selection of materials.

No. 448 Outside White

What is inside the paint can labeled No. 448 Outside White? In each can of No. 448 Outside White

(1) Just enough to dry the paint; not enough to burn it up.
(2) Pure distilled. Insures bonding between coats and prevents peeling.

(3) Aged and refined. Tested for absolute purity and freedom from the destructive "foots" found in cheaper linseed oils not aged. Enough used to thoroughly saturate and coat each particle of pigment. More oil would lower the cost, but sacrifice durability.

(4,5) A great deal of the durability comes from this small 6.8%. It adds "tooth" for bonding between coats, and helps prevent chalking and cracking because of the reinforcing action. Also prevents settling in the can.

(6) Finest American Process for durability. Just enough used to harden the film and retard chalking. A greater percentage would cause objectionable cracking. Mainly responsible for the extreme whiteness of No. 448.

(7) Practically the same properties as basic lead carbonate, except that it absorbs much more oil. If it were used altogether, there would be insufficient lead. The 12.4% brightens the color, increases the resistance to sulfur gases, and lessens settling.

(8) The "back bone" of No. 448 is the best Old Dutch Process Corroded White Lead Carbonate. Because of the protective and easy brushing properties of this pigment, as large a percentage as possible is used, compatible with durability and non-settling. All other ingredients are used to abet and protect it so that it will remain on the surface for the greatest length of time. That is one of the reasons why No. 448 is superior to a paint made entirely from keg white lead by the painter. An all-lead paint would cost less—but it would be inferior.

there are 18 lbs. of the finest, purest ingredients scientifically combined to form this extra heavy, highly superior house paint. There is a reason—and a good one—for each ingredient used in this paint. There is also a good reason for using an exact percentage of that ingredient.

Certain-teed House Paint (Exterior and Interior)

Exact combinations of the best ingredients, tested by expert chemists, precision in grinding and mixing, assure a superior product. It possesses durability, uniformity and permanence of colors. Spreads easily, covers generously, and keeps the ultimate cost of painting low when the expense of labor is compared with the cost of material over a period of years.

Certain-teed House Paint comes in liquid, paste and semi-paste form. The covering capacity is approximately 350 sq. ft. per gallon, two coats, depending on the surface.

Specifications—Exterior Paint—All exterior paint shall be Certain-teed House Paint and shall be delivered at the building in the manufacturer's original packages, unopened until inspected by the architect or his representative. Paint shall be of the colors selected. All paint from priming to finish coat shall be used and applied strictly according to the directions of the manufacturer on the container and thinned only as allowed.

New Work—Exterior finished woodwork shall be given coats well brushed on, sufficient time being allowed between coats to allow the paint to dry thoroughly. All knots and sappy places shall be given a coat of shellac before applying the priming coat.

Old Work—All old woodwork shall be given coats of paint of color selected. All old surfaces shall be thoroughly dusted and cleaned. Any loose particles of paint or bubbles shall be removed and surface rubbed with wire brush before applying first coat.

Certain-teed Flat Wall Paint

A practical beautiful flat wall finish of the very best quality. It is soft and restful to the eyes, and free from even a suggestion of gloss or glare. Widely used in public buildings, office buildings, schools, homes, etc. It may be used on wood, metal ceilings, wall boards, etc., as well as for plastered walls and ceilings. It is sanitary and germproof, and the painted surfaces may be washed with soap and water.

Widely used as an undercoating for enamel finishes.

Covering Capacities—The covering capacity will vary according to the condition of the surface.

One gallon will cover with one coat approximately as follows:

On smooth plaster, metal ceilings and painted smooth surfaces, 700 to 800 square feet.

On rough plaster, wall board and over wallpaper or burlap 500 to 600 square feet.

Where wall size is mixed with the paint, estimate about 500 square feet per gallon, one coat.

Application—No size is needed on unpainted woodwork or metal ceilings. Sizing is required for new plaster work and for wall board. For old plaster kalsomined, wash off kalsomine or if it is tight, give one coat of Certain-teed Wall Size.

Specifications—All wall paint shall be Certain-teed Flat Wall Paint used from the original containers and applied as per direction of manufacturer printed on the label of container.

All new plaster shall be clean and dry before applying one coat of Certain-teed Wall Size. All cracks in old work are to be filled with plaster of paris before applying size. All new plaster shall be given two coats of Flat Paint and old plaster shall be given one coat, unless undercoat is considerably darker than new color. The walls and ceilings of the following rooms shall be stippled in the second coat, which shall be Certain-teed Flat Wall Paint.

Certain-teed Mill White

A sanitary light reflecting finish for interior walls and ceilings of factories, shops, industrial plants, schools, office buildings, etc. Certain-teed Mill White is a durable oil paint, not a cold water paint, and will not wash off. It can be used on wood, plaster or brick surfaces. Has minimum of yellowing tendency and may be washed with soap and water. Made in flat and gloss finishes. The gloss finish has the greatest light reflecting properties, but does not produce a glare. Its smooth surface resists dust and dirt, and is more easily cleaned than the flat finish.

Soap or washing powder will not injure it. It is white when applied and stays white in use, thus overcoming the serious loss in lighting value encountered in finishes which yellow with age, readily catch dirt or rub off.

Specifications—The ceilings and walls of shall be painted with Certain-teed Mill White Paint. Where one coat is required, this shall be the gloss finish, but where two coats are required, the first coat shall be Certain-teed Mill White (Flat) Paint and the second coat shall be Certain-teed Mill White (Gloss) Paint. All paint shall be used from the manufacturer's original container and only as prescribed by the directions on the container. Old walls and ceilings painted white and not very soiled, shall be given one coat of gloss finish. New work shall be given two coats.

Certain-teed Decorative Enamel

A decorative enamel suitable for the very best architectural work. We have perfected this enamel to

meet the modern requirements for easy brushing, self-leveling and a high gloss porcelainlike finish. This is a long oil enamel and is much more satisfactory for every purpose than enamels made with a varnish base, which are difficult to apply—pulling under the brush, sagging and curtaining, and not very white in color.

Made from the finest quality ingredients, the very best and whitest zinc oxide (French Process White Seal) and specially prepared oils. It will stay white indefinitely.

One gallon will cover 600 sq. ft. of surface, one coat. It dries in 36 hours. Made in both gloss and eggshell finishes. For the most satisfactory results, Certain-teed Enamel First Coater should be used for the undercoats.

Specifications—

Priming Coat—Apply two coats of Certain-teed Enamel First Coater as directed on the label of container, sandpapering each coat lightly with 00 sandpaper before applying next coat. If enamel is to be tinted, the second coat shall be colored to about the same shade as the enamel.

Finishing Coats—Two coats of enamel shall be applied using enamel of kind selected or tinted, as directed. The first coat shall be sanded lightly with 00 sandpaper before applying the finish coat. The second coat to be left with glossy finish. Should a semi-gloss, sheen or an eggshell finish be desired, use Certain-teed Eggshell Enamels or rub glossy finish to an eggshell with pumice and water.

Certain-teed Quick Drying Enamel

This popular enamel is ideal for finishing and decorating because it dries within four hours—from surface to bottom. This means saving time on the job and a reduction in labor costs.

Certain-teed Quick Drying Enamel dries with a beautiful high gloss that is exceptionally durable. This product contains the best grades of material, and is manufactured under the supervision of skilled workmen. It is available in many attractive colors for interesting decorative effects.

One coat of the quick drying enamel is usually sufficient over surfaces previously enameled or painted. Two coats are needed over new surfaces. The second coat may be applied on the same day as the first, since this enamel dries hard in about four hours.

Certain-teed Penetrating Oil Stains

Highest quality penetrating oil stains for interior finishing on either hard or soft woods. They are in liquid form and penetrate deeply, but do not raise the grain of the wood. As they are clear and transparent, they show off the grain of the wood. Open grain woods must be filled over the stain and given time to dry before being shellacked. As the color of the stain will vary on different woods, because of the nature and color of the wood itself, samples of the stained finishes should be required before proceeding with the work. Covering capacity, 800 to 1000 sq. ft. per gallon, one coat, depending upon the wood to be stained. May be applied with a soft cloth or a brush.

Specifications—Apply one brush coat of No. . . . Certain-teed Penetrating Oil Stain. Allow stain to remain for one or two minutes, then wipe off with a rag. If not dark enough, apply second coat and wipe off. Stain to be equalized as the grain of the wood requires. Allow 24 hours for the stain to dry before filling and shellacking. Colors are to be selected by the architect and samples of finish shall have his approval before proceeding with the work.

Certain-teed Shingle Stain

For shingles, rough timber construction and for all wood surfaces not previously painted. This stain is a product of the highest quality in which the proper mixture of pigments and oils necessary to give a permanent color are added. Applied either by brushing or dipping. We recommend dipping and the application of one brush coat as soon as laid; this requires $3\frac{1}{2}$ gal. to cover 1000 shingles. For dipping 1000 shingles, $2\frac{1}{2}$ gal. are required. To brush-coat shingles on roof, 1 gal. covers approximately 150 sq. ft. on the first coat and approximately 300 sq. ft. on the second coat.

Specifications—

Shingles, Dipped—All shingles shall be dipped two-thirds their length in Certain-teed Shingle Stain No. Shingles shall be dipped in and out of the stain rapidly and then set to drain and the surplus stain allowed to run into the container. Shingles shall be permitted to absorb the stain. Shingles must be dry when dipped.

Shingles, Brush Coated—Shingles shall be given two brush coats of Certain-teed Shingle Stain No. Stain butts and edges carefully. Stain shall be applied only when the shingles are dry.

Certain-teed Varnishes

Certain-teed Varnishes are unexcelled for quality and service. They successfully meet all the "freak" tests and the more important test of actual service. Extensive manufacturing facilities, high standard of quality, ample resources and the most competent technical skill combine to make them the best that can be manufactured. Covering capacity, all varnishes, about 600 to 700 sq. ft. per gallon, one coat.

Certain-teed Universal Varnish No. 900—For both exterior and interior use. Certain-teed Universal Varnish is made from the best grades of Congo gum, China wood oil, specially treated linseed oil, etc. The formula for making Certain-teed Universal is based upon many years of experience in varnish manufacture—extensive laboratory research and every conceivable test in actual use.

Certain-teed Universal is very pale in color—is heavy bodied, brushes easily, is self-leveling and dries quickly. A quality varnish that is built for sturdy endurance under all kinds of rough usage. For all interior and exterior work. Dries dust free in from 4 to 6 hours—hard overnight.

Certain-teed Outside Spar Varnish—A pale, extremely durable, highly lustrous varnish for all outside purposes, such as store fronts, outside doors, marine work and similarly exposed surfaces. Flowing, working, and wearing qualities unsurpassed. Will dry dust free in from 4 to 6 hours and hard overnight.

Certain-teed Interior Spar Varnish—This is a highest grade interior varnish for general use. It is not affected by contact with water. Has a durable and permanent gloss which can be rubbed to a dull finish and polished, if desired. Dries dust free in about 4 hours, and hard in 18 to 20 hours; rubbed in about 72 hours.

Certain-teed Quick Drying Varnish—This varnish meets a growing demand for a durable varnish that dries rapidly. It requires only 3 or 4 hours to

dry hard, from surface to bottom, furnishing a long-wearing, high gloss finish.

Heretofore, varnishes that dried quickly were not durable and lacked elasticity. Certain-teed Quick Drying Varnish possesses the desirable feature of quick drying without sacrificing its durability. The use of a special gum in making this varnish has resulted in a product that stands great wear. Three or four hours after applying the first coat, the second coat may be applied without causing peeling or impairing of the film.

Certain-teed Stucco and Cement Paint

A decorative and protective coating for concrete, cement, stucco, stone or brick—outside or inside use.

In residence work Certain-teed Stucco and Cement Paint is especially effective. The harshness of the raw stucco is mellowed to a warm, velvety matt finish, dusting and crumbling are retarded, and the danger of dampness in the wall structure, and the collection of soot, dirt, and rain streaking are minimized.

Seals the pores of the surface and prevents the absorption of moisture by forming a waterproof coating. Covers 150 to 300 sq. ft. per gallon, two coats, and dries in from 24 to 48 hours.

Certain-teed Cement Floor Paint

For preventing dusting, crumbling and disintegrating of cement floors. Very durable and furnishes a glossy damp-proof and sanitary surface on cement floors, which is easy to keep clean.

Covering capacity, approximately 500 sq. ft. per gallon, one coat. Dries in about 12 hours.

Two coats are recommended, allowing the first coat to become thoroughly dry.

Specifications—All cement floors must be dry, clean and free from all loose particles and grease before applying the paint.

When cement floor paint is to be used on new floors (that is floors laid less than 3 months) they must be treated with a coat of zinc sulphate solution, in the ratio of 3 lb. of zinc sulphate to the gal. of water, to neutralize any excess alkali, and allowed to dry thoroughly. For the best results, apply a coat of boiled linseed oil, and when thoroughly dry, apply two coats of cement floor paint as per directions of manufacturer.

Industrial Paints and Varnishes

In addition to a complete line of standard paints, varnishes, enamels, and stains, we manufacture every kind of related industrial finishes. Specifications are rigidly adhered to, and when supplied, samples will be matched exactly for color, uniformity and durability. Our Industrial Department is devoted to problems of this nature. It is composed of men, expert in their field, who are anxious to co-operate along every line.

Architects' Specifications

Complete Architects' Specifications for the application of paint and varnish, covering the extensive Certain-teed line, will be supplied upon request. These specifications cover every phase of the architect's problems in specifying the proper paints and varnishes, the varying conditions which will affect his decisions, and their proper applications.

Cabot's Creosote Shingle and Wood Stains

The first shingle stains ever made were invented
 by Samuel Cabot in 1882. They are now made by the
colloidal process, patented under the name of the Cabot
 Collopping Process, and are carried in colloidal solu-
 tion in Cabot's Creosote.

Uses—For coloring and preserving shingles, sid-
 ing boards, wood trimmings of cement houses, etc.

Coloring Effect—Owing to the colloidal process
 by which they are combined, the colors of Cabot's
 Stains are carried into the pores of the wood like dyes,
 giving a soft and velvety effect of great depth and rich-
 ness.

The tones are clear and transparent—the texture
 and grain of the wood are not affected. There is no
 gloss or shine. Colors guaranteed fast.

Wood Preservation—Creosote approximately
 doubles the life of wood. This is why it is used by all
 leading railroads for treating ties, posts, etc. Creosote
 protects wood against decay and insects.

Cabot's Creosote Shingle and Wood Stains

Cabot's Collopakes

Samuel Cabot
 Inc.

Covering Capacity—One
 gallon covers 100 sq. ft., 2 coats,
 on rough wood, or 200 to 250 sq.
 ft. on smooth wood; $2\frac{1}{2}$ to $2\frac{3}{4}$
 gal. will dip 1000 shingles two-
 thirds their length; 3 gal. will dip
 and brush-coat.

Special Colors—Special col-
 ors and shades will be made for
 architects who wish to produce
 special effects. Send samples to
 match or suggestions to follow.

Specification—All shingles and exterior woodwork
 are to be stained with Cabot's Stains in original pack-
 ages—the stain to be used without dilution. Shingles
 are to be dipped before laying, or dipped and brushed
 once after laying or brush-coated twice after laying.
 Other woodwork is to have two brush coats (three for
 hard close-grained or smooth wood). Apply to dry
 wood only. Colors to be selected by architects.

Cypress Shingles, Brick Chimneys and Stonework Finished
 with Cabot's Double-White; Roof in Blended Brown of
 Cabot's Creosote Shingle and Wood Stain

CLARK & ARMS, Architects, New York

Cabot's Interior Stains

Colloidal pigments made by the Cabot Collopping
 process with a lighter oil base for interior work only.
 All of the beauty and lasting quality of Cabot's Creosote
 Stains.

Cabot's Semi-flat Waterproof Collopakes

More fluid than paints, flow on the surface more easily, cost about one-third less, are more beautiful, more waterproof and more durable. The finish when dry is a beautiful semi-flat surface, preserving the texture of the surface.

Where to Use Them—On all new or painted, rough or dressed woodwork, on stucco, brickwork, concrete, stone, metal or prepared roofings.

Cabot's Old Virginia White, the White Semi-flat Collopake

It is a colloidal compound which faithfully reproduces the peculiarly desirable and soft, cool qualities of whitewash; but is finer in tone and texture, simple and easy to apply, clean and lasting.

Cabot's Gloss Collopakes

Made of the strongest and most permanent earth and mineral colors colloiddally compounded, i.e., pigments of submicroscopic fineness in colloidal solution. Ideal for blinds, shutters, doors and trimmings because they do not fade or grow lifeless with age, but retain their gloss and always remain fresh and lively. Have remarkable wearing quality as floor paints on both wood and concrete.

Made in pure greens that stay green, and a wide range in other colors.

Cabot's Double-White

A heavy white non-gloss collopake. Whiter than white lead and oil, it spreads more evenly and weathers flat. Is not affected by gases and light and is waterproof.

Uses—On all kinds of surfaces, including wood, brick, cement, and stucco.

Pre-revolutionary Residence of F. H. Beckwith, Architect, Bridgeport, Conn., Finished with Cabot's "Double-White"

Cabot's Interior Flat Waterproof Collopakes

Made by the patented Cabot Collopaking Process to improve the art of interior decoration. Show no brush marks, have greater hiding power, are flatter, have better priming and sizing properties and show less suction,

have greater reflecting power for light, have no tendency to collect dirt, are washable.

Go equally well on wood, plaster, stone, glass, stucco, or metal of any kind including metal ceilings where there is a particularly large use for them, and for mill and factory interiors. Made in a wide variety of colors.

Cabot's Clear Brick Waterproofing and Cabot's Clear Cement Waterproofing

Transparent liquid waterproofings applied to the surface with a brush. They penetrate and seal the pores, making the surface completely and permanently rainproof.

The clear brick waterproofing should be used only on dark colored brick or stone. For light colored surfaces the clear cement waterproofing should be used.

Piers, Hoboken, N. J., Waterproofed with Cabot's Clear Brick Waterproofing

Cabot's Conservo Wood Preservative

For preserving all kinds of woodwork from decay, worms, and insects.

Apply with a brush, as heavily as possible, or dip the lumber before using. Conservo gives a butternut brown tone.

Cabot's Dampproofing

For direct plastering on brick and concrete walls and stonebacking on marble and other delicate stones.

A permanently waterproof and adhesive coating that forms a perfect bond between the plaster and the wall, making furring and lathing unnecessary. It penetrates both plaster and wall, knitting them firmly and permanently together. It may be used for exterior work below grade.

Cabot's Flexiblac Protective Paint

A chemically pure black bitumen paint.

Cabot's Flexiblac will not oxidize, is not affected by acids or electrolysis, will not crack nor peel. It is permanent and a perfect protection, and costs only one-third as much as linseed oil paint.

Cabot's Germantown Lampblack

Pure lampblack which gives a cool gray tone to concrete sidewalks, floors and walls, and is much used for black mortar color.

Cabot's Mortar Colors

For 35 years the strongest and most durable colors for mortar.

Made in pulp form to insure uniform mixing and to save labor.

AN INTERIOR FLAT WHITE PAINT WITH 90% LIGHT REFLECTION

Description

Sunflex—an inside flat white paint for undercoating and finish coats. A time-tested product used by more and more architects on work that involves unusual conditions of application, service or cost. The following characteristics show why Sunflex is unique among paints.

Light Reflection

Sunflex with better than a 90% reflection of the light, rates as high if not higher than any other paint on this important point. Owners of buildings with Sunflex walls and ceilings report savings in lighting bills as high as 30%. Sunflex gives the highly desirable "mat" or diffused reflection which distributes the light evenly throughout the room.

Never Yellows

Furthermore, this high percentage of light reflection falls off but little as time goes on. Sunflex is made with an absolutely non-yellowing binder. It stays white through exposure to air, light and heat.

Permanence

Sunflex has unusual resistance to heat, moisture, steam, acid fumes and other service factors that rapidly deteriorate most paints. It makes a permanent bond to any solid surface to which it is applied. Laundries, plants housing chemical processes and other buildings where such conditions obtain are using Sunflex in large quantities.

One-coat Coverage

The great hiding power of Sunflex saves a coat of paint on most work. Sunflex will do the ordinary 3-coat job with two coats and the 2-coat job with a single application, hiding wood, concrete, metal and other surfaces with a durable, unifying coat of opaque white. Probably 75% of all Sunflex used goes into one-coat work. The savings in material and labor that follow the elimination of one coat of paint are a worthwhile consideration when cost is a factor.

Pleasant Odor—Quick Drying

Sunflex dries dustfree in an hour with none of the disagreeable odor associated with paint. This feature makes Sunflex

SUNFLEX

ideal for use in plants manufacturing food and other products liable to contamination from paint odors, and hotels, stores, factories and other interiors where rapid repainting with minimum annoyance to occupants is desirable.

Application Over Green Concrete

Sunflex has the unusual characteristic of allowing damp surfaces to "breathe" and moisture to dry through without affecting the bond or appearance of the paint. Concrete can be painted with a permanent coat of Sunflex shortly after the forms are removed. By using Sunflex the architect is able to turn over a finished interior ready for immediate use and occupancy, an important advantage when money is running low. French plaster, green wood and other damp surfaces which will eventually dry out can be similarly painted with Sunflex.

Low Cost

There is practically no step in a painting job where Sunflex does not effect a substantial saving. It can be brushed or sprayed, flows easily, covers very well, is rapidly applied and dries without laps or brush marks. Coat for coat, Sunflex is a cost-cutter—and as already pointed out Sunflex usually eliminates one coat of paint with subsequent further savings in stock and labor.

Containers and Use

Sunflex is a white paste packed in 1, 5 and 10-gallon containers. It is quickly prepared for use by adding water and stirring smooth to painting consistency. It is easily tinted by mixing dry color with the paste or, where desired, we pretint lots of 50 gallons or over to specifications and ship ready for application.

Years of Successful Use

Sunflex was first put on the market in 1926. The best answer to its standing is shown by steadily increasing sales and use in such buildings as the following:

GENERAL INSTRUCTIONS

(1) Be it understood that the Instructions to Bidders and the General Conditions applying on the General Contract, also apply on the painting contract.

(2) **Work to Be Done**—The work required under a painting contract includes the furnishing of all material, labor and equipment of every nature which may be required for the proper painting and finishing of the building, that the work be complete in every respect unless definitely excepted by the architect.

(3) **Work Not Included in the Painting Contract**—A bill of exceptions should be made showing exactly the surfaces which do not come under the painting contract; i. e., the backs of interior wood trim, which will be shop primed by others.

(4) **Preparatory Work**—All surfaces to be painted shall be in proper condition before the work is begun. The surface shall be perfectly dry, clean and smooth. When work is defective or unsuitable for finishing, the painting contractor shall notify the architect in writing. If architect is not notified, painting contractor will be responsible for the finished condition of the work.

(5) **Workmanship**—All work under this contract shall be executed only by concerns of standing approved by the architect. All work shall be made perfect in material, workmanship and finish. All work shall be done by skilled mechanics. Work is not to be done under conditions of weather, or temperature, unsuited to good work.

(6) **Materials**—Material shall be delivered to the building in unbroken packages, bearing the brand and maker's name. Such material shall be used without any adulteration and only with such thinning as called for in the manufacturer's specifications. Sealed packages shall not be broken until the contents are to be used.

Material requiring mixing shall be mixed on the premises and must at all times be subject to the inspection and the approval of the architect.

(7) **Patching**—Carefully patch and finish all work injured or marred from whatsoever cause, to the satisfaction of the architect.

(8) **Cleaning**—When work is completed, all surplus materials, staging, rubbish, etc., shall be removed. All paint, varnish, stains, etc., shall be cleaned from the floors, glass, walls, hardware, etc., and the premises left in perfect condition acceptable to the architect.

(9) **Summary**—Paint, varnish or other finish is not to be applied to any surface containing moisture, bearing scale, rust, dirt, grease, or to any surface not clean and ready to paint.

Alkali in plaster, cement, or concrete surface must be neutralized.

Neutralize the alkali by giving the surface a wash coat with a solution of two pounds of zinc sulphate to a gallon of water.

All nail holes, cracks, etc., must be properly filled with linseed oil putty.

The Famous Three Men Trade Mark

RIPOLIN
THE ORIGINAL HOLLAND ENAMEL PAINT

Ripolin is made in America by European experts and American workmen who have been taught European methods. It is made under the direct supervision of "Ripolin, Limited." The trade-mark is the identification mark for genuine Ripolin Enamel. The secret process of making Ripolin was discovered in Holland thirty-five years ago. Since that time Ripolin has been used throughout the civilized world.

The Famous Ripolin Bending Tin Test

Finishes and Colors

Ripolin Enamel includes gloss, semi-gloss (egg-shell), flat white, and popular tints including ivory, cream, pearl gray, light gray, sea green, light blue, and pink; other tints are obtainable by addition of pure colors ground in japan, or will be manufactured for quantity orders.

Specification No. 1

For All Fine Grained Interior New Woodwork—(Including all fine grained woods, white pine, whitewood, bass wood, etc.)—

Coat No. 1: A priming coat of Ripolin Enamel Undercoating, thinned with 1 qt. of raw linseed oil and ½ pt. of pure turpentine to the gallon.

Coat No. 2: Full coat of Ripolin Enamel Undercoating.

Coat No. 3: Full coat of Ripolin Enamel Undercoating.

Economical

Ripolin has great covering capacity. Because of this fact and its outstanding opacity and also owing to its easy and even flow under the brush, it is economical.

Coat No. 4: Ripolin Enamel Undercoating re-enforced with 1 qt. of Gloss Ripolin added to the gallon to stop suction.

Coat No. 5: A good flowing coat of Ripolin. It is allowable to thin this coat with ½ pt. of pure turpentine to the gallon.

Coat No. 6: A good flowing coat of Ripolin as it comes from the can. Do not thin finishing coat of Ripolin.

Note: If expense is of prime importance, either Coat No. 3 or Coat No. 5 may be omitted. If still further economies are necessary and both Coats No. 3 and No. 5 are omitted increase the amount of Ripolin Enamel added to Coat No. 4.

RIPOLIN (Continued)**Specification No. 2**

For Interior New Woodwork—(Cedar, cypress, hemlock, yellow and Georgia pine, and other heavy-grained, sappy woods; also birch and maple.)—

Coat No. 1: A priming coat of Ripolin Enamel Undercoating thinned with 1½ pt. raw linseed oil and 1½ pt. pure turpentine to the gallon.

Note: After applying *Coat No. 1* all woodwork should be thoroughly rubbed down with fine sandpaper or steel wool. Give the whole surface a light coat of thin white shellac which has been strained through cheesecloth.

Coats Nos. 2, 3, 4, 5 and 6: Proceed as in Specification No. 1.

Specification No. 3

For New or Unpainted Plaster Walls—

Coat No. 1: A sizing coat of Glidden Oil First Coater.

Coat No. 2: A full coat of Ripolin Enamel Undercoating.

Coat No. 3: A coat made by mixing 2 parts Ripolin Enamel Undercoat and 1 part Ripolin Gloss White Enamel.

Coat No. 4: A full flowing coat of Ripolin Enamel of shade selected by architect.

Specification No. 4

For Imitation Tile on Keene's Cement, King's Windsor or Adamant Plaster—

Note: Any of the above plasters are especially good for this purpose. The plaster should be troweled as smoothly as possible, and while wet scored to the depth of ⅛ to ⅜ in. as desired.

Preparation: First wash the walls with weak vinegar or zinc sulphate to neutralize all free alkali present. Thoroughly dry before painting.

Coat No. 1: A coat of Ripolin Enamel Undercoating, thinned with 1 qt. linseed oil and 1 pt. turpentine to the gallon.

Coat No. 2: One coat of Flat Finishing Ripolin to be applied as it comes from the can.

Coat No. 3: One coat of Gloss Ripolin which may be thinned with 1 qt. of turpentine to the gallon.

Coat No. 4: A good flowing coat of Gloss Ripolin as it comes from the can. The joints should be lined up with Flat Ripolin to give a cement effect.

Specification No. 5

For Concrete or Portland Cement—

Note: Owing to the excess of free alkali and occasionally certain chemical conditions created by the process of manufacture of portland cement or concrete under various formulas, difficulty has been experienced in obtaining paints to adhere firmly to these surfaces.

Preparation: The concrete or cement must be thoroughly dry. All new concrete should be washed with a 30% zinc sulphate solution.

Coat No. 1: Liquid Cement Coating which may be thinned with about a quart of turpentine to the gallon.

Coat No. 2: The same approved cement coating.

Coat No. 3: A good full coat of Ripolin of the luster desired as taken from the can.

Notes: On a very rough laid cement an extra coat may be required to thoroughly cover the color of the surface, this being Ripolin Enamel Undercoating applied between coats Nos. 2 and 3.

For much exposed surfaces it is well to add one more coat of Ripolin as it comes from the can. In case two coats of enamel seem necessary it is well to make the first coat Semi-Gloss Ripolin, the finish coat to be of the luster desired.

EXTERIOR FINISHES**Glidden Endurance Paint (Prepared)**

The formulas are not theoretical, but conform with the best modern paint-making practice. Each formula has been put through the most rigorous tests, under adverse conditions, and has shown a permanence and durability which, as far as we know, no other formula for the same use can produce.

Glidden Endurance Paint (Prepared) works easily, covers well, resists wear and weather, has extreme durability, and leaves a good uniform surface for repainting.

Specifications**New Exterior Wood—**

Coat No. 1: As a priming coat, material should be prepared by adding one to two quarts of raw linseed oil to a gallon of Glidden's Endurance Paint (Prepared). On close grained woods, a pint of pure turpentine can also be added. Allow 24 hours for drying.

Coat No. 2: Glidden's Endurance Paint (Prepared) thinned with ½ pint to a pint of pure turpentine. Allow 72 hours for drying.

Coat No. 3: Glidden Endurance Paint (Prepared) as it comes in the container.

Repainting Old Exterior Wood—

Coat No. 1: Glidden's Endurance Paint (Prepared) thinned with one pint of raw linseed oil and one pint pure turpentine to the gallon. Allow 72 hours to dry.

Coat No. 2: Glidden's Endurance Paint (Prepared) as it comes in the container.

Titan-O-Zinc House Paint (White)

Titan-O-Zinc House Paint is a combination of Titan-O-Lith, and high quality zinc oxide, ground in specially treated linseed oil with just the right amount of dryer. It is the finest quality exterior house paint made today.

It covers and hides better than high quality paint, one coat is equal to two coats of ordinary material.

Titanium oxide chemically combined with Sun-proof lithopone gives Titan-O-Zinc House Paint its tremendous covering and hiding qualities. The fine quality zinc oxide gives it hardness of film, durability, and rich beauty. Specially treated oil adds to its whiteness and long life.

It is the latest development in outside paint formulating and manufacturing. Especially adapted for use in congested, smoky districts where fumes are prevailing.

Made in White only which can be tinted to any shade desired.

Specifications

Coat No. 1: Reduce Titan-O-Zinc House Paint to make a priming coat, with two quarts of linseed oil, except in those cases where the wood is unusually sappy and resinous. In these instances it is advisable to add as much as a pint of turpentine cutting the quantity of linseed oil similarly.

Coat No. 2: If but two coats are to be given the work, apply Titan-O-Zinc House Paint as it is furnished in the container. If it is to be a three-coat job, add a pint of turpentine to each gallon of Titan-O-Zinc House Paint for the second coat.

Coat No. 3: To be Titan-O-Zinc House Paint as it comes from the container.

Structural Coatings

Glidden Liquid Red Lead and Nev-A-Rust Structural Coatings are for use on all steel and metal structures. If applied as hereafter specified they will give the best results by inhibiting corrosion and protecting the vital parts of any structure from the destructive elements.

Specifications

Shop Coat: A coat of Glidden's Liquid Red Lead as it comes in the container. To be applied at the mill.

EXTERIOR FINISHES (Continued)

Field Coat No. 1: First patch with Glidden's Red Lead any parts that have been bared by scraping. After drying apply a coat of Glidden Nev-A-Rust as it comes in the container. To be applied by brush.

Field Coat No. 2: A coat of Glidden Nev-A-Rust of color selected by architect as it comes in the container. To be applied with brush.

Note: Before applying material, an absolutely clean steel must be obtained by either sandblasting or wire brushing.

Liquid Cement Coating

A product for dampproofing and uniforming the color of interior and exterior surfaces of concrete, cement, stucco, unglazed tile, brick, or stone. It is decorative, durable, and waterproof.

Specifications

Coat No. 1: Add to each gallon of Liquid Cement Coating shade selected, one pint of Stucolor Mixing Liquid. Apply liberally and brush well into the surface. Allow at least 24, preferably 48, hours to dry.

Coat No. 2: Liquid Cement Coating as it comes in the container, brushing out well and evenly.

Coat No. 3: If necessary; follow specifications for Coat No. 2.

Endurance Shingle Stains

A high grade creosote oil stain to be used on shingles. Prevents warping, curling, splitting and general decay of the wood and supplies the color required.

Specifications

Coat No. 1: Shingles shall be given one dip coat of Endurance Shingle Stain for two-thirds of their length, in the consistency supplied by the manufacturer, and of the color as selected by the architect. Pile shingles loosely to insure proper penetration while drying.

Coat No. 2: After being applied to the roof shingles should be given one full brushing of Endurance Shingle Stain as it comes in the container.

INTERIOR FINISHES**Glidden's Flat Wall Finish**

A durable and decorative finish for walls or ceiling. It is sanitary, washable, and can be used on rough or smooth plaster, wall board, metal ceilings, walls, etc. It is manufactured in a wide range of colors and any tint desired can be easily obtained.

Specifications

Coat No. 1: Either apply Glidden's Oil First Coater, or—Apply Glidden's Flat Wall Primer and Glidden's Flat Wall Finish, mixed in equal parts.

Coat No. 2: Glidden's Flat Wall Finish as it comes in the container allowing plenty of time to dry before Coat No. 3 is applied.

Coat No. 3: Same as Coat No. 2.

Ripol Stipple

This product is designed because it is known that the materials of the character used give a more permanent coating than can be secured with lead, oil and turpentine. Its composition allows much more time for application, so that larger surfaces can be stippled by the same painters, or a man inexperienced in stippling can secure excellent results. The finished surface has a mellow, flat texture suggestive of tapestry paper.

INTERIOR FINISHES (Continued)**Specifications****New or Unpainted Plaster or Cement—**

Coat No. 1: A coat of Glidden's Ripol Seal to stop suction and seal cracks.

Coat No. 2: Glidden's Ripol Stipple Undercoat. Allow 24 to 48 hours to dry.

Coat No. 3: Glidden's Ripol Stipple as it comes from the can—then stipple. If a fine stipple is desired a small amount of turpentine may be added as needed. If an egg-shell gloss is desired, about a pint of raw or refined linseed oil should be added to the gallon of Ripol Stipple to the final coat.

Painted Surfaces—

When surface is clean and ready to paint, apply Coat No. 2 and Coat No. 3 as for new work.

Titan-O-Zinc Flat White

Titan-O-Zinc Flat White is the new Titanium oxide flat for interior use. It is made from Titan-O-Lith (Titanium oxide and lithopone chemically combined under our own patent Nos. 1600772-3) and zinc oxide.

Titan-O-Zinc Flat White covers better than ordinary flat paint. Because of its extreme opacity it will give a solid hiding in one coat over all surfaces in fair condition. This extreme opacity gives a film which will remain white for a greater length of time than other material and gives a foundation for enamels with fewer coats than the average enamel undercoat. It carries a higher percentage of oil and gum than other high quality flat wall finishes and will, therefore, withstand washings to a much greater extent.

It is made in White only which can be tinted to any shade desired.

Specifications

Coat No. 1: Apply one coat of either Glidden's Oil First Coater or a mixture of one-half Glidden's Flat Wall Primer and one-half Titan-O-Zinc Flat.

Finishing Coats: One coat of Titan-O-Zinc Flat over the primer will produce satisfactory results. Where two coats are desired, use Titan-O-Zinc Flat just as it is found in the container for both coats.

Titan-O-Zinc Master Painter's Rapid Drying Enamel

Titan-O-Zinc Master Painter's Rapid Drying Enamel contains the same covering and hiding properties of Titanium oxide and lithopone together with the quick drying advantages of 4-hour enamel. It is the ideal enamel for master painter's use.

Easy brushing properties, greater covering and hiding properties, beauty of film and extreme durability together with quick drying are the unusual advantages found in Titan-O-Zinc Master Painter's Rapid Drying Enamel.

It is made in White only, which can be tinted to any shade desired.

Specifications

Coat No. 1: The preparation and application of this coat should vary depending upon the type of surface to be finished. Refer to Ripolin Specification 1, 2, 3, 4 or 5.

Coat No. 2: One full coat of Titan-O-Zinc Flat.

Coat No. 3: A good flowing coat of a mixture made up of three parts Titan-O-Zinc Flat and one part of Titan-O-Zinc Enamel.

Coat No. 4: Titan-O-Zinc Enamel as it comes from the container.

INTERIOR FINISHES (Continued)**Concrete Floor Dressing**

A decorative and serviceable coating for concrete or cement floors.

Its use unifies the color and beautifies the floor and has a sanitary value by preventing abrasion and dusting of the cement or concrete.

Note: All floors must be thoroughly seasoned. A wash with zinc sulphate is also advisable.

Specifications

Coat No. 1: Glidden's Concrete Floor Dressing reduced with one pint of turpentine to the gallon. After thorough mixing should be brushed well into the surface. Allow 36 to 48 hours to dry.

Coat No. 2 or Patch Coat: Spots showing unusual porosity will dry more flat than the balance of the floor and should be given a coat of Glidden's Concrete Floor Dressing as it comes in the container. Allow it to thoroughly harden and dry.

Coat No. 3: Glidden's Concrete Floor Dressing as it comes in the container. Should be applied and brushed evenly over the surface avoiding all laps.

Note: If additional coat is necessary due to the unusual porosity of the floor apply another coat following specifications for Coat No. 3.

Endurance Wood Stains

A color preparation for varnish finish. Contains a complete range of penetrating stains which greatly enhance the natural beauty of all woods. The colors are of the best quality and the stain does not raise, or cloud, the natural grain of the wood.

Specifications

Coat No. 1: A full coat of Endurance Wood Stain of the color selected.

Mahogany stains require a thin coat of pure shellac before filling. Fill all open grained woods with paste wood filler, removing excess by wiping across grain of woods with bur-lap.

Seal the filled surface with a thin coat of pure shellac. Finish as per varnish specifications.

VARNISHING**Glidden's Japspar (Exterior Varnishing)**

The most durable varnish for exterior use that we can make. It is absolutely waterproof and extremely elastic. Has excellent body and flowing properties. Can be used for interior trim. Can be rubbed to a dull finish in 4 or 5 days.

Specifications**For Close Grained Woods—**

Coat No. 1: If surface is to be stained, use Glidden's Endurance Wood Stain of the shade selected. Allow to dry thoroughly. (See specification on Endurance Wood Stains.)

Coat No. 2: Glidden's Japspar reduced with one pint of pure spirits of turpentine. Allow 36 to 48 hours for drying.

Coat No. 3: Sand second coat lightly with No. 00 sandpaper and apply a full flowing coat of Glidden's Japspar as it comes in the container. Allow 48 hours for drying. If fourth coat is necessary, follow specifications for Coat No. 2. If a rubbed finish is desired, use pumice stone and oil at the end of 5 days.

For Open Grained Woods—

Coat No. 1: Glidden's Endurance Wood Stain of the color selected by the architect.

VARNISHING (Continued)

Coat No. 2: When dry apply a coat of Glidden's Endurance Paste Wood Filler, thinned with naphtha to the consistency of cream. Remove all excess filler by rubbing the surface across the grain.

Finishing Coats: The succeeding coats are to be of Glidden Japspar. Follow specifications for Close Grained Woods.

Glidden's Floorette (Interior Varnishing)

A high grade varnish designed for the finishing of floors. Will not turn white from water, will not scratch or mar white, and its depth of gloss and paleness imparts an unusually beautiful finish to any floor.

Specifications

Coat No. 1: Glidden's Floorette thinned with one pint of pure spirits of turpentine to the gallon. Allow 24 hours to dry.

Coat No. 2: Glidden's Floorette thinned with ½ pint of pure spirits of turpentine to the gallon. Allow 24 hours to dry.

Coat No. 3: Glidden's Floorette applied full body as it comes in the container.

Glidden's Velvet Floor Varnish

A high grade, low lustre, or rubbed effect varnish designed for the finishing of floors. Will not scratch or mar white.

Specifications

Coat No. 1: Glidden's Floorette thinned with one pint of pure spirits of turpentine to the gallon. Allow 24 hours to dry.

Coat No. 2: Glidden's Floorette thinned with ½ pint of pure spirits of turpentine to the gallon. Allow 24 hours to dry.

Coat No. 3: Glidden's Velvet Floor Varnish applied full body as it comes in the container.

Glidden's Wearette

A high grade varnish for general interior use. Light in color, extremely elastic and durable. For finest interior trim in either gloss or rubbed effect. Will stand the most severe wear and rubs and polishes easily.

Specifications

Coat No. 1: Following staining, filling and sealing as covered by specifications under "Endurance Wood Stains," apply Glidden's Wearette thinned with one pint of pure spirits of turpentine to the gallon. Allow 24 hours to dry.

Coat No. 2: Glidden's Wearette applied full body as it comes in the container.

Note: Two coats are ordinarily sufficient. For rubbing, the second coat should be thinned with ½ pint of pure spirits of turpentine to the gallon and the third coat should be used as it comes in the container. Allow 36 to 48 hours for drying before rubbing.

Glidden's Lik-A-Rub

Lik-A-Rub dries with a rubbed or egg-shell effect. Contains no wax and can be varnished over at any time with additional coats of gloss varnish as desired.

Specifications

Coats No. 1 and 2: Follow specifications as given for Wearette.

Coat No. 3: Glidden's Lik-A-Rub as it comes in the container.

Note: For staining and filling, see Glidden's Endurance Wood Stains.

Nature and Uses

Creo-Dipt Dixie White is a special brushcoat preparation that gives the true Colonial flat white effect—the soft velvety appearance of a wash, combined with wear-resisting qualities of Creo-Dipt long-lived stains. It can be used with equally good effect on shingles, brick, stone, cement and wooden siding.

Sold Everywhere by Leading Dealers

Leading paint, hardware, and lumber dealers throughout the United States sell Creo-Dipt Dixie White. Shipments are made from our plants at North Tonawanda, N. Y.; Cleveland, Ohio; Minneapolis, Minn.; Kansas City, Mo.; Seattle, Wash.; and Vancouver, B. C.

Qualities of Dixie White

Dixie White is a true architectural finish—it avoids that "painty" look, yet has the maximum hiding capacity. It remains white and resists the darkening effect of industrial gases. If you prefer Dixie White in tints, you can obtain it in ivory, cream, buff and similar shades.

Samples

Ask the Creo-Dipt representative or write for samples of Creo-Dipt Dixie White and its tints. There is a Creo-Dipt representative near you—look for the name Creo-Dipt in your telephone book. If you cannot find it, write the nearest factory shown on this page.

Application

If Dixie White is to be used on untreated siding,

lumber, brick, stone or stucco, the surface to which it is to be applied should first have a priming coat of white lead mixed with equal parts of raw and boiled linseed oil. Then after this is thoroughly dry, the Dixie White Stain is applied. Creo-Dipt Stained Shingles to be finished with Dixie White are furnished treated with No. 207, a priming coat. They are given two coats of Dixie White after they are applied. Detailed directions for the application of Creo-Dipt Dixie White are printed on the label of each can.

Covering Capacity

One gallon of Dixie White over No. 207 or a priming coat will cover about 150 square feet two brushcoats, or 225 square feet one brushcoat.

Creo-Dipt Stains

Creo-Dipt Brushcoat Stains—for renewing the colors and preserving old shingles—are supplied in a complete line of attractive shades. Many architects are now using Creo-Dipt Stains for siding or clapboards on new homes. For further details, ask the Creo-Dipt representative.

Other Creo-Dipt Products

In addition to Creo-Dipt Dixie White and Brushcoat Stains, we manufacture the widely known Creo-Dipt Stained Shingles, the Handi-Ironing Cabinet, and Creo-Dipt Weatherproofed Building Paper. For further information and pages on other Creo-Dipt products see Manufacturers' Index in this edition or ask nearest Creo-Dipt representative.

Dixie White on Shingle and Brick Home of Dean Mathey, Princeton, N. J.

Designed by ARTHUR C. HOLDEN

The two wings are Creo-Dipt Stained Shingles, brushcoated with Dixie White, after being dipped at the factory in No. 207, preparatory treatment. The brick chimneys and center portions of the house are brushcoated with Dixie White.

DU PONT NAVALITE VARNISH (Exterior)
DU PONT FOUR HOUR VARNISH

REG. U. S. PAT. OFF.

(1) **Specifications**—Filler to be reduced with turpentine or benzine at the rate of 8 to 10 lb. of filler to 1 gal. of reducer. Apply 1 brush coat of Du Pont Wheeler's () Paste Wood Filler. Allow work to stand until the filler has set or become dull, then rub the filler well into the pores of the wood, wiping off

the surplus with a cloth or sea moss, rubbing across the grain. Allow to dry at least 24 hours before finishing coats are applied.

Du Pont Architectural Varnishes

These varnishes, formerly sold under the Chicago "Yellow Can" label, have been specified by architects for the past 50 years, and are accorded first place in the varnish field.

Shipoleum Interior Finish—The very highest grade of interior varnish. Should be specified for use on fine residences, churches, schools, hospitals, asylums, public buildings, bathrooms. It stands heat and moisture, is very elastic and never cracks. May be rubbed and polished.

Supremis Floor Finish—The first varnish put on the market especially for floors, and one that has always retained its leadership. It is a remarkable wood preservative, dries hard and elastic, is extremely pale in color, is thoroughly waterproof and will not mar or scratch white.

When rubbed, it produces the soft eggshell luster of French polish.

Chi-Vo—Noted for its beautiful rubbed appearance without the labor and expense of rubbing. This is a distinctive varnish, made by a new process, and has a third more spreading capacity than ordinary varnishes.

Should be specified as a finishing coat over Shipoleum Varnish.

Navalite (Spar)—Especially adapted for use on front doors, vestibules and any exterior surface subject to all kinds of weather conditions. It will retain its luster and elasticity under severe conditions and meets every requirement of drying, appearance and durability.

Four Hour Varnish—The full gloss varnish which dries with convenient rapidity. It is designed for use on floors and all interiors. Du Pont Four Hour Varnish is elastic and will not mar white. The use of this product enables the painter to complete a two-coat job in a single day.

(2) **Specifications**—Apply 3 coats of Du Pont Architectural () Varnish. Each coat to be sanded (except Chi-Vo) when thoroughly dry, with No. 00

The Du Pont Line

The quality reputation enjoyed by the Du Pont line of Finishes has been built on two primary factors: the establishment of rigid standards of quality, and the setting up of machinery and methods to insure strict adherence to these standards. These two principles have established in the public mind a confidence in Du Pont products, and the strict adherence to these standards assures the architect of the best possible results.

To its unique technical and scientific experience, the Du Pont Company combines a practical paint manufacturing experience which dates back over a century—with the old Harrison paint line, the Yellow Can Varnishes of the Chicago Varnish Works, and the stains, fillers and finishes formerly manufactured by the Bridgeport Wood Finishing Company as antecedents of the present Du Pont line.

Du Pont Wheeler's Paste Wood Filler

The original silex wood filler, used by the leading piano and furniture manufacturers for over 40 years. It is specified by leading architects for all types of building construction, including the finest public and residential work. Forms a permanent, unshrinkable, transparent foundation in the pores of the wood for the support of the finishing coats.

Supplied in Transparent, Walnut or Light Antique, Golden Oak, Mahogany, Mahogany N (for dark mahogany effects), Ebony and Special White.

sandpaper, and dusted. Final coat to be rubbed to flat, eggshell or polish, as desired. If time or expense will not permit rubbing, the use of Chi-Vo is recommended.

Du Pont Penetrating Stain

For producing on practically all woods, with the possible exceptions of mahogany and walnut, clear toned stained effects.

These stains do not raise the grain of the wood or show laps. They penetrate the wood deeply, bringing out the full beauty of the grain.

Where economy of finish is a factor, the oak shades may be used as a 1-coat finish, but are generally finished over with stain sealer and wax; stain sealer and varnish; filler, stain sealer and wax; or filler and varnish. On close grained woods, the use of filler is not necessary.

The mahogany shades are generally used on such close grained woods as birch, gumwood, pine, fir, cypress and whitewood, and should be finished over with stain sealer and varnish coats.

Regularly supplied in the following colors:

Light Oak, Brown Oak, Golden Oak, English Oak, Flemish Oak, Walnut, Light Mahogany, Dark Mahogany, Brown Mahogany, Mission Green, and Circassian Walnut (for gumwood only).

(3) **Specifications**—Apply brush coat of Du Pont () Penetrating Stain. Allow work to stand for 4 or 5 minutes and wipe off surplus stain with a cloth to secure uniform effect. Allow to dry 24 hours before applying further finishing coats.

Du Pont Stain Sealer

A sealing coat for Penetrating Stains which also perfectly supports the varnish coats.

This product is much superior to shellac for the purpose, as it prevents the stain from "bleeding" through the varnish coats. Do not specify the use of Penetrating Stains without the use of Stain Sealer.

(4) **Specifications**—Apply 1 brush coat of Stain Sealer over Penetrating Stain; allow to dry 24 hours and sand or hair lightly. Dust work before applying varnish coats.

Du Pont Acid Stain

Intended for use on all types of wood in producing the delicate light gray and brown satiny effects not possible with any other type of stain.

The mahogany effects are generally used on genuine mahogany wood in connection with Wheeler's Paste Wood Filler, such effects being finished over with varnish coats. Use filler on all open grain woods. Grays and fumes are generally finished over with Wonderlac.

Regularly supplied in the following colors:

No. 1000 Dark Fumed Oak, No. 1314 Light Fumed Oak, Standard Gray, Satin Gray, Steel Gray, Smoked Pearl, Mahogany, Dark Mahogany, Brown Mahogany. Write for panels showing new gray and brown tones.

(5) **Specifications**—Apply 1 brush coat of Du Pont () Acid Stain. Allow work to dry thoroughly, about 12 to 24 hours, and sand surface smooth with No. 00 sandpaper. Dust work before applying further finishing coats.

Wonderlac

A dull lusterless finish adapted for use *only* over the Gray and Fumed Acid Stains. Does not change the

color of the most delicate shades and forms a damp-proof finish.

(6) **Specifications**—Apply 2 brush coats of Wonderlac over Standard Gray (or Fumed Oak) Acid Stain, allowing 8 hours between coats for drying.

Du Pont Prepared Wax

Used in producing the waxed effect on interior woodwork and floors.

(7) **Specifications**—Apply 2 coats of Prepared Wax. Apply with a cloth evenly over the entire surface; allow to stand 10 to 20 minutes and polish with a soft cloth. The second coat may be applied in the same manner 24 hours after the first coat has been polished.

Du Pont Enamel Undercoat (White)

This is the proper undercoat for an enamel finish. Possesses excellent spreading qualities presenting full body on the work. Forms a hard, smooth finish, causing the enamel to stand out with full gloss and luster.

(8) **Specifications**—Apply 2 brush coats of Du Pont Enamel Undercoat as follows:

First Coat—Thin with linseed oil at rate of 1 qt. of pure raw linseed oil to 1 gal. of Undercoat. For pine or cypress, substitute turpentine for linseed oil. Allow to dry 48 hours and sand with No. 00 sandpaper.

Second Coat—Apply Undercoat as it comes from the can. Allow to dry 48 hours and sand with No. 00 sandpaper.

FlowKote Enamel

A high grade strictly long oil, zinc pigment enamel that will not change color. Adapted for both interior and exterior work.

Supplied in White and Ivory, in both gloss and rubbed finish. The latter type gives the hand rubbed effect without the labor and expense of rubbing; and if rubbed finish is specified, no rubbing is necessary for the final coat.

(9) **Specifications**—In addition to the Enamel Undercoat mentioned above, specify 1 coat of equal parts, Undercoat and FlowKote Enamel, followed by 1 coat of Du Pont FlowKote Enamel. Sand first coat when thoroughly dry with No. 00 sandpaper. Dust work and apply second coat. Final coat to be (left in gloss or rubbed eggshell) as desired.

Du Pont Special Lab Enamel

Special Lab Enamel (or Fumeproof Enamel) is an intensely white product composed of specially prepared varnish and selected pigments, being designed to withstand extraordinary conditions, such as fumes, gaseous vapors, etc., which readily discolor usual enamel.

It dries with a hard, durable elastic film of either eggshell or high gloss effect and may be repeatedly washed. Although primarily prepared for use in hospitals, laboratories, bakeries, factories, etc., it is an exceptional general utility product.

Du Pont Lab Enamel is furnished in white only, gloss or eggshell, but may be easily tinted to any shade desired with Du Pont Oil Colors.

(10) **Specifications (New Work)**—*Preparation*—All surfaces must be perfectly dry and all loose or scaling particles removed by wire brushing. Grease or oil spots shall be removed by washing thoroughly with benzine or gasoline.

Specification No. 1, for New or Unpainted Plaster, Concrete, Wall Board or Brick—

Note: If the surface to which the coating is to be applied is green or particularly strong in alkali, use the following clause: "Apply a neutralizing coat of zinc sulphate crystals, using 3 to 4 lb. dissolved in a gallon of water. After applying solution, allow to dry and then brush off any loose crystals which may remain."

First Coat—Du Pont Enamel Undercoat to which has been added Du Pont Primer Sealer in equal proportions.

Second Coat—Du Pont Enamel Undercoat to each gallon of which has been added ½ gal. of Du Pont Special Lab Enamel.

Third Coat—Du Pont Special Lab Enamel—egg shell or full gloss.

Specification No. 2, for Woodwork—First Coat—Du Pont Enamel Undercoat thinned with pure spirits of turpentine to priming consistency.

Second Coat—Du Pont Enamel Undercoat to each gallon of which has been added ½ gal. of Du Pont Lab Enamel.

Third Coat—Du Pont Lab Enamel.

Specification No. 3, for Metal Walls and Ceilings—First Coat—Kromate Metal Primer.

Second Coat—Du Pont Enamel Undercoat without thinning.

Third Coat—Du Pont Enamel Undercoat to each gallon of which has been added ½ gal. of Du Pont Lab Enamel.

Fourth Coat—Du Pont Lab Enamel.

(11) Specifications (Old Work)—Preparation—Plaster, brick, or concrete surface shall be carefully wire brushed to remove scaling or loose particles. Holes or cracks shall be filled smooth with plaster of paris and such places treated with Primer Sealer and Enamel Undercoat, same as for new work as given in Specification No. 1.

Specification No. 4—First Coat—Du Pont Enamel Undercoat.

Second Coat—Du Pont Special Lab Enamel.

Note: Where the old film is not badly discolored, omit the first coat of Enamel Undercoat.

Du Pont Prepared Paint

An exceptionally durable house paint made to withstand extreme weather conditions. Has exceptional durability and covers well.

Color card on request, showing 30 attractive colors.

(12) Specifications—Preparation—Coat all knots and sappy streaks with shellac, to prevent showing through subsequent paint coats. Apply 3 coats Du Pont Prepared Paint () as follows:

On very resinous knots the resinous matter should be "pulled out" of the surface by the use of the blow torch, followed by a brush coat of turpentine or benzole just before application of the priming coat. Apply 3 coats of Du Pont Prepared Paint () as follows:

Priming Coat—Thin to priming consistency with equal parts linseed oil and turpentine. (For soft, open grained woods like white pine and poplar, thin with 3 parts oil and 1 part turpentine. On resinous woods, such as yellow pine, reduce with 1 part oil and 3 parts turpentine.) All nail holes to be puttied after first coat.

Second Coat—Thin to working consistency with a mixture consisting of 1 part raw linseed oil and 2 parts turpentine. Brush out well.

Third Coat—Apply without thinning, except when conditions warrant the use of a little turpentine.

Du Pont Flat Wall Paint

A ready-to-use interior wall finish, producing a soft, matte surface that can be repeatedly washed. Covers exceedingly well and does not show brush marks.

Supplied in 10 colors and white. Send for color card, showing these colors in various combinations.

(13) Specifications—First

Coat—Du Pont Flat Wall Paint, to each gallon of which has been added from a quart to a half gallon of Du Pont Primer Sealer depending on porosity of surface.

Second Coat—Du Pont Flat Wall Paint of package consistency.

Third Coat—Same as second coat.

Du-Lite (Mill White) Enamel

Du-Lite is a mill white of lasting whiteness. In its manufacture the oils are treated by a unique and exclusive process called "thermostatic control." Du-Lite stubbornly resists discoloration—remains white over a long period of service.

Du-Lite is a white enamel made in the following finishes: Du-Lite Undercoater, Du-Lite Gloss, Du-Lite Eggshell and Du-Lite Flat.

Three coats recommended for all new or unpainted work.

(14) Specifications for Use Over Cement, Concrete, Brick and Plaster—Preparation—All surfaces must be thoroughly dry and free from grease and dirt.

(Caution: New or green surfaces, particularly green or strong in alkalis, should first be washed with a solution made by dissolving 3 to 4 lb. of zinc sulphate in 1 gal. of water.)

Finishing—First Coat—Du Pont Du-Lite Undercoater to each gallon, of which has been added an equal amount of Du Pont Primer Sealer.

Second Coat—Du Pont Du-Lite Undercoater to each gallon of which has been added ½ gal. of Du-Lite Enamel.

Third Coat—Du Pont Du-Lite Gloss, Eggshell or Flat.

Where only 2 coats are used, the following specification is recommended:

First Coat—Du Pont Du-Lite Undercoater.

Note: Where brick and concrete surfaces are very porous, 1 qt. of Du Pont Elastic Wall Primer should be added to each gallon of Du-Lite Undercoater for first coat.

Second Coat—Du Pont Du-Lite Gloss, Eggshell or Flat.

(15) Specifications for Use Over Wood and Wall Board—Preparation—All surfaces must be thoroughly dry and free from grease and dirt. Knots and sappy places in wood shall be shellacked before painting and all nailholes puttied after first coat.

Finishing—First Coat—Du Pont Du-Lite Undercoater reduced to priming consistency with equal parts of pure raw linseed oil and spirits of turpentine or turpentine substitute.

Second Coat—Du Pont Du-Lite Undercoater.

Third Coat—Du Pont Du-Lite Gloss, Eggshell or Flat.

Where only 2 coats are used, the second coat may be omitted.

(16) Specifications for Use Over Structural Iron

or Steel and All Metal Work (except Galvanized Iron)—Preparation—Metal surfaces shall be cleaned of all scale, dirt, rust and grease.

Finishing—First Coat—Du Pont Kromate Metal Primer.

Second Coat—Du Pont Du-Lite Undercoater.

Third Coat—Du Pont Du-Lite Gloss, Eggshell or Flat.

Where only 2 coats are used, the first coat may be omitted.

Note: When galvanized iron is used, apply a solution of copper sulphate, using 8 oz. in 1 gal. of warm water. When dry, priming coat, as above, may be applied.

Du Pont Primer Sealer

The proper foundation for Du Pont Flat Wall Paint and Du-Lite. Stops the suction in plaster walls and prevents plaster burns from showing through subsequent coatings.

(17) Specifications—See Du Pont Flat Wall Paint and Du-Lite Specifications.

Du Pont Old English Paint Oil

Old English Paint Oil is a specially prepared vehicle for general painting purposes. The oil is made on a China wood oil base, which is well known as one of the most complete oxidizing oils in existence. It has practically the same body as linseed oil, although much lighter in color, making it particularly well adapted for use with light colored paints. When Du Pont Old English Paint Oil is used no driers are required.

Furthermore, Old English Paint Oil does not "burn up" the life of the linseed oil generally incorporated in paints as driers are inclined to do. This product when used as a reducer of gloss or flat paints adds to their durability, makes them more washable and more easily applied.

It is unsurpassed as a wall size, being steamproof and waterproof. Old English Paint Oil is an exceptional floor dressing. It will not darken the wood nor bruise white, but dries with a hard, tough, elastic surface. Two coats give a good gloss finish. By the addition of turpentine Old English Paint Oil will give a beautiful satin gloss effect, or even a flat, dependent upon the quantity of turpentine used.

A few other general uses of this product are:

When added to shingle stain it binds the colors free from wash.

For tempering varnishes and glossing paints.

As a blender for raw oils.

For dressing oil cloth and linoleum.

For application to exterior brick or cement surfaces as a waterproofing material.

Makes green and black paints dry quickly and hard.

Resists mildew.

Antoxide (Rust Inhibitive)

A rust inhibitive paint with a varnishlike vehicle, that completely covers the surface and prevents moisture from attacking the metal and causing rust. It prevents the formation of rust beneath the coating as well as progressive oxidation where it has already begun.

This paint withstands acid fumes to a most unusual degree, therefore is peculiarly adapted for use around smelters, acid plants, paper and other mills. It is also used on water towers, inside and out, as it does not foul water.

(18) Specifications—Preparation—Surface to be free from grease, dirt and dust. Wire brush to remove scale.

First Coat—Du Pont Kromate Metal Primer.

Second Coat—Du Pont Antoxide (), to each gallon of which has been added 1 pt. of turpentine.

Third Coat—Du Pont Antoxide (), as contained in package.

Du Pont Kromate Metal Primer

One of the latest developments in metal primers for structural steel or sheet metal, the principal pigment being basic lead chromate. Supplied in ready mixed form and is far superior to red lead in rust inhibitive properties.

(19) Specifications—See Du Pont Flat Wall Paint and Antoxide specifications.

Du Pont Floor and Deck Enamel

A hard drying, wear resisting, high gloss enamel paint for the preservation of exterior and interior wood and concrete floors. Supplied in 11 colors.

(20) Specifications (Wood Floors)—First Coat—Du Pont Floor and Deck Enamel Paint () to each gallon of which has been added 1 pt. pure turpentine.

Second Coat—Du Pont Floor and Deck Enamel Paint () as received in original package.

(21) Specifications (Concrete Floors)—First Coat—Du Pont Floor and Deck Enamel Paint () to each gallon of which has been added from 1/2 to 1 pt. pure turpentine.

Second Coat—Du Pont Floor and Deck Enamel Paint () as received in original package.

(Caution: Concrete floors should age for at least 30 days before painting. Refer Du-Lite Specification 12 for new concrete wall and ceiling surfaces.)

Du Pont Duco (Spray Application)

Information supplied on request.

Special Note

Realizing that the architects of today are constantly striving for uniqueness, economy and beauty, but not at the expense of quality or serviceability, the Du Pont Company, research leaders in the chemical field, is vitally interested in encouraging, assisting and promoting the architects' handiwork.

The Architectural Division of the Du Pont Company is maintained for the express purpose of co-operating with the architectural profession. Every attempt is made to study the problems pertaining to the profession, and the use of the service of one of the Du Pont architectural representatives or direct contact with any of the offices is cordially welcomed.

Supplementing the personal assistance available at all times, the opportunity of furnishing you with the specially prepared *Architectural Specification* manual would be appreciated. This manual is attractively bound in standard architectural file size, conveniently arranged so as to give ready reference to specifications covering the Du Pont line.

In addition to this, a selected list of finished panels, the result of exhaustive research with the architects, is kept on hand at all times awaiting your requests. Every panel carries a complete outline of the finishing procedure.

Eagle White Lead—For All Types of Painting

Pure lead paint (made from white lead carbonate ground in linseed oil) continues to be the most satisfactory answer to all general painting problems. In the hands of a good painter, it is quickly mixed to suit *exactly* all the requirements of each job. It readily fits into any color scheme or decorative plan, for the painter tints it to the desired shade on the job. There is no guesswork.

Pure lead paint expands and contracts with changes in temperature; the film is elastic and long wearing despite severe weather conditions. It wears away slowly, so that when repainting is necessary, the old film forms a perfect base for the new white lead coats. No burning or scraping off is required when pure lead paint is used.

Eagle White Lead comes in two forms: heavy paste and easily-mixed *soft paste*. Both are pure lead carbonate ground in linseed oil, but *soft paste* contains more oil per 100 lbs. This additional oil, ground in at Eagle factories, saves the painter time in preparing the mixture for the brush. Both heavy and *soft paste* Eagle White Lead are available in 100, 50, 25 and 12½-lb. air tight steel kegs.

For Interior Decoration—(a) Flat Effects and "Egg-Shell" Gloss Finishes—When pure white lead is thinned to brushing consistency with Eagle Flatting Oil, the resulting paint provides a durable finish which may be tinted to any color required by the decorative plan. The paint dries into a smooth washable surface showing no brush marks.

Before application, the wall surface should be thoroughly dry; if, for example, paint is applied on plaster walls which are still damp, cracking will develop. No amount of quality materials and skillful workmanship can avert it. Loose paint scales, if present, must be scraped and sandpapered off; oil or grease spots must be removed, for paint will not adhere to these surfaces. All dust must be wiped off; otherwise it is liable to mix with the paint and discolor it.

General Formulae (heavy paste only is considered):

New Inside Work Priming Coat

Eagle White Lead.....	100	lbs.
Pure Raw Linseed Oil.....	3	gals.
Pure Turpentine	1	gal.
Best Japan Drier.....	1½	pts.
Paint produced	7	gals.

Second Coat

Eagle White Lead.....	100	lbs.
Pure Raw Linseed Oil.....	1½	gals.
Pure Turpentine or Eagle Flatting Oil.....	1½	gals.
Best Japan Drier.....	1	pt.
Paint produced	5½	gals.

Third Coat—Oil Gloss

Eagle White Lead.....	100	lbs.
Pure Raw Linseed Oil.....	3-3½	gals.
Pure Turpentine or Eagle Flatting Oil.....	1	pt.
Best Japan Drier.....	1	pt.
Paint produced	6-6½	gals.

Third Coat—Flat

Eagle White Lead.....	100	lbs.
Turpentine or Eagle Flatting Oil.....	3	-3½ gals.
Paint produced	5¾-6¼	gals.

Old Inside Work First Coat

Eagle White Lead.....	100	lbs.
Pure Raw Linseed Oil.....	1	gal.
Pure Turpentine or Eagle Flatting Oil.....	2-3	gals.
Best Japan Drier.....	1	pt.
Paint produced	5¾-6¼	gals.

TRADE-MARK

Second Coat—Oil Gloss

Eagle White Lead.....	100	lbs.
Pure Raw Linseed Oil.....	3-3½	gals.
Pure Turpentine or Eagle Flatting Oil.....	1	pt.
Best Japan Drier.....	1	pt.
Paint produced	6-6½	gals.

Second Coat—Flat

Eagle White Lead.....	100	lbs.
Turpentine or Eagle Flatting Oil.....	3	-3½ gals.
Paint produced	5¾-6¼	gals.

Note: Eagle Flatting Oil, as recommended in the foregoing specifications, is obtainable in quart, gallon, and 5-gallon packages. A companion product to Eagle White Lead, Eagle Flatting Oil is indispensable in effecting the rich, tasteful wall finishes made from pure white lead paint.

In the foregoing formulae, no consideration has been made for color other than that of the natural gleaming whiteness of pure lead paint. Any oil colors of known quality effectively combine with Eagle White Lead; a tinting chart will be sent on request.

(b) Plastic Finishes from White Lead Paint—Dignified, low-relief textures can be secured with Eagle White Lead. Tones and shades are limitless, depending on the motif of the individual decorative scheme. Any skilled craftsman can quickly execute these tasteful plastic finishes; a detailed booklet on this subject will be sent without charge to any architect desiring it. General Formula:

Eagle White Lead (heavy paste).....	100	lbs.
Whiting	15	lbs.
Dental Plaster of Paris.....	10	lbs.
Eagle Flatting Oil (1½ gals.).....	11	lbs.
Makes about 5½ gals. of Plastic Paint.		

For Exterior Decoration—Pure lead paint has long enjoyed unequalled prestige for durability and beauty in outside painting work. The surface, prior to painting, must be prepared in general as suggested under "Interior Decoration." General Formulae (*soft paste* only is considered):

Old Outside Work

First Coat

Eagle Soft Paste White Lead.....	100	lbs.
Raw Linseed Oil.....	3	qts.
Turpentine	1¾	gals.
Best Japan Drier.....	1	pt.

Makes about 6 gals. of white paint.

Second Coat

Eagle Soft Paste White Lead.....	100	lbs.
Raw Linseed Oil.....	2½	gals.
Turpentine	1	pt.
Best Japan Drier.....	1	pt.

Makes about 6¼ gals. of white paint.

New Outside Work

Priming Coat

Eagle Soft Paste White Lead.....	100	lbs.
Raw Linseed Oil.....	2¾	gals.
Turpentine	1½	gals.
Best Japan Drier.....	1	pt.

Makes about 7½ gals. For very light-colored woods ½ gal. more of oil may be added.

Second Coat

Eagle Soft Paste White Lead.....	100	lbs.
Raw Linseed Oil.....	1	qt.
Turpentine	1½	gals.
Best Japan Drier.....	1	pt.

Makes about 5½ gals. For very light-colored woods ¼ gal. more of oil may be added.

Third Coat

Eagle Soft Paste White Lead.....	100	lbs.
Raw Linseed Oil.....	2½	gals.
Turpentine	1	pt.
Best Japan Drier.....	1	pt.

Makes about 6¼ gals. For very light-colored woods 1 pt. more of oil may be added.

Eagle Sublimed Blue Lead—for Metal Surfaces

9 reasons for rustproofing with sublimed blue lead:

- (1) Proper basicity, chemically stops corrosion.
- (2) Exceptional durability.
- (3) Elasticity and toughness in oil.
- (4) Extreme fineness and smoothness.
- (5) Easy brushing, spraying and dipping qualities, air dried or baked.
- (6) Remarkable opacity.
- (7) Pleasing color—the color being slate gray.
- (8) Exceptionally low cost per square foot finishing surface.
- (9) Will not harden in the keg.

The superiority of Sublimed Blue Lead in Oil as a rust preventive is no theory. It is a proven fact.

The American Society for Testing Materials tested the rustproofing value of all available rust inhibitive paints (about 50 in number) by actual exposure of 300 steel panels to which these paints had been applied. Most of them failed the first year. Of all the commercial paints tested, after the tests had extended over six years, the highest rating for rustproofing efficiency was awarded to Sublimed Blue Lead in Oil.

Every architect, engineer, builder, and industrial executive should know the facts about Sublimed Blue Lead. A booklet, "Rustproofing with Sublimed Blue Lead," will be sent free of charge upon request.

How Sublimed Blue Lead Inhibits Rust—It is known that corrosion can be retarded by the use of a paint containing a pigment which is "chemically basic." Sublimed Blue Lead is basic and retards the rusting of steel through these two functions of its film: exclusion and inhibition (chemical prevention) of rust formation.

Exclusion is accomplished by having a dense homogeneous film through which moisture, corrosive vapors, and oxygen of the air cannot penetrate. The excluding property of a Sublimed Blue Lead film is increased by these among other factors: proper relation between pigment and oil volumes; chemical bond between oil and pigment; uniformly fine pigment particles; and pigment unchanged by atmospheric contact. The surface is therefore protected from carbon dioxide, sulphur dioxide, sulphurous acid, carbon monoxide, soot, etc.; deterioration is prevented. Sublimed Blue Lead expands and contracts with the metal as changes in temperature occur. It does not sag when applied to perpendicular surfaces.

Some paints are practically neutral as rust inhibitors, and some paints actually "promote rust." The pigment is the deciding agent. The point is—the mere painting of steel will not necessarily prevent corrosion unless a rust inhibitive pigment is used.

Even when in time the vehicle has become permeable to moisture, Sublimed Blue Lead continues to function as a rust inhibitive pigment.

Sublimed Blue Lead is of impalpable fineness. Mixed with linseed oil, volatile thinners, and driers, it produces a paint of exceptional hiding power, together with remarkable brushing, spraying, and spreading qualities. It covers the surface uniformly, and will endure years of exposure without cracking, checking or peeling.

What Sublimed Blue Lead Is—Sublimed Blue Lead is a fine, slate-gray powder, produced by sublimating galena ore (lead sulphide) in special furnaces. The pigment is ground with pure linseed oil, accurately mixed in proper proportions. No other raw materials are employed. Sublimed Blue Lead is not only supremely efficient in rustproofing service, but is economical in original cost. It gives a maximum yield per pound in paint produced, in application, because of its easy spreading qualities; requires a minimum of labor, and its use assures protection of metal surfaces for an unusually long period. A gallon of properly mixed Sublimed Blue Lead will cover 700 to 800 sq. ft. of metal surface of average smoothness.

Sublimed Blue Lead is not a new product. It has been on the market many years, during which it has always demonstrated qualities that make it a leader among the rust-preventative pigments.

Where to Use Sublimed Blue Lead—Sublimed Blue Lead is an ideal pigment for every purpose requiring a metal protective paint. Its first use is as a priming coat (direct to the metal). Sublimed Blue Lead is equally as good for second and finishing coat work for metal or wood.

Sublimed Blue Lead is a pleasing slate-gray color and may be used just as well as White Lead tinted gray. All gray colored paints fade slightly, but no more so with Sublimed Blue Lead than any other gray. Sublimed Blue Lead makes an attractive trim on metal or wooden structures and adds to the appearance of buildings. When used as a priming coat it may be painted over with Eagle White Lead in oil or Eagle Sublimed White Lead, or mixed with either of them or with other combinations such as red lead, American vermilion, commercial chrome green or commercial chrome yellow. It can be brushed, sprayed, dipped, or air dried.

How to Use Sublimed Blue Lead—The removal of rust, mill scale and dirt should be done generally by sand blasting or the use of metal brushes, scrapers, chisels, hammers or other effective means. Bright steel should be exposed in all cases. If sand blasting is used, the first coat of paint must follow immediately.

Oil and grease may be removed by the use of gasoline or benzine. Do not apply paint on wet or damp surfaces and in no case until preceding coat is dry and hard. Allow two to four days before applying second coat for exterior work. For priming coat on interior allow one week before applying a second coat, and twenty-four hours between second and third coats.

Paint shall be evenly spread and shall be thoroughly brushed out. Where solder fluids have been used on metal surfaces, it shall be cleaned thoroughly with benzine before any paint is applied. All rivet heads and bolts, and all edges and corners shall be thoroughly covered with paint in painting structural steel or other metal work.

In exceptional instances pickling is advisable for small work and especially before painting galvanized metal, otherwise treat it with a solution of eight ounces copper sulphate to one gallon of soft water, allow to dry and brush off, follow by using Sublimed Blue Lead. Paint shall be thoroughly stirred before being removed from container and while it is being applied.

How to Secure Sublimed Blue Lead—Sublimed Blue Lead in Oil sells at the same low price as Eagle White Lead in Oil and may be had in the following sizes: 12½, 25, 50 and 100-lb. containers, or may be secured from a reliable paint manufacturer by specifying pure Eagle-Picher Sublimed Blue Lead mixed to paint consistency ready to apply.

In the container, the pigment remains perfectly in suspension; it will not harden or liver. It may be kept in the keg without deterioration.

Paint Formulas**Sublimed Blue Lead in Oil (paste)****First Coat**

Sublimed Blue Lead in Oil.....	100 lbs.
Raw Linseed Oil.....	2½ gals.
Turpentine or paint and varnish manufacturers' 49° naphtha	1½ gals.
Drier (rosin free).....	1 qt.

Second Coat

Sublimed Blue Lead in Oil.....	100 lbs.
Raw Linseed Oil.....	3 gals.
Turpentine	2 qts.
Drier (rosin free).....	1 qt.

Sublimed Blue Lead—Dry (powder)**First Coat**

Sublimed Blue Lead—Dry.....	90 lbs.
Raw Linseed Oil.....	4 gals.
Turpentine or 49° Naphtha.....	1½ gals.
Drier (rosin free).....	1 qt.

Second Coat

Sublimed Blue Lead—Dry.....	90 lbs.
Raw Linseed Oil.....	4½ gals.
Turpentine or 49° Naphtha.....	2 qts.
Drier (rosin free).....	1 qt.

To increase the permanence of the color, many users add about 3% lampblack to formulas for second and finishing coats.

49° naphtha represents the gravity known as the Baumé or hydrometer test for a liquid weight. The initial boiling point of this naphtha is 210° F. and the end point about 332° F.

The Raw Linseed Oil shall conform to the linseed oil specifications of the A.S.T.M. Standards, pages 655-658, Vol. 21.

The Japan Drier shall be pure unadulterated drier containing no rosin.

The Turpentine used shall be pure unadulterated turpentine and conform to the specifications of the Department of Commerce, Bureau of Standards, as given in Circular No. 86.

(Note: For painting metal surfaces that may become too hot to warrant the use of linseed oil, substitute fish oil.)

Eagle Red Lead—Dry and in Oil

While we recommend Sublimed Blue Lead as the most effective yet most economical rustproofing pigment on the market, we are also manufacturers of pure red lead. Eagle Red Lead in Oil is packed in 100, 50, 25, and 12½-lb. kegs. In dry form, it is put up in barrels of 500-600 lbs.

It possesses high "true" red lead content and is fine enough to insure splendid brushing qualities. It is impervious to water and unaffected by atmospheric gases. The rapid drying qualities of Eagle Red Lead make it decidedly advantageous for use where a hard surface, capable of withstanding abrasion, must be produced in a shorter time than usual.

HILO VARNISH CORPORATION

(MOLLER & SCHUMANN CO.)
ESTABLISHED 1863

Manufacturers Varnishes, Enamels, Fillers and Stains

Marcy and Flushing Avenues
BROOKLYN, N. Y.

BRANCH OFFICES

BOSTON, MASS., 102 Merrimac Street
CHICAGO, ILL., 2420 Washburne Avenue

CLEVELAND, OHIO, Builders Exchange Building
PHILADELPHIA, PA., 133 Spring Garden Street

Products

QUALITY FINISHES for all surfaces—wood, metal, plaster, stone, concrete.

VARNISHES—Interior and Exterior; Staining Varnishes.

ENAMELS—Interior and Exterior; Colored Enamels; Floor Enamels.

PENETRATING OIL STAINS.

WOOD FILLERS.

PRIMERS.

TRADE MARK

Hilo Brands

Molmanite—a high grade white enamel for all surfaces, interior and exterior.

White Enamel Undercoat—well suited for all enamel foundation work.

Speed-Up Floor Varnish—a quick drying lustrous varnish. Durable and waterproof.

Speed-Up Floor Enamel—an exceptionally durable liquid coating for wood or concrete. Made in eight colors or special colors on order.

Speed-Up Spar Varnish—a tough, durable varnish for outside woodwork.

Speed-Up Interior Varnish—an unusually high class varnish for interior woodwork, trim, doors, etc.

Cabinet Finish—a rubbing and polishing varnish for woodwork and cabinet trim. Dries with a fullness which allows close rubbing.

Flat Finish Varnish—gives a rich rubbed effect without the labor and expense of rubbing.

Compo Tint—a quality flat wall finish made in eleven colors. Washable.

Flat White (Compo Coating)—an excellent wall finish which will tint to any color.

Hi Lite—Gloss, Eggshell, Flat—a white enamel for daylighting interiors of industrial plants, garages, etc.

P. W. M. Primer—a primer and sealer for plaster, wood, metal and porous surfaces.

Penetrating Oil Stain—made in seven standard shades.

Specialists in Fine Finishes

The HILO VARNISH CORPORATION has specialized in making fine architectural finishes since 1863.

Hilo products, each made for a specific purpose, have achieved fame for their honest quality. Their use assures satisfaction with the finished work.

Service

An experimental finishing laboratory, with experienced varnish chemists and wood finishers, is at the service of the architect. Sample finished wood panels and special varnished or enameled effects will be worked out and placed at the architect's disposal whenever requested.

We co-operate in drawing specifications to cover varnish, enamel and wall finishing work.

Specifications for Flat Wall Finishing on Plaster

New Work

No. 1 Priming Coat—Coat of Hilo P. W. M. Primer, reduced two parts P. W. M. Primer to one part turpentine or good turpentine substitute.

No. 2 Sealer Coat—Coat of a mixture of half P. W. M. Primer and half Hilo Flat White (or Compo Tint of color selected) reduced to brushing consistency.

No. 3 Body Coat—Coat of Hilo Flat White (or Compo Tint of color selected) as it comes in the can.

No. 4 Finishing Coat—Coat of Hilo Compo Tint of color selected, as it comes in the can.

Specifications for Gloss Wall Finishing on Plaster

No. 1 Priming Coat—Coat of Hilo P. W. M. Primer, reduced two parts P. W. M. Primer to one part turpentine or good turpentine substitute.

No. 2 Sealer Coat—Coat of a mixture of half P. W. M. Primer and half Hilo Flat White (Compo Coating), reduced to brushing consistency.

No. 3 Body Coat—Coat of Hilo Flat White (Compo Coating) as it comes in can.

No. 4 Finishing Coat—Coat of Hilo Hi Lite Gloss White Enamel as it comes in can. (Tint Hi Lite Gloss White to color selected.)

Specifications for White Enamel on Wood

New Work

Sand surface smooth and brush off clean.

No. 1 Priming Coat—Coat of Hilo P. W. M. Primer, reduced two parts P. W. M. Primer to one part turpentine or good turpentine substitute.

No. 2 Undercoat—Two coats of Hilo White Enamel Undercoat, allowing twenty-four hours between coats.

No. 3 Finishing Coat—One coat of Hilo Molmanite White Enamel as it comes in can.

(Note: If finishing coat is to be rubbed, sand lightly and apply additional coat. Allow three to four days between coats.)

Specifications for Daylighting Industrial Interiors

No. 1 Priming Coat—Coat of a mixture of half P. W. M. Primer and half Hilo Flat White (Compo Coating) reduced to brushing consistency.

No. 2 Body Coat—Coat of Hilo Flat White (Compo Coating).

No. 3 Finishing Coat—Coat of Hi Lite Gloss White Enamel.

For dado and wainscoting of wood, brick or concrete—two coats of Hilo Dado Enamel of color selected.

For floors of industrial interiors—two coats of Hilo *Speed-Up* Floor Enamel of color selected.

Varnish Specifications**New Exterior Woodwork**

Sand surface smooth and brush off.

Staining—Stain with Pigment Oil Stain.

Filler—Fill open grain wood with Hilo Paste Woodfiller. (Close grain wood requires no filler.)

Varnish Coat—Two coats of Hilo *Speed-Up* Spar Varnish, allowing six hours between coats and sanding lightly between coats. (If great depth of finish is desired specify third coat of Hilo *Speed-Up* Spar Varnish.)

New Interior Woodwork

Sand surface smooth and brush off.

Staining—Stain with Hilo Penetrating Oil Stain of color selected.

Filler—Fill open grain wood with Hilo Paste Woodfiller.

(Close grain wood requires no filler.)

Shellac Coat—Thin coat of shellac. Sandpaper smooth.

Varnish Coat—Two coats of Hilo *Speed-Up* Interior Varnish allowing six hours between coats. (Can be rubbed after twelve hours.)

(Note: On windowsills, store fronts and places exposed to strong sunlight omit shellac coat.)

Rubbed Effect without Rubbing

Follow specifications as for Interior Woodwork, omitting second coat of Hilo *Speed-Up* Interior Varnish and substitute coat of Hilo Flat Finish Varnish.

Specifications for Finishing Floors**New Work**

Sand surface smooth and brush off.

Filler—Fill open grain wood with Hilo Paste Woodfiller of color selected and sandpaper smooth. (Close grain wood requires no filler.)

Varnish Coat—Two coats of Hilo *Speed-Up* Floor Varnish allowing six hours between coats. (If great depth of finish is desired specify third coat of Hilo *Speed-Up* Floor Varnish.)

Specifications for Hilo *Speed-Up* Floor Enamel on Wood—Concrete—Composition Floors

Remove grease and oil spots and brush clean.

Apply two coats of Hilo *Speed-Up* Floor Enamel allowing six hours between coats.

Specifications for Enameling Iron Work

Clean surface removing all rust.

Apply two coats of Hilo *Speed-Up* Colored Enamel, of color selected, allowing six hours between coats.

General Specifications for Painting

General Conditions—The contracting painters shall be governed by the general conditions covering complete specifications for this building.

Specification of Work—Finishing all surfaces of wood, plaster, composition, concrete and unfinished metal throughout the interior of this building.

Materials—Materials shall conform exactly in brand as herein specified, and must be delivered at building in original containers with labels and seals intact.

Tint must have approval of architect for color, before applying.

Materials should not be thinned or changed in any way, except where specified or upon approval of architect.

Preparation of Surfaces—All surfaces shall be

thoroughly clean; free from dust and dry before applying finish.

Any surfaces to be finished which are not in satisfactory condition for finishing shall be reported to architect.

Nailholes, cracks, etc., shall be filled with putty of color to match the finish.

Workmanship—Workmanship shall be of the highest quality. All materials spread evenly and smoothly, flowed on without laps, sags or brushmarks.

During the finishing work, the contracting painter shall protect all adjacent work and materials by covering or other method. When finishing work is completed he shall clean all enamel and varnish spots from floor, glass and other surfaces.

Slogan

"The Interior Finishing Authorities"

Scope and General Information

S. C. JOHNSON & SON have been in business at Racine, Wisconsin, for nearly 50 years and occupy a unique position in the decorating industry. They do not attempt to cover the entire "paint" field but concentrate on a highly specialized line of Interior Finishes.

Each of these finishes is built on the old craftsman idea of doing one job 100% perfectly. Yet this old-fashioned plan is carried out in one of the most modern plants and finest laboratories in the country.

Johnson Finishes are standard in nine-tenths of American schools where manual training or vocational education are taught. And Johnson Specifications are the model for high grade construction.

Floor problems particularly have been a study of the Johnson organization. Johnson Electric Floor Polishers provide a modern and efficient adaptation of that ancient method of floor maintenance which has survived the test of centuries—*wax*. Write for the Johnson book, "The Proper Treatment for Floors."

Specifications for Finishing New Floors

Note: Specifications in italics are especially recommended.

(1) For Oak and Other Open Grain Woods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Paste Wood Filler on bare wood. (Filler may be natural or colored any shade to suit client.) Wipe off with burlap or excelsior across the grain and allow 24 hours to dry.

Second Coat—One coat of Johnson's Floor Lacquer flowed on with a full brush.

Third and Fourth Coats—Two coats of Johnson's Prepared Wax (Paste). Apply wax in thin coat, allow to dry 20 minutes or more, then polish thoroughly with Johnson's Wax Electric Floor Polisher. Allow one hour or more between coats. Maintain thereafter with Johnson's Liquid Wax.

Or—Two coats of Johnson's Floor Varnish may be used in place of wax, allowing 24 hours between coats. Sandpaper first coat with No. 00 sandpaper and dust off before applying second coat.

(2) For Stained Effects on Open Grain Woods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Wood Dye, shade to be selected by client.

Second Coat—One coat of Johnson's Paste Wood Filler—color selected by client.

Third Coat—One thin coat of pure shellac (2 lb. cut). Sandpaper very lightly with No. 00 sandpaper.

Fourth and Fifth Coats—Two coats of Johnson's Prepared Wax (Paste), allowing an hour between coats.

Or—Two coats of Johnson's Floor Varnish, allowing 24 hours to dry between coats. First coat to be sanded.

Note: Darkening floors through use of colored Paste Wood Filler is much easier than the use of stain unless very unusual color is desired.

Note: Do not use shellac or shellac substitute on floors except as absolutely necessary over oil stains.

Note: When varnish is used, apply one or two coats of Johnson's Liquid Wax subsequently, and maintain with the Liquid Wax, as cleaning will be greatly simplified and years added to the life of the varnish.

(3) For a Natural Finish on Maple, Pine, Birch, Gum, Poplar, Redwood, and Other Close Grain Hardwoods and Softwoods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Floor Lacquer, flowed on with a full brush.

Second and Third Coats—Two coats of Johnson's Prepared Wax, allowing an hour between coats.

Or—Two coats of Johnson's Floor Varnish in place of wax, allowing 24 hours to dry between coats. First coat to be sanded.

(4) For a Stained Effect on Maple and Other Close Grain Hardwoods and Softwoods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Lacquer Stain, shade to be selected by client.

Second and Third Coats—Two coats of Johnson's Prepared Wax.

Or—Two coats of Johnson's Floor Varnish, allowing 24 hours to dry between coats. First coat to be sanded.

Specifications for Finishing New Woodwork

(1) For a Natural Finish on Oak and Other Open Grain Woods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Natural Paste Wood Filler No. 10. Wipe off across the grain with burlap or excelsior and allow 24 hours to dry. (Johnson's Paste Wood Filler also made in mahogany, golden oak, dark oak, and Antwerp.)

Second Coat—One coat of Johnson's Floor Lacquer, flowed on with a full brush.

Third and Fourth Coats—Two coats of Johnson's Prepared Wax, allowing an hour or more between coats. Each coat to be polished with soft rag or Johnson's Polishing Mitt.

Or—Two coats of Johnson's Sani-Spar Varnish, allowing 24 hours between coats. First coat to be sanded with No. 00 sandpaper, and dusted before applying second coat.

Or—Two coats of Johnson's Floor Varnish, allowing 24 hours between coats. First coat to be sanded.

Or—One coat of Johnson's Floor Varnish and one coat of Johnson's Flat Varnish if a dull finish is desired. First coat to be sanded. Allow 24 hours between coats.

Note: If a rubbed finish is desired over Johnson's Sani-Spar or Floor Varnishes use pumicestone and oil or pumicestone and water, allowing 72 hours for last coat of varnish to dry before rubbing.

Note: A well polished coat of Johnson's Liquid Wax over any of the above varnish finishes adds a richness of effect, makes cleaning easier, and preserves the finish forever.

(2) For a Natural Finish on Softwoods and Close Grain Hardwood as Maple, Birch, Pine, Gum, etc.

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Floor Lacquer.

Second and Third Coats—Two coats of Johnson's Paste Wax.

Or—Two coats of Johnson's Sani-Spar or Floor Varnish on the bare wood. (May be rubbed if desired.) Allow at least 24 hours between coats. First coat to be sandpapered with No. 00 sandpaper.

Or—One coat of Johnson's Sani-Spar Varnish and one coat of Johnson's Prepared Wax.

Or—One coat of Johnson's Floor Varnish and one coat of Johnson's Flat Varnish if a dull finish is desired. First coat to be sanded.

(3) For Stained Effects on Open Grain Woods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Wood Dye, shade to be selected by client. Allow 12 hours to dry.

Second Coat—One coat of Johnson's Paste Wood Filler to match the stain. Wipe off across grain with burlap or excelsior to remove excess filler and allow 24 hours to dry.

Third Coat—One thin coat of pure shellac (2 lb. cut). Sandpaper lightly with No. 00 sandpaper.

Fourth and Fifth Coats—Two coats of Johnson's Prepared Wax, allowing an hour or more between coats.

Or—Two coats of Johnson's Sani-Spar Varnish or Johnson's Floor Varnish. Sand first coat with No. 00 sandpaper and allow 24 hours to dry. May be rubbed if desired.

Or—One coat of Johnson's Floor Varnish and one coat of Johnson's Flat Varnish for a dull finish.

Note: A simple stained effect on open grain woods can be most easily obtained by the use of colored paste wood filler just as specified for a natural finish under (1). The range of colors, however, is not as great as obtainable with the wood dyes as specified here.

(4) For Stained Effects on Close Grain Hard and Soft Woods

Preparation—Have the surface sanded smooth and thoroughly dusted. All nailholes and other defects shall be treated with Johnson's Crack Filler so as to render them unnoticeable.

First Coat—One coat of Johnson's Wood Dye, shade to be selected by client.

Second Coat—One thin coat pure shellac. Sand lightly with No. 00 sandpaper.

Third Coat—Two coats of Johnson's Prepared Wax. Allow an hour between coats.

Or—One coat of Johnson's Floor Varnish and one coat of Johnson's Flat Varnish for a rubbed effect.

Or—One or two coats (depending on body desired) of Johnson's Sani-Spar Varnish or Floor Varnish clear. May be rubbed if desired.

(5) For Interior Enamel Finish on Woodwork, Kitchens, Pantries and Bathrooms

Preparation—All nailholes and other defects to be puttied with lead and whiting putty. A light coat of white shellac should be applied on knots and all pitchy wood. Sand with No. 00 sandpaper and dust.

Priming Coat—One coat of Johnson's Perfectone Undercoat—thinned with 1 pint raw linseed oil, ½ pint pure spirits of turpentine, and 3 ounces white japan drier to 1 gallon of Undercoat. Brush out well and allow 24 to 36 hours for drying. Sand with No. 00 sandpaper and dust.

Second or Body Coat—One coat of Johnson's Perfectone Undercoat as comes in the can. If necessary to reduce, use pure spirits turpentine only. Apply freely, flowing it on, and allow 24 to 36 hours for drying. Sand with No. 00 paper.

First Enamel Coat—One coat of Johnson's Perfectone Enamel (Gloss or Satine) or Johnson's Glo-coat Enamel or Johnson's No. 25 Enamel. A flowing coat which has been reduced with ½ pint pure turpentine to the gallon. Allow this coat 4 or 5 days to harden. Sand lightly with No. 00 paper.

Finish Enamel Coat—Johnson's Perfectone Enamel or Johnson's Glo-coat Enamel or Johnson's No. 25 Enamel. A flowing coat as it comes in the can. This last coat may be rubbed with pumicestone and water if desired.

Note: For rush work use Johnson's Quick-Drying Perfectone Enamel.

Note: Care should be taken that building be well heated when applying material.

Note: If in any case only one coat of enamel is used, add one pint of enamel to each gallon of the preceding coat of undercoat.

Specifications for Finishing Walls

(1) For One-color Finish on Plaster

Preparation—Clean and dust off. Fill all cracks with paste made from equal parts of Permacote and plaster of paris.

First Coat—Johnson's Permacote (tinted to suit taste of client) reduced with equal parts Johnson's Wall Size Varnish or reduced with ½ gallon of pure boiled linseed oil to 1 gallon Johnson's Permacote. Allow 24 hours for drying. If suction or "hot spots" show through, touch up with above mixture.

Second and Third Coats—Apply Johnson's Permacote as it comes in the can (tinted to suit the taste of client). If thinning is necessary, use pure turpentine, not more than 1 pint to a gallon. May be stippled if desired.

(2) For One-color or Two-tone Finish on Textured Walls (over "Plastic Paints" or Sand-finish Plaster)

Preparation—Clean and dust off. Fill all cracks with heavy paste made from equal parts of Permacote and plaster of paris.

First Coat—Johnson's Permacote (tinted to suit taste of client) reduced with equal parts Johnson's Wall Size Varnish or reduced with ½ gallon of pure boiled linseed oil to 1 gallon Johnson's Permacote. Allow 24 hours for drying. If suction or "hot spots" show through, touch up with above mixture.

Second Coat—Apply Johnson's Liquid Wax Glaze (tinted with pure oil colors to suit client). "Pick up" glaze with soft cloth until desired effect is produced. Or for two-tone effect wipe off high spots until desired effect is produced. Allow to dry 24 hours and then polish thoroughly with bristle brush.

(3) For Two or More Colors on Textured Walls

Preparation—Clean and dust off. Fill all cracks with paste made from equal parts of Permacote and plaster of paris.

First Coat—Johnson's Permacote (tinted to suit taste of client) reduced with equal parts Johnson's Wall Size Varnish or reduced with ½ gallon of pure boiled linseed oil to 1 gallon Johnson's Permacote. Allow 24 hours for drying. If suction or "hot spots" show through, touch up with above mixture.

Second Coat—Apply base coat of Johnson's Liquid Wax Glaze (tinted with pure oil colors to suit client). Do not allow to dry before applying other colors.

Third Coat—Spot Johnson's Liquid Wax Glaze tinted to colors chosen by client, over the base coat. Then with clean soft cloth blend colors until desired effect is produced. Allow 24 hours to dry and then polish thoroughly with bristle brush.

Note: Gold and silver effects may be obtained by mixing small amount of gold or silver bronze powder in the natural Glaze and applying lightly with cloth on the high spots. Polish when dry.

HOCKADAY, INC.

A DIVISION OF THE MORGAN COMPANY

MANUFACTURERS OF
Washable Interior Paint

GENERAL OFFICES

20 North Wacker Drive, CHICAGO, ILL.

FACTORY

200 Voris Street, PEORIA, ILL.

Products

HOCKADAY, a washable semi-gloss wall paint.

HOCKADAY No. 186 REDUCER.

Where Hockaday Gives the Best Results

Hockaday produces a semi-gloss wall finish of unusual toughness, fineness and remarkable durability. It is non-porous and elastic and readily expands and contracts with the surface on which it is applied, thus preventing breaking or checking.

Hockaday has no equal for use over plaster, cement, brick, wall board, and other porous surfaces, and equally good results can be had on wood or metal surfaces. Because it is non-porous and may be washed repeatedly, without ill effects, Hockaday is an ideal paint for hospitals, schools, theatres, hotels and office and public buildings where long life and low maintenance cost is required. Both as a finish and as an undercoater for all materials, it is unexcelled.

What Hockaday Washable Wall Paint Is

Hockaday Paint is a mixture of opaque pigments and liquids, used as a coating principally to protect and beautify. Hockaday comes in two parts, Body and Reducer, or thinner. The body of Hockaday Paint is composed of the highest grade of zinc oxide and lithopone; a combination of specially prepared varnishes and oils comprises the liquid for the body. The body is about the consistency of unchilled butter.

Hockaday Reducer is composed of materials similar to the liquid of the body and, in painting, it is mixed in different proportions with the body to meet varying individual job conditions.

10 EXCLUSIVE FEATURES OF HOCKADAY

(1) **No Lime Burning**—The binder (the liquid that binds particles of pigment together and holds them to the wall) is the only binder that lime in plaster will not burn and destroy. The action of lime is neutralized and entirely overcome. It works the same on old as well as on new walls.

(2) **No Air Checks**—Both coats are the same. They have the same rubber-like elasticity, therefore, unlike paints where different undercoats are used, they contract and expand together.

(3) **No Peeling**—Applied according to our instructions, Hockaday will not peel.

(4) **No Size or Primer Used**—Hockaday is complete in itself.

(5) **Only Two Coats Required**—The foundation coat, which is also a color coat, seals the pores and stops all suction. New work in light shades requires three coats, two coats with colors on color card. The elimination of size often saves one-third material and one-third labor.

(6) **Easier to Apply**—Hockaday levels itself. Our instructions

read: "Do not brush out—flow on." This may not appear to be a major advantage, but it is. Hockaday takes less time to apply. A painter can turn out more squares per day.

(7) **Spreads Further**—Careful tests over a period of years, under varied conditions, prove this. Hockaday can be relied upon to spread ten percent further than average gloss or semi-gloss paint.

(8) **Really Washable**—When washing is mentioned, "sponging off" is not implied. Hockaday is really washable. Repeated washings do not mar its original beauty. Hockaday is non-porous. Microscopically it seals the wall with an enamel-like finish. A washed Hockaday wall looks clean and is clean. There are no pores for bacteria to lodge in. Hospitals especially like this sanitary feature.

(9) **Lasts Longer**—Hockaday has unusual durability. In hundreds of jobs throughout the country, it has been in use for more than ten years and is still in good condition.

(10) **Reduces Maintenance Costs**—The washability and long life of Hockaday reduces upkeep costs.

SUGGESTIONS FOR ARCHITECTS SPECIFICATIONS

It is recommended that the following "note" be incorporated by architects in their specification of Hockaday. Its use will do two things: Make certain that Hockaday is used; assure best results.

Hockaday—Whenever the word "Hockaday" is mentioned in this specification, it shall be the trademarked product manufactured only by HOCKADAY, INC., of Chicago, and shall consist of a foundation and finish coat as recommended by the manufacturers. Hockaday is to be delivered in unbroken original containers.

Application—All plastered surfaces are to be given two coats when colors are no lighter than those on regular color card (white or delicate tints take three) of Hockaday. Hockaday is to be applied in strict accordance with the manufacturer's printed specifications. Said manufacturer's specification (attached) is made a part of this specification. The painter must follow it without any deviation. Positively no thinner other than the reducer supplied by HOCKADAY, INC., is to be used. The application of glue or any size, before or between coats, on new or old surfaces, is strictly prohibited.

Stippling—The mixture should be a trifle heavier

than material used for brush coat finish. Let stand 20 to 30 minutes or until tacky.

The following paragraph is optional. If you consider it advisable, it should be included. It is taken in part from the Government specification of Hockaday:

"Two coats, without a size, must produce a surface of such a nature that air cracks, water stains, suction spots and lime burns must be overcome and from which defacements caused by grease, ink, match scratches or pencil marks may be easily removed by the use of soap and water or an abrasive washing compound, without injury to the paint surface."

Write the Hockaday Service Department, 20 No. Wacker Drive, Chicago, for further details regarding the advantages of Hockaday Washable Wall Paint. Upon request, we will gladly send you a test panel, also a copy of our beautiful reference book, "Decorations," which contains illustrations of numerous nationally-known jobs on which Hockaday is used.

MARTIN VARNISH COMPANY

"Pioneers of 100% Pure Varnishes"

TELEPHONE
VICTORY 7000

HOME OFFICE
2520 Quarry Street
CHICAGO, ILL.

CABLE ADDRESS
"MARTIN-CHICAGO"

Products

MARTIN'S 100% PURE* VARNISHES: Floor, Interior, Outside Spar and Velour.

MARTIN'S ENAMELS and ENAMEL UNDERCOAT.

MARTIN'S AMBER-LYTE—a penetrating finish and first-coater.

MARTIN'S LIGHT LINOLEUM VARNISH, PURE SHELLAC, LIGHTNING DRYER, PAINT and VARNISH REMOVER, etc.

*Note: Martin's 100% Pure Varnishes contain only pure fossil gums, turpentine and vegetable oils. No benzine, no rosin. Formula on every can.

A Complete Specification Book

A complete specification book, practical and informative in character and prepared with the co-operation of architects, will be sent on request. Other booklets: "Finishing Methods of the Old Master Craftsman" and "The Martin Enamel Finishing System."

Our Architect's Service Department

Our Architect's Service Department is prepared to co-operate with the architect and contractor in connection with special finishing problems.

A Representative Group of Martin Products

Specifications: General

Surface to be smooth, clean and dry. Liquid filler should never be used. Shellac should never be used except to seal penetrating or spirit dye-stains or cover pine knots.

Allow 24 hours for drying between coats of Amber-Lyte or varnish; 48 hours for enamel undercoat.

Number of Coats—Amber-Lyte gives penetration and reduction of first costs, while 100% Pure Varnish gives more body and higher luster. This should be borne in mind in specifying a given number of coats of either.

Specifications for Floors

No. 1. Open-grained Woods, Such as Oak—

(a) **Paste Filler**—To be thinned to creamy consistency with naphtha and brushed on. Before dry, to be wiped across the grain. To be sanded when dry with No. "O" sandpaper. Dust to be removed.

(b) **First Coat**—To be choice of Martin's 100% Pure Floor Varnish, thinned with 1 pt. of turpentine to the gallon of varnish and flowed on, or Martin's Amber-Lyte straight, brushed out thin.

(c) **Second Coat**—To be choice of Martin's 100% Pure Floor Varnish, flowed on straight, or Amber-Lyte straight, brushed out thin.

(d) **Third Coat**—To be Martin's 100% Pure Floor Varnish, flowed on full body.

No. 2. Close-grained Woods, Such as Maple, Birch, Beech, White, Red or Yellow Pine, and Cypress—

(a) **First Coat**—To be Martin's Amber-Lyte straight, brushed out thin.

(b) **Second Coat**—To be choice of Martin's 100% Pure Floor Varnish, flowed on straight, or Martin's Amber-Lyte straight, brushed out thin.

(c) **Third Coat**—To be Martin's 100% Pure Floor Varnish, flowed on straight.

No. 3. Rubbed Effect—

(a) **To Secure Rubbed Effect Without Labor Cost of Rubbing**—First coat, as above; second coat in every case to be Martin's 100% Pure Floor Varnish; third coat to be of Martin's 100% Pure Velour Finish, flowed on straight.

(b) **Alternative**—Three days after applying last coat of floor varnish, finish to be rubbed with pumicestone and oil.

Specifications for Public Building Floors

No. 4. Application—Three coats of Martin's Amber-Lyte, should be brushed out thin, allowing 24 hours for drying between coats, before sanding the surface and having it cleaned of dust.

(Note: Paste filler should be applied first on open-grained wood, as specified in 1-a.)

Specifications for Interior Woodwork

No. 5.—Specifications identical with those for floors, substituting Martin's 100% Pure Interior Finish for Floor Varnish.

Specifications for Exterior Finishing

No. 6.—Specifications identical with those for floors, substituting Martin's 100% Pure Outside Spar Varnish for Floor Varnish.

Specifications for Enamel Finishing (Interior or Exterior)

No. 7. Priming Wood (All Kinds)—Priming coat to be Monarch 100% Pure Paint, or equal, thinned with ½ gal. of pure raw linseed oil and ½ pt. of pure turpentine to the gallon of paint. Allow at least 24 hours to dry.

No. 8. Priming Plaster, Concrete, Cement, Brick, Stone, Plaster and Substitutes—

(a) **Preparation**—First, apply a solution of 3 lb. zinc sulphate crystals dissolved in a gallon of water. 24 hours to be allowed for drying.

Note: This neutralizes the alkali or "hot spots."

(b) **Priming**—A priming coat of Martin's Amber-Lyte, to be brushed out thin. Allow ample time for drying.

No. 9. Finishing Coats (To Be Used on All Materials)—

(a) **Second Coat**—To be Martin's Enamel Undercoat, full body. To be sanded after 48 hours with No. "00" sandpaper. Dust to be removed.

(b) **Third Coat**—To be Martin's Enamel Undercoat, full body, or mixture of Martin's Enamel and Undercoat (for ivory finish some of the color should be used in this coat). To be sanded after 48 hours. Dust to be cleaned up.

(c) **Fourth Coat**—To be Martin's Full Gloss Enamel (white, gray or ivory), or Martin's Eggshell Enamel.

(d) **Final Coat**—Exteriors only—An additional coat of Martin's Full Gloss Enamel to be applied.

MINWAX COMPANY, INC.

A Complete Service for Waterproofing, Dampproofing and the Preservation of Wood and Masonry

11 West 42nd Street, NEW YORK, N. Y.

BRANCH OFFICE: 232 East Erie Street, CHICAGO, ILL.

FACTORY: DELAWANNA, N. J.

For Representatives Refer to Local Telephone Directory and Paragraph on Last Minwax Page

Products

MINWAX BRICK and CEMENT COATING;
MINWAX METHOD of WOOD FINISHING.

We also make a full line of Waterproof-

ing and Dampproofing Products, Caulking Compounds, etc., for all general building construction purposes, for which see Manufacturers' Index.

MINWAX BRICK AND CEMENT COATING

For Waterproofing and Decorating Exposed Surfaces of Cast Concrete, Brick or Stucco—This Minwax product is a pigment coating produced in a series of attractive flat color tones. It is a combination of the highest grade inert mineral pigments obtainable in a carrying vehicle based on Minwax Clear Waterproofing (one of the oldest, best known and most efficient mediums for exposed wall waterproofing).

This vehicle not only binds the coating on the wall surface so that it stays put, but it penetrates and eliminates the porosity factor and thus prevents the possibility of a dusty, loose coating.

The coating penetrates and becomes part of the concrete or brick, and the Minwax Clear Waterproofing vehicle penetrates far below the surface and permanently waterproofs it.

The effect produced is flat, without a painty sheen. It changes the texture of concrete or stucco but slightly and maintains the tone of the structural material and gives it the fresh, clean, uniform color selected. On masonry and brick, it gives a whitewash effect.

Applied with a brush or spray. Handles with unusual ease. Covers rapidly and effectively.

Uses—Because Minwax Brick and Cement Coating is primarily a waterproofing, it is a very efficient means of decorating and beautifying concrete, brick or stucco and of preserving them from the disintegrating effects of water and frost.

Recommended also as a coating for light courts where a durable, fadeproof, white surface is desired.

Colors—Finished in 11 standard colors: white, cream, yellow, cement gray, limestone gray, caen stone, green, brown-stone, terra cotta, water blue and brick red. Special colors extra.

Covering Capacity—Varies between 160 and 250 sq. ft. per gal. per coat, depending upon the roughness and porosity of the surfaces to be treated.

How Shipped—In 1, 5, 30 and 55-gal. containers.

Specifications

General—All surfaces shall be thoroughly dry, clean and sound subject to the approval of the painter before work proceeds. This contractor shall immediately before applying material, brush surface to remove dust, sandy and loose material. No work shall be carried forward at temperature below 45° F.

All exposed surfaces as directed shall receive two thorough coats of Minwax Brick and Cement Coating, color as selected, re-touching first coat, if required, for uniform color. First coat shall be thinned with Minwax Brick and Cement Coating Thinner only, as required to insure full penetration and obtain satisfactory coverage for second coat. Painter shall test surface to determine proper percentage thinner. When first coat is dry light spots shall be retouched as necessary to produce uniform color. Second coat shall be applied straight without thinning or adulteration.

Painters shall carefully point up all holes, cracks, or joints, after application of the first coat, rubbing them full of Minwax Pointing Paste in color to match the color of Minwax Brick and Cement Coating selected. After point painting the cracks shall be brushed to remove surplus and re-touched to uniform appearance.

Note: Especially important that parapets and horizontal surfaces should be done with the greatest care. Two coats are ample on average sound surfaces. On especially porous, or sandy or disintegrated masonry surfaces, three coats are recommended. First coat should be thinned 50% with thinner, second coat approximately 20%, final coat should be applied without thinner.

Newly Laid Brick Walls or New Cast Concrete Surfaces—Where the masonry is green and new and proper time for curing (heavy cast concrete sections 90 days, brickwork 60 days, stucco 30 days) cannot be allowed, apply one coat of neutralizer consisting of 2 lb. of zinc sulphate dissolved in 1 gal. of water. Saturate surface thoroughly using 1 gal. to 150 sq. ft. and allow to dry thoroughly before applying coating.

Old Work—A sound solid surface must be obtained to get satisfactory service from coating. Wire brush surface thoroughly and repair and repoint all loose mortar or concrete. Use Minwax Pointing Paste for filling small cracks and holes.

SUPPLEMENTARY MATERIALS

Minwax Brick and Cement Thinner

This product is a thin liquid, produced from the vehicle or liquid portion of Brick and Cement Coating, to be used for thinning or reducing the first coat to insure penetration and otherwise as necessary.

How Shipped—1, 5, 30 and 55-gal. containers.

Minwax Pointing Paste

This product is a special waterproof putty for filling cracks in concrete, stucco or brick surfaces which are to be coated with Brick and Cement Coating. This material should always be used only after the first coat has been applied and is of proper consistency so that it can be rubbed into small cracks. Where larger cracks occur a very stiff paste of neat portland cement and water should be mixed with Minwax Pointing Paste to bring it to the desired consistency.

Care should be exercised not to smear this material over the surface and all cracks should be cross-brushed with a stiff brush to remove all surplus. Large cracks and spalled places should be repaired with portland cement mortar.

Colors—Made in same colors as Brick and Cement Coating.

How Shipped—1-gal. and 5-gal. pails.

Covering Capacity—On stucco and concrete depends on amount of cracking. Always have some on scaffold. Average brick usually requires gallon to 1000 to 2000 sq. ft. surface.

Neutralizer

For neutralizing the alkalis in green concrete, stucco, and mortar, for preaging the surface and assuring a stable foundation for the Brick and Cement Coating, a solution of zinc sulphate in proportion of 2 lb. to 1 gal. of water should be used. We can furnish the ready mixed Neutralizer where desired. For best results neutralizer should be used on all surfaces less than 90 days old.

Minwax Transparent Waterproofing

Where the natural color of any masonry surface is to be preserved by waterproofing treatment, use Minwax Transparent Waterproofing. Full description and specifications for this product will be found in another section of this edition. See Manufacturers' Index.

MINWAX METHOD OF WOOD FINISHING

A Complete Preservative Finish for Wood Floors and Trim

Introduction—The Minwax Method of Wood Finishing differs from and offers real advantages over all other methods by simplifying procedure, reducing labor, and by applying to modern conditions the age-old principles by which those rich, soft, wax effects, associated with early English and early Colonial times, were obtained. The excellence of Minwax Method, equally applicable to floors, interior trim, or outside woodwork, and to all kinds of wood, is proven by nearly twenty years of use.

Advantages—The Minwax Method places the finish in and not on the wood and does so, generally, in two easily applied coats. It has been developed around a combination of special preservative oils, gums and waxes which penetrate together. By combining with this finish natural wood stain colors, those more mellow, deeper tones of brown which are so deservedly popular, are produced. The penetrative nature of the finish carries these colors intimately into, around and between the surface fibres, so that the color is an integral part of the surface.

This combination of penetrative finish and color is the Minwax Method's unique contribution to wood finishing, producing effects that are more natural, that more truly enhance the natural charm of the wood. Since by this method all is in the wood, a finish that more effectively resists abrasion and which is simpler to maintain is produced.

Materials—While in the Minwax Method there is generally but one material to use, Minwax Flat Finish, supplementary materials have been developed so that the advantages of the Method are available under all conditions regardless of the speed required, the color or degree of lustre desired, etc. So long as the wax type of finish is wanted, it can be efficiently and beautifully obtained by the Minwax Method.

Minwax Flat Finish

This material is a combination of certain carefully blended oils, gums and mineral waxes. It penetrates the wood and deposits tough mineral gums inside and up to the surface. It is produced in natural and in a series of seven stain colors, so that the complete result is created by two coats of one material, the color being determined by the particular shade selected.

Its mineral base is a distinctive characteristic and makes it resistant to all deteriorating agencies. Its efficiency as a protective and preservative treatment is proven by twenty years on industrial and school floors.

(See our catalogue in Manufacturers' Index.)

Being penetrative in character both as to color and finish, its curing is gradual and while the surfaces are usable almost immediately, it constantly improves in lustre, hardness and quality with age. Its penetrative character makes it possible to maintain worn spots to renew the finish by simple wipings with the same material and, as a result, a re-scraping should never be necessary.

Colors—No. 9 (natural); No. 11 (light oak); No. 12 (dark oak); No. 13 (walnut); No. 716 (dark walnut); No. 750 (Jacobean); No. 15 (green); No. 16 (mahogany).

Covering Capacity—500 to 800 sq. ft. per gal. per coat.

How Shipped—Quart, gallon, 5-gal., 30-gal., and 55-gal. containers.

Minwax Quick Drying Flat Finish

For some conditions, however, the construction schedule or the fact that the rooms must be lived in during refinishing, demand that the final ultimate results must be produced more rapidly than is possible even with Standard Minwax Flat Finish.

For these conditions, Minwax Quick Drying Flat Finish has been developed, and by its use the final complete high lustre can be had in twenty-four hours. It differs from standard Minwax Flat Finish in only one way: it carries preserving, binding gums deeply into the surface, but does not, as does Minwax Flat Finish, at the same time carry the wax into the surface, but with the Quick Drying Flat Finish the waxing operation must be carried on separately, using Minwax Finishing Wax.

Colors—No. 209 (natural); No. 211 (light oak); No. 212 (dark oak); No. 213 (walnut); No. 2716 (dark walnut); No. 2750 (Jacobean); No. 215 (green); No. 216 (mahogany).

How Shipped—Quarts, 1, 5, 30, 55-gal. containers.

Minwax Finishing Wax

Minwax Finishing Wax is a special wax, which is made in both paste and liquid form, and it is designed for those owners who prefer a high, lustrous polish to the soft, deep velvety finish produced by Minwax Flat Finish. Also, our paste wax is produced for use over our Quick Drying Flat Finish under all conditions—where its use is an integral part of the treatment. The Paste Type is the one to use for the first waxing operation. The Liquid Wax is the material to use for cleaning and general maintenance.

How Shipped—Paste: 1, 4, 8 and 35-lb. cans. Liquid: 1 qt., ½ gal., 1 gal. and 5-gal. cans.

Covering Capacity—Paste: 250 to 350 sq. ft. per lb. Liquid: 700 to 1000 sq. ft. per gal.

Minwax Acid Stain

Minwax Acid Stain is a true water stain, so that those owners who desire the weathered, fumed tones or those uniform colors that minimize the grain and pattern which can be produced in no other way, can obtain them by the use of a product scientifically designed to function with Minwax Flat Finish.

The Acid Stain produces simply the color effect, it adds no protection or finish, Minwax Flat Finish being applied over it for preservation and finish.

Colors—No. 120 (light fume); No. 122 (Flemish); No. 123 (dark fume).

Covering Capacity—300 sq. ft. per gal.

How Shipped—½, 1 and 5-gal. glass containers.

How to Specify the Minwax Method

For Average Conditions—Wood shall be clean, free from all shellac, varnish, or other finish, dry, and carefully sanded. Apply Minwax Flat Finish, color as selected, with a brush; wiping each coat thoroughly to remove surplus, in not less than two or more than six hours. Allow at least twelve hours between coats. On floors, polish with a weighted brush or electric polisher after the second coat has cured for four or five days, or just before occupancy. The final wiping is most important—the surface must be thoroughly rubbed to remove all surplus. The finished surface shall be dry and shall show a uniform sheen.

Where a high polish is desired, use Minwax Finishing Wax (Paste) but allow the second coat of Flat Finish to cure and harden at least ten days before waxing and polishing.

Where High Speed Is Necessary—Wood must be clean, dry, and prepared to receive the finish by sanding, and be free from wax, varnish, shellac, or other finish. Minwax Quick Drying Finish is designed to be used only on raw wood or over itself. Apply two coats of Minwax Quick Drying Finish (color as selected), spreading in a heavy, even coat well worked

in. Allow each coat to stand fifteen or twenty minutes, until the material has sufficiently penetrated the wood, and then with clean cloth remove the excess from the surface, at the same time rubbing out all laps or unevenly coated spots. Allow twelve hours between coats. Twelve hours after the final coat apply an even coat of Minwax Finishing Wax (Paste) as a final operation and polish with an electric polisher.

For conditions where only the shortest possible time may be allowed, omit second coat of Quick Drying Flat Finish and proceed as above.

Fillers—Fillers are not required with the Minwax Method. If desired they can be used in the usual way after the application of the first coat. The filler should be colored to match the stain color of Flat Finish selected.

Minwax Finishing Wax Specifications—Apply a thin even coat with a rag and polish when dry (15 to 30 minutes).

Minwax Acid Stain Specifications—Apply in even coats with a brush or sponge. Sand lightly with steel wool or 00 sandpaper, and when dry, finish with Minwax Flat Finish No. 9, or as necessary for the desired effect.

MURPHY VARNISH COMPANY

MEMBER OF THE PRODUCERS' COUNCIL

NEWARK, N. J.

CHICAGO, ILL.

SAN FRANCISCO, CAL.

MURPHY FINE FINISHES

Famous for 66 years among Architects, Master Painters, and Makers of Products Requiring a Fine Finish

Varnish and Enamel Products

Murphy Transparent Interior Varnish—

A fine transparent, lustrous varnish which brings out the grain of the wood, flows freely, covers a great deal of surface, rubs easily, and keeps in full beauty for many years.

Murphy Nogloss Interior Varnish—

This varnish, used for the final coat over Murphy Transparent Interior, gives a rubbed effect without the labor of rubbing. Beautifully shows the grain of the wood. Can be used alone by applying the proper number of coats.

Murphy Transparent Floor Varnish—

A fine free flowing varnish that rubs easily, producing a smooth, beautiful surface. Does not flake off; it is not affected by reasonable exposure to moisture, air or water. An extremely tough and long wearing floor varnish which has scored 100 in many tests.

Murphy Airplane Super Spar Varnish—

A spar varnish that dries for same day recoat. It dries out of dust in 2 hours and is tough and hard, ready for recoating in 4 to 6 hours. As to appearance of finish, we admit that it rivals the finest of our own long drying varnishes.

We recommend it highly for outdoor and indoor floor and trim work.

Murphy Murenic White Enamel—(Gloss or Semi-gloss)—

A pure white enamel of the finest grade and long life. Designed for use either indoors or outdoors. Also furnished in gray or ivory tints.

Murphy Quick White Enamel for Master Painters—

This product is a good appearing, good wearing and good working enamel which dries quickly. When used in conjunction with Murphy Velvet White Enamel Lacquer for Master Painters, a beautiful four-coat, gloss finish is possible in two days.

Murphy White Enamel Undercoating No. 37—

No. 37 White Undercoating is intensely white, and so deep in its hiding quality that on lesser important jobs all that is necessary is a single enamel finishing coat. It dries quickly.

Murphy Konkreto—

For the sanitary treatment of concrete or cement floors, walls, or ceilings. Gives smooth surface. Prevents them from wearing, dusting and getting moldy.

TRADE SYMBOL

Makes them as easy to clean and keep clean as tiling.

Murphy Waterproof Mixing

Shellac plus Murphy Waterproof Mixing makes a material of remarkable property—better than shellac in every way.

You mix Waterproof Mixing with shellac—equal parts of each or 2 parts shellac and 1 part Murphy Waterproof Mixing—according to the job. The mixture is applied the same as ordinary shellac.

Prevents the shellac from turning white; increases the elasticity of finish; has better flowing qualities; dries as quickly as shellac; builds a fuller finish; greatly increases durability; absolutely waterproofs; cuts sanding cost; seals as well as shellac; increases anchorage, due to better pore penetration; prevents shellac from scratching white; eliminates pinholing.

Pyroxylin Products

Murphy Velvet White Enamel Lacquer for Master Painters—

This material is essentially a combination of varnish, enamel, and lacquer. It may be tinted to any desired pastel shade with pure linseed oil colors, preferably Murphy Oil Colors. It is possible to secure three very desirable finishes with this product; namely, a velvet finish, a soft luster finish, and a gloss finish.

The finest work with this finish may be completed in two days, two coats a day.

Murphy Durable Floor Lacquer—

This material is an absolutely distinctive chemical combination of varnish and lacquer. It may be brushed or sprayed. When thinned with Murphy Lacquer Thinner for Master Painters, Murphy Durable Floor Lacquer is a very efficient sealer for porous surfaces, for use under pigmented lacquers. It may be tinted with Murphy Japan Color to secure almost any shade. It is tough and elastic, inoffensive in odor, dries quickly typical of lacquer, making it possible to apply three coats in one day.

Free Literature

The MURPHY VARNISH COMPANY has prepared the following booklets which will be sent free to architects upon request:

Twentieth Century Art
French Interiors and Their Modern Adaptation
Murphy Specification Manual

SPECIFICATION GUIDE FOR FINISHING WOOD, PLASTER AND CONCRETE SURFACES

For Wood Finishing with Varnish or Enamel**Interior Work—**

Mahogany, Oak, White Mahogany, Walnut, Ash, Butternut and All Open Grained Woods—To be properly filled with MURPHY VARNISH COMPANY'S Paste Filler, care being taken to have filler match the natural color of the wood or the color desired by owner or architect; to receive 1 coat of shellac (except on floors, in bathrooms and laundries) and 3 coats of Murphy Transparent Interior Varnish or Airplane Super Spar Varnish. Shellac coat, and first and second coats of varnish to be sandpapered with 00 sandpaper; the third coat of varnish to be carefully rubbed with pumicestone and water to a dead and even surface (finisher to use rubbing felt), then oiled and thoroughly wiped, where necessary. Where gloss finish is desired, omit rubbing on final coat.

Pine, Maple, Cypress, Whitewood, Cherry, Birch, Sycamore, Beech, Holly and All Close Grained Woods—To be finished same as above, except that the filler be omitted.

For a Dull Finish without Rubbing—Wood to be brought up same as above, except that 1 coat of Murphy Nogloss Interior Varnish be used in place of the final coat of Murphy Transparent Interior Varnish or Airplane Super Spar Varnish.

For a Semi-gloss Finish, without Rubbing—Wood to be brought up same as above, except that 1 coat of Murphy Semi-gloss Interior is to be used in place of the final coat of Murphy Transparent Interior or Airplane Super Spar Varnish.

Floors and Bathrooms—All open grained hardwood floors in bathrooms to be properly filled with MURPHY VARNISH COMPANY'S Paste Filler, and receive 3 coats of Murphy Transparent Floor Varnish, the last coat to be rubbed lightly with oil and pumicestone. Thin the first coat with turpentine in the proportion of 1 pt. to 1 gal. of varnish. Pine, maple, cherry and all other close grained woods, used for floors, to be finished precisely as above, except that filler is to be omitted.

For a Dull Floor Finish without Rubbing—Floors to be treated as above, except that 1 coat of Murphy Velvet Floor Varnish is to be used in place of the final coat of Murphy Transparent Floor Varnish or Airplane Super Spar Varnish.

Enamel Work—

Treatment of White Enamel Work—First, give the wood a thin coat of shellac, lightly sandpaper when dry, and follow with 2 coats of Murphy White Enamel Undercoating No. 37 and 2 coats of Murphy Muroic White Enamel, the last coat to be rubbed down to a fine surface with either pumicestone and water, or rottenstone and water. Omit rubbing on final coat, if gloss finish is desired. (Muroic Enamel is also supplied in gray and ivory.) If a special color is wanted, tint with MURPHY VARNISH COMPANY'S Japan Color.

For a Semi-gloss White Enamel Effect without Rubbing—Treat work as above except that 1 coat of Murphy Muroic Semi-gloss Enamel is to be used instead of the final coat of Murphy Muroic Enamel.

Exterior Work—

The surface of all woods must be sandpapered smooth and properly cleaned before finishing. No shel-

lac to be used on outside work, inside sash, window sills, floors or other surfaces exposed to great dampness. Use 3 coats of Murphy Transparent Spar Varnish or Airplane Super Spar Varnish for all the above work. The first coat to be applied directly on the wood, if it is close grained, or after the wood is filled, on open grained wood.

For Wood Finishing with Pyroxylin Materials**Lacquer Specifications for Open and Close Grained Woods—**

If the wood is to be stained apply one coat of Murphy Permanent Stain, sanding is not necessary; then two or more coats of Murphy Durable Floor Lacquer allowing three or four hours between coats. This finish is a soft gloss.

Open grained woods must be properly filled with Murphy Paste Filler.

For a dull finish go over the last coat of lacquer lightly with 00 steel wool.

An attractive and inexpensive lacquer finish is secured by applying 2 coats of Murphy Durable Floor Lacquer. The second coat should be steel woolled. The job may be finished in a day without hurry. This is not a filled job, but in such work where a low cost is important and a natural finish desired it will be found to give entire satisfaction.

Finest Enamel Lacquer Finish—

(1) Apply 4 coats of Murphy White Enamel Lacquer for Master Painters. Allow 3 to 4 hours between coats. This finish has a soft velvet gloss.

(2) Moss off the first coat with No. 00 steel wool.

(3) If a semi-gloss is desired, mix with the last coat of lacquer enamel equal parts of Murphy Durable Floor Varnish.

The finest work with this finish may be completed in 2 days, 2 coats a day. Where a high luster is necessary, proceed as above, substituting for the fourth coat of lacquer a coat of Murphy Quick White Enamel for Master Painters or Murphy Muroic White Enamel. Any tint of Enamel Lacquer may be secured by mixing with Murphy Velvet White Enamel Lacquer for Master Painters enough Murphy Oil Color to give it the desired tint.

For Finishing Plaster Walls

(1) Plaster walls should be thoroughly dry before the application of any finishing material.

(2) Apply one sizing coat of Murphy Murlox. Allow 24 hours to dry.

(3) Apply 2 or 3 coats of Murphy Flowell according to the nature of the surface, allowing overnight dry between coats.

Flowell is supplied in white only. It may be tinted with oil or japan colors to any desired shade.

For Finishing Concrete Surfaces

(1) All concrete must be thoroughly dry before the application of a finishing material, as no type of finishing material will adhere to damp walls successfully.

(2) Apply 2 coats of Murphy Konkreto allowing overnight dry between coats. Supplied in appropriate colors.

Products

WHITE LEAD (Dry and in Oil); RED LEAD (Dry, in Oil, Liquid); WALL PRIMER; LINSEED OIL (Raw and Boiled); FLATTING OIL.

White Lead for General Painting

Gloss paint made of pure white lead and pure linseed oil has long been the standard protective and decorative coating for exterior wood, brick, stone, concrete and stucco. It forms a tough, tenacious film that does not crack and scale but wears down smooth and even, leaving the surface ready for repainting without expensive preparation. Being mixed to order, lead-and-oil paint can be adapted to meet all exposure, surface and weather conditions. It can also be varied in color from white to any desired shade or tint by the addition of the proper colors-in-oil.

Our Dutch Boy White Lead is guaranteed to be pure white lead ground in pure linseed oil. It is obtainable in the regular or heavy paste form and also in soft paste form. (The soft paste, known as Dutch Boy *soft paste* White Lead, contains three-quarters of a gallon more oil to the 100 lbs. of paste than does the heavy paste. This makes it softer or easier to thin, saving the user time and labor in mixing.)

Both the heavy paste and soft paste are sold in 100-lb. steel kegs and 50, 25 and 12½-lb. steel pails.

Dutch Boy Linseed Oil is pure, clear, carefully filtered and well settled. Sold in 1 and 5-gal. sealed cans bearing the Dutch Boy trade-mark. Our linseed oil is also obtainable in half barrels and barrels.

Flat Finishes for Interiors

Most inside painting nowadays is done in either flat or eggshell gloss finishes, such as are obtainable by reducing heavy paste white lead to brushing consistency with Dutch Boy Flattening Oil.

When white lead is thinned with flattening oil an interior paint results which possesses many points of excellence. It has good working and hiding qualities. It is easy to apply. It levels itself nicely, leaving no brush marks. It sets slowly, so that large areas can be worked without risk of laps or joints.

Some of the finest interior decorating jobs in the country have been done with white lead and flattening oil paint. The beauty and charm of the finish it gives, the all-around economy of this paint and its thorough washability recommend it for all types of interior work—plain wall finishes, mottled, figured and textured effects, the tiffany, etc.

The washability of a white lead and flattening oil finish is a point that should not be overlooked. This paint can be washed without injury not only a few months after it is applied but throughout its long life.

TRADE-MARK

Its pigment, white lead, is insoluble in water and remains so, not changing chemically under normal exposure indoors. Thus there is no unsightly streaking due to washing off of some of the pigment.

Dutch Boy Flattening Oil is sold in quart, gallon and 5-gal. cans sealed at the spout.

Wall Primer

There is a demand in interior painting with white lead for a primer that serves as both a sealer and a coat of paint. Dutch Boy Wall Primer meets these requirements.

Dutch Boy Wall Primer is a *paint* made with a special long oil vehicle of varnish type. It stops suction, seals fire cracks, and, at the same time, gives good hiding. It has the elasticity, adhesion and other qualities of an oil primer, combined with the recognized sealing property of a varnish primer, producing an ideal foundation for succeeding coats.

Dutch Boy Wall Primer brushes easily as it comes from the can and has a normal spreading rate of 800 square feet per gallon on smooth plaster surfaces. The ease in brushing and extremely high spreading rate of Dutch Boy Wall Primer effect a real economy on every job. Furthermore, the primer, because of its fine flowing and leveling qualities, leaves no laps, brush marks or other mechanical blemishes.

In full containers, Dutch Boy Wall Primer does not skin over or settle in the can. The pigment portion is always in suspension and the primer is ready for immediate use, requiring only the addition of tinting materials to form a ground of desired color.

Sold in 5, 1 and ½-gal. cans.

White Lead and Oil Plastic Paint

The trend is away from excessively rough surfaces as wall finishes but modified textures are gaining in popularity. This latter type of textural effect can be produced readily with a white lead and oil plastic paint. Such a paint is made with materials that the painter always has in his shop, is relatively low in cost and gives a finish that is durable and can be kept clean by washing.

The formula for white lead and oil plastic paint is 100 lb. Dutch Boy White Lead (heavy paste), 22 lb. dry whiting, 1½ gal. Dutch Boy Flattening Oil and ¼ pt. drier. This formula, making about 5¼ gal. of paint, will cover from 100 to 200 sq. ft. of wall surface when spread to a thickness about equal to two ordinary paint coats.

If soft paste white lead is used, mix the plastic paint as follows: 100 lb. Dutch Boy White Lead (soft paste), 44 lb. dry whiting, 1¾ to 2 gal. Dutch Boy Flattening Oil and ¼ pt. pure drier. This formula makes about 7¼ gal. of paint.

The resulting paint in both cases, although heavy, will brush out with comparative ease, after which it may be manipulated with a paint brush, whiskbroom, sponge, or any other means to give the texture desired.

The plastic paint prepared as described may be tinted prior to application, or may have colors-in-oil worked into it while it is still wet. The finish sets up overnight and can easily be glazed to lend additional color interest. No size coat is necessary to permit glazing.

When white lead and oil plastic paint is to be applied to new plaster walls, it is recommended that the walls first receive the customary priming coat. If the walls have been previously painted, and are in satisfactory condition for repainting, the plastic finish may be applied direct.

A booklet giving full information about white lead and oil plastic paint, and showing various textures in color, will be sent to any architect upon request.

Red Lead for Metal

Pure white lead, properly thinned to suit the special conditions under which the paint is to be used, gives the best protection for wood and other building materials except metal. When it comes to the painting of metal, white lead (though good for the purpose) must yield first place to pure red lead.

The chief requirements of a protective coating for metal are that it should have the ability to stick firmly to metal and that it should keep moisture which combined with air forms rust, from getting through. The paint must also be able to resist the destructive action of atmospheric gases, acid from the surface oil, and salt spray near the seacoast.

Paint made of pure red lead meets these requirements. It is insoluble in water, unaffected by ordinary atmospheric gases, adheres closely to metal, and is a true rust preventive.

A great advance in the quality of red lead was made when Dutch Boy Red Lead was perfected. It is a more highly oxidized product than old style dry red lead and is sold in paste form, ready for use after the addition of more linseed oil. Its exceptionally high true red lead content and the fineness of its pigment particles insure a paint of excellent brushing qualities, good coverage and extreme durability. Sold in 100-lb. steel kegs and 50, 25 and 12½-lb. steel pails.

The same highly oxidized red lead can also be had in liquid form. The liquid product is called Dutch Boy *liquid* Red Lead and is ready for use. It comes in natural red lead color, light and dark brown, light and dark green, and black. Sold in 1-gal. cans and 2½-gal. kegs.

We also make dry red lead of the highest grade.

General Painting Specifications

Following are general specifications for the painting of interior and exterior surfaces:

Preparation of Surface—(1) Woodwork—New woodwork shall be smoothed off with sandpaper where required and dusted clean before priming. From old woodwork which has been painted before, all loose paint, scale, dirt and dust shall be removed. Wash off with benzine or turpentine all parts where liquid paint remover has been used.

Before priming new woodwork, all knots and sappy streaks shall receive one coat of pure alcohol shellac, brushed out thin. After the priming coat is thoroughly dry, putty up all knot holes, dents, cracks, and other defects with putty composed of white lead and whiting.

(2) Plaster—Before applying any paint to plaster, either new or old, see that it is clean and smooth. Fill all cracks with approved patching plaster. Where new plaster to be painted is not properly aged, it shall be treated before priming with a solution made by dissolving 2 lbs. of zinc sulphate in 1 gal. of water.

(3) Brick and Stone—New brickwork shall not be primed

until dry. At least 2 or 3 days of dry weather should precede painting. If any mortar has become loose or washed out, repoint all such damaged places with mortar or portland cement before applying paint. After priming, correct small defects in the surface with putty.

(4) Stucco and Concrete—Stucco or concrete should be allowed to stand and dry a year before paint is applied. If painted within a year, it shall be aged artificially by washing with a solution made by dissolving 2 lbs. of zinc sulphate in 1 gal. of water, or with carbonic acid water.

(5) Metal Work—Iron, steel and other metal work shall be cleaned thoroughly of all loose paint, dirt, oil, grease, rust, scale and other foreign matter before paint is applied.

The Paint and Its Application—(6) Designation of Paint to Be Used—All woodwork, plaster, brick, stone, concrete and stucco which are to be painted, shall be painted with NATIONAL LEAD COMPANY'S Dutch Boy White Lead, Dutch Boy Flattening Oil, pure linseed oil, pure turpentine and pure drier mixed according to the formulas hereinafter designated for each kind of work. All metal shall be painted with NATIONAL LEAD COMPANY'S Dutch Boy Red Lead-in-oil, Dutch Boy liquid Red Lead, or pure dry red lead and pure linseed oil mixed according to formulas hereafter given for each specific purpose.

(7) Tinting Materials—In producing tints and shades, John T. Lewis & Bros. Co. colors-in-oil or those of equally high grade shall be used. If colors-in-oil are used in quantities large enough to affect the consistency of the paint, the quantities of thinners named in the formulas shall be increased in amount equal to one-half the weight of the tinting material.

(8) Applying the Paint—No exterior painting shall be done when rain or snow is falling, during fog, or until after dew or moisture which may be on the surface has completely disappeared. Painting done in winter weather shall only be done when the temperature is above 50° F. and when all surfaces are dry. All exterior work shall be allowed to dry from 2 to 4 days before the next coat is applied and at least 24 hours shall be allowed between coats on interior work.

Formulas—The following white lead formulas take no account of tinting materials. See Paragraph No. 7 when adding colors to the formulas.

It will be noted that the formulas for painting exterior wood are on the basis of Dutch Boy *soft* paste White Lead as well as heavy paste white lead. For flat effects inside, the heavy paste is to be preferred as the higher oil content of the soft paste will give more of a sheen to surfaces painted with it.

(9) New Woodwork Outside—Three coats of paint, mixed as follows, shall be applied to new unpainted woodwork outside:

	(a) Priming coat		(b) Second coat	
	Heavy Paste	Soft Paste	Heavy Paste	Soft Paste
Dutch Boy White Lead	100 lb.	100 lb.	100 lb.	100 lb.
Pure raw linseed oil	4 gal.	3¼ gal.	1½ gal.	¾ gal.
Pure turpentine	2 gal.	2 gal.	1½ gal.	1½ gal.
Pure drier	1 pt.	1 pt.	1 pt.	1 pt.
	(c) Third coat			
	Heavy Paste	Soft Paste		
Dutch Boy White Lead	100 lb.	100 lb.		
Pure raw linseed oil	3 to 4 gal.	2¼ to 3¼ gal.		
Pure turpentine	1 pt.	1 pt.		
Pure drier	1 pt.	1 pt.		

Note: The painter may exercise his discretion in using a larger or smaller quantity of oil according to whether the wood is oil absorbing, such as redwood, white fir, sugar pine, western red cedar and hemlock, or less absorbent, such as southern yellow pine, white spruce, Alaska cedar and cypress. The painter may, in rare cases, find it advisable to increase the quantity of turpentine for extremely sappy or resinous woods. Where this is done, a corresponding decrease should be made in the specified amount of linseed oil.

(10) Old Woodwork Outside—Two coats of paint as follows shall be applied in repainting old woodwork outside:

	(a) First coat		(b) Second coat	
	Heavy Paste	Soft Paste	Heavy Paste	Soft Paste
Dutch Boy White Lead	100 lb.	100 lb.	100 lb.	100 lb.
Pure raw linseed oil	2 gal.	1¼ gal.	3 to 4 gal.	2¼ to 3¼ gal.
Pure turpentine	2 gal.	2 gal.	1 pt.	1 pt.
Pure drier	1 pt.	1 pt.	1 pt.	1 pt.

(11) **New Woodwork Inside**—Three coats of paint, mixed as follows, shall be applied to new unpainted woodwork inside:

	(a) Priming Coat	(b) Second coat	(c) Third coat (Flat finish)	(d) Third coat (Eggshell gloss finish)
Dutch Boy white lead (heavy paste)	100 lb.	100 lb.		
Dutch Boy flatting oil	3 gal.	2 to 2½ gal.		
Pure raw linseed oil	3 gal.	None		
Pure drier	1 pt.	None		
Dutch Boy white lead (heavy paste)	100 lb.	100 lb.		
Dutch Boy flatting oil	2 to 2½ gal.	1½ to 2 gal.		
Floor varnish	None	¾ gal.		

Note: As on outside wood, the painter may exercise his discretion in the use of the thinners prescribed—thus on white pine, poplar and basswood, which more readily absorb oil, increase the quantity of linseed oil for the priming coat. On yellow pine, cypress, spruce and hemlock, use less linseed oil and more flatting oil.

(12) **Old Woodwork Inside**—Two coats of paint shall be used in repainting woodwork inside. For a flat finish, mix the paint for the first and second coats according to formula B in paragraph 11. For an eggshell gloss finish, mix the paint for the first coat according to formula B in paragraph 11 and according to formula D for the finishing coat.

(13) **Plaster Walls**—Three coats of paint shall be applied to plaster which has never been painted. The priming coat shall be Dutch Boy Wall Primer or the following:

Dutch Boy white lead (heavy paste)	100 lb.
Pure kettled-boiled linseed oil	7 gal.
Pure turpentine	1 gal.

Note: If boiled linseed oil can not be obtained, 7 gal. raw linseed oil with 3 pt. drier may be used instead, and will in most cases give satisfactory results. Boiled oil is much superior, however, and will obviate trouble when conditions are difficult. It seals pores in the plaster and prevents suction.

Mix the paint for the second coat according to formula B in paragraph 11 and according to formula C for the finishing coat if a flat finish is desired. If an eggshell finish is wanted, mix the paint for the finishing coat according to formula D.

In repainting plaster walls, follow the practice recommended for new plaster, except that the priming coat may be omitted.

(14) **Brick and Stucco**—Three coats of paint, mixed as follows, shall be applied to brick or stucco which has never before been painted:

	(a) Priming coat	(b) Second coat	(c) Third coat (gloss finish)	(d) Third coat (flat finish)
	Heavy Paste	Soft Paste	Heavy Paste	Soft Paste
Dutch Boy white lead	100 lb.	100 lb.	100 lb.	100 lb.
Pure linseed oil	7 gal.*	6¼ gal.*	4 gal.†	3¼ gal.‡
Pure turpentine	1 gal.	1 gal.	1 gal.	1 gal.
Pure drier	None	½ pt.	None	½ pt.
Dutch Boy white lead	100 lb.	100 lb.	100 lb.	100 lb.
Pure linseed oil	3½ gal.†	2¾ gal.‡	None	1 pt.‡
Dutch Boy flatting oil	None	None	2 gal.	None
Pure turpentine	1 pt.	1 pt.	None	2 gal.
Pure drier	None	½ pt.	None	½ pt.

*Boiled linseed oil is recommended but if it is not available use pure raw linseed oil and add pure drier not to exceed 1½ pints.

†Use ½ boiled and ½ raw linseed oil, or all raw oil. In latter case, add drier not to exceed 1¼ pints.

‡Raw.

Two coats of paint shall be applied in repainting brick and stucco. For the first coat, mix the paint according to formula B in paragraph 14 and for the finishing coat according to formula C or D.

(15) **Concrete and Stone**—Three coats of paint, mixed as follows, shall be applied to concrete and stone which have never before been painted:

	(a) Priming coat	(b) Second coat
	Heavy Paste	Soft Paste
Dutch Boy white lead	100 lb.	100 lb.
Pure linseed oil	5 gal.*	4¼ gal.*
Pure turpentine	1 gal.	¾ gal.
Pure drier	None	½ pt.

	(c) Third coat (gloss finish)	(d) Third coat (flat finish)
	Heavy Paste	Soft Paste
Dutch Boy white lead	100 lb.	100 lb.
Pure linseed oil	3½ gal.†	2¾ gal.‡
Dutch Boy flatting oil	None	None
Pure turpentine	1 pt.	1 pt.
Pure drier	None	½ pt.

*Boiled oil is recommended but if it is not available use pure raw linseed oil and add pure drier not to exceed 1½ pints.

†Use ½ boiled and ½ raw linseed oil, or all raw oil. In latter case, add drier not to exceed 1¼ pints.

‡Raw.

In repainting concrete and stone, apply two coats. Mix the paint for the first coat according to formula B in paragraph 15 and according to formula C or D for the second coat.

A semi-flat finish on brick, stone, concrete and stucco can be secured by applying over the second coat one or two coats of paint made with 100 lb. heavy paste white lead, 1½ to 2 gal. flatting oil and ¾ gal. spar varnish. For brick red finish on outside brick, thin the color with Dutch Boy flatting oil.

(16) **Metal Work, Exterior and Interior**—Three coats of paint, mixed as follows, shall be applied to exterior and interior metal work:

	(a) First coat	(b) Second coat
Dutch Boy red lead-in-oil	100 lb.	light brown
Raw linseed oil	2¾ gal.	100 lb.
Lampblack-in-oil	None	2¾ gal.
Pure turpentine	1 pt.	12 oz.
Pure drier	1 pt.	1 pt.
Pure dry red lead	100 lb.	or 100 lb.
Raw linseed oil	3¾ gal.	3½ gal.
Lampblack-in-oil	None	13 oz.
Pure turpentine	1 pt.	1 pt.
Pure drier	1 pt.	1 pt.
Dutch Boy red lead-in-oil		100 lb.
Raw linseed oil		3¾ gal.
Lampblack-in-oil		6 lb.
Pure turpentine		1 pt.
Pure drier		1 pt.
Pure dry red lead		or 100 lb.
Raw linseed oil		5 gal.
Lampblack-in-oil		6½ lb.
Pure turpentine		1 pt.
Pure drier		1 pt.

Note: If genuine boiled linseed oil is available, use one-third boiled and two-thirds raw oil, omitting drier.

If liquid red lead is to be used, specify Dutch Boy liquid red lead No. 1 (natural red lead color) for first coat, Dutch Boy liquid red lead No. 6 (light brown) for second coat and Dutch Boy liquid red lead No. 7 (dark brown) for third coat.

Where a dark color other than brown is desired for the finishing coat, one of the following formulas shall be used according to the color desired:

	Light green	Dark green
Dutch Boy red lead-in-oil	100 lb.	100 lb.
Raw linseed oil	5½ gal.	4 gal.
Medium chrome yellow	30 lb.	12½ lb.
Chinese or prussian blue	12 lb.	7½ lb.
Pure turpentine	1 pt.	2 pt.
Pure drier	1 pt.	2 pt.
Dutch Boy red lead-in-oil		Black
Raw linseed oil		100 lb.
Chinese or prussian blue		14 gal.
Lampblack-in-oil		16 lb.
Pure turpentine		52 lb.
Pure drier		½ gal.

If liquid red lead is to be used, specify Dutch Boy liquid red lead according to the finishing color desired, that is: No. 8—light green; No. 9—dark green or No. 5—black.

Printed Specifications Furnished

To any architect who desires, we will supply printed specifications in booklet form containing full and complete directions for the proper use of white lead in the painting of woodwork, plaster, brick, stone, concrete and stucco, and of red lead in the painting of metal.

Write our nearest branch office for "Standard Specification for the use of White Lead" or "Standard Specification for use of Red Lead."

The Color Range of Pittsburgh Proof Products

The colors shown below match as nearly as possible the colors of the paint when dry. Color chips, when kept from the light, as when closed up in a book, slightly change their color, the change being more marked in some shades than in others. When color chips are exposed to the light, and the applied paint is allowed to dry, the paint and the sample will match. Color cards showing complete range of colors supplied on request.

COMBINED DESCRIPTIVE DATA WITH SPECIFICATIONS

General

(a) Unless otherwise specified, the contractor or painter shall furnish all materials, provide labor, transportation, scaffolding and all other essential equipment and shall assume all liability of every character whatsoever in connection with the work.

(b) Care shall be taken that surface to be finished is thoroughly dry before applying any coating whatever.

(c) No ochre shall be used for priming.

(d) All finger marks, dirt, grease or other objectionable matter shall be carefully removed by the painter before commencing to fill, varnish or paint.

(e) The work shall be carried on continuously except for delays due to unfavorable weather and the time allowed for proper drying between coats.

(f) In painting new work, all knots and sappy places shall be coated with shellac before priming, care being taken to cover completely without spreading over more of the surrounding surface than is necessary.

(g) In painting new work, all cracks and nailholes shall be filled with putty after the priming coat.

(h) On a varnish job, putty shall match the wood after the coat of filler is applied.

(i) No painting or varnishing of outside work will be allowed in wet or freezing weather, nor inside work except where the building can be properly heated to at least 65° F.

(j) On old paint, the surface shall be first brushed with a wire brush and where it is scaling badly shall be scraped or burned off.

(k) All paint is to be well brushed out, and all paint, enamel, varnish, stain, and filler to be applied in a workmanlike manner, and as furnished by the manufacturer, without any thinning or addition whatever, except as noted on direction label, care to be taken to keep paint properly stirred.

(l) All materials shall be brought on the job in manufacturer's original package. Paints and enamel shall be thoroughly stirred before, and kept at a uniform consistency during application.

EXTERIOR PAINTING

Wood

"SUN-PROOF LIQUID PAINT" is the embodiment of "Save the Surface and You Save All." Made from pure carbonate of white lead, oxide of zinc, silica and coloring matter, Sun-Proof Paint contains the maximum quantity of strictly pure linseed oil to assure a tough, durable wear resisting paint film—a paint that can be spread uniformly and a paint suitable for all general purposes.

Specification No. 1

All exterior woodwork (except as otherwise specified) shall be painted with 3 coats of "Sun-Proof Liquid Paint" or "Snolite", color selected by the architect and applied as per directions on the can. Should a high gloss be desired, such as for portico of colonial residence, sand the finish and apply Banzai Enamel as the fourth coat.

Specification No. 2

Resinous woods such as cypress and cedar, as well as surfaces subject to spotting or peeling shall be primed with a mixture of "Pitcairn Tector" as indicated on directions.

Finish with "Sun-Proof Liquid Paint" or "Snolite."

"SNOLITE" is a semi-paste paint but so heavy that it requires thinning and manipulation by the master painter.

When thinned for painting, Snolite has fully one-half greater opacity than paints now considered standard. Produces a paint which is incomparably superior for spray painting because it can be applied thin.

Snolite dries with a smooth glossy surface of superior whiteness which does not discolor from hydrogen sulphide fumes prevalent around gas works or industrial areas.

"TOR-ON SHINGLE STAIN" is a highly preservative combination of Linseed Oil and Creosote combined in an assortment

of attractive new colors. Exceptional penetrating power makes it an ideal oil stain for outside surfaces.

Specification No. 3

Shingled roof, etc. to receive two coats of "Tor-On Shingle Stain", applied in accordance with directions.

"FLORHIDE ENAMEL" imparts a tough hide-like gloss that is unexcelled on either outside or inside floors. It is made to be walked upon.

Specification No. 4

Porch floors, decks, etc., shall receive two coats of Florhide Enamel applied in accordance with directions, allowing ample drying time between applications.

Metallic

"IRONHIDE STEEL PROTECTIVE PAINT" is made in two forms (Inhibitive Red for priming and Finishing Black.) Both come ready for use, either inside or outside, and are suitable for structural steel, bridges, gas holders, smokestacks, iron or steel wire or light poles, tank cars, air drafts, fire hydrants, etc.

Specification No. 5

After removing all traces of rust or grease, apply priming coat of Inhibitive Red Ironhide. Second coat shall be a mixture of the Red and Finishing material. Third coat shall be Ironhide Finishing Black.

Specification No. 6

Galvanized iron surfaces unless given time to weather shall be washed down with Ascectic Acid or Vinegar. Prime over the powdery deposit with "Pitcairn Tector" reduced according to directions. Second coat shall be Inhibitive Red Ironhide; finishing coat shall be Finishing Black Ironhide.

Stone

"CEMENTHIDE" is a flat drying liquid paint for painting cement, concrete, stucco, brick, stone or plaster; both interior and exterior. "Cementhide", used in connection with "Cementhide Priming Liquid" acts as a filler and waterproofing agent, as well as producing decorative effects. Cementhide dries hard and does not have a tendency to soften under water like ordinary paint. It is also affected to a much less extent by steam and alkaline vapors.

Specification No. 7

Stucco surfaces shall receive one coat of "Cementhide Priming Liquid" followed by two coats of "Cementhide", color to be selected by the architect.

INTERIOR PAINTING**VELUMINA WALLHIDE FIRST COATER**

THE application of paint on interior plaster surfaces has become increasingly difficult owing to inferior plaster work and the tendency to rush painting on wet or damp walls. These conditions offer a special handicap for all oil base flat wall paints. Practically every architect will agree that the use of varnish sealing coats is not the proper procedure for plaster walls. While the uneven suction effects on bad walls may be generally counteracted by using a varnish priming coat, the possibility of blistering and peeling of later paint coatings is very great. While a better looking job may be temporarily secured on wet or non-uniform plaster through the use of varnish base products, serious failures at a later date are always in prospect.

The Pittsburgh Plate Glass Company has always maintained the correctness of the principle of oil base flat wall paints and oil base primers; at the same time realizing that oil in its regular condition does not always meet the present type of surface and assure satisfactory two coat work.

With this thought in mind, development work has been carried on over a long period of time and has resulted in VELUMINA WALLHIDE FIRST COATER—a product which meets every requirement as a first coat material on plaster walls, giving the advantages of both an oil base and a varnish base paint without any of the disadvantages, and at the same time giving added properties possessed by neither.

VELUMINA WALLHIDE FINISHING FLAT

Velumina Wallhide Finishing Flat is manufactured with the same base liquid as Velumina Wallhide First Coater, and possesses all the unique properties of that product, although these are naturally modified somewhat on account of the higher pigment content. No product heretofore offered has had the unusual properties enjoyed in Wallhide Finishing Flat, and it is only necessary for the master painter to try the product under unusual conditions to immediately convince himself of this fact. It will demonstrate itself most effectively where everything else has failed.

It possesses unusual characteristics, the most outstanding of which are as follows:

- (1) Over Wallhide First Coater, Finishing Flat assures a perfect two-coat job on any kind of plaster surface.
- (2) The permanency of the work is guaranteed by its elasticity and high resistance to moisture and alkali.

- (3) It has excellent hiding, both because of its opacity and perfect flowing.
- (4) It has great economy because it spreads easily and further than most products.
- (5) For rush work, it may be applied over Wallhide First Coater within two hours after the application of the former and give a perfectly uniform finish.
- (6) It gives remarkable results as a one-coat refinishing paint because:
 - a. Its opacity and perfect flowing give excellent hiding.
 - b. Its ability to cover imperfections in the old finish results in a surface uniform in color and sheen, and free from suction spots.
- (7) Whenever the occasion demands, it may be recoated within four hours after application.

Plaster**"VELUMINA FLAT WALL PAINT"**

covers the walls with a tough, velvet-like film at once durable, washable and sanitary. An Interior decorated with "Velumina" adds refinement and distinction to the surroundings. Its pigments are smooth in texture, possessing extreme opacity or hiding properties and the liquids used are free from varnish or resinous substances. Having an oil base, it works easily, leaving no brushmarks or laps.

Specification No. 8**Plain Flat
or Stippled
Finish**

Wash or scrape off all calcimine, loose paint, dirt, grease, etc. Fill cracks with a putty made from Velumina stiffened with whiting. No painting shall be done until plaster is reasonably dry. One Coat of VELUMINA WALLHIDE FIRST COATER applied according to directions. Dry over night and follow with One Coat of VELUMINA WALLHIDE FINISHING FLAT.

While VELUMINA WALLHIDE FINISHING FLAT gives best results, (as do all other products) when used over Wallhide First Coater, it is also suitable for use over any other type of undercoater, assuring superior results to those obtainable with other products.

Where three coat work is specified the Wallhide system is extended as follows:

First Coat—Velumina Wallhide First Coater.

Second Coat—Mix equal volumes First Coater and Wallhide Finishing Flat.

Third Coat—Velumina Wallhide Finishing Flat, or mixture of Flat and First Coater to increase sheen.

Optional Specification

Prime with one coat of "Velumina Wallhide Firstcoater" after thinning in accordance with directions on the container. Follow with two coats "Velumina Flat Wall Paint." The final coat may be stippled after thirty minutes if such finish is desired.

Note: Because of its hiding qualities and extraordinary resistance to suction and alkali spots, "Velumina Wallhide Firstcoater" will frequently obviate the necessity of a third coat of Velumina.

Specification No. 9

*Semi-Gloss
or
Gloss Finish*

As first coat apply Velumina Wallhide Firstcoater, tinting it to approximate finish color. For semi-gloss the second and third coats (if a third coat is needed) shall be Sun-Glo Finish. For a high gloss the second coat should consist of "Banzai Double Cover Undercoater" thinned 25% with linseed oil. The third coat shall be "Banzai Gloss Enamel". A subdued gloss may be obtained by lightly rubbing the finish coat with pumice and water.

Specification No. 10

*Textured
Finish*

Surface to be treated shall be primed with "Velumina Wallhide Firstcoater." Plastic Velumina may be applied with a plasterer's trowel and textured to give any desired effect. Ten different treatments are illustrated and complete directions given in an attractive portfolio which will be sent architects on request.

Specification No. 11

Metallic

*Interior
Metal Surfaces*

Radiators, pipes, wrought iron, etc. shall be primed with "Pitcairn Tector" reduced with one quart of Leptyne or Turpentine to the gallon. It is recommended that radiators be finished with "Velumina Flat Wall Paint." The finish on other objects depend upon surroundings. "Waterspar Flat Black" imparts a pleasing dull enamel surface to wrought iron stair-railings, etc.

(Send for Book—Velumina Wallhide and its Application.)

Pitcairn Aged Finishing Spar for Finest Interiors

Rich and lasting. Use on new or old work, whether full gloss, rubbed dull or polished. It is unexcelled in brilliance, body, working qualities and durability. Insures style and individuality to the work. Dries dust free in 8 to 10 hours, hardens in 2 days and may be rubbed the third day.

One gallon covers 550 to 600 sq. ft.

Pitcairn Aged Floor Spar for Finest Floor Finishing

Withstands severest wear. Use on new or old work. It has wonderfully free, easy working qualities, extraordinary permanence, toughness, brilliance and elasticity. Dries dust free in 6 to 8 hours and hardens in 24 hours.

One gallon covers 550 to 600 sq. ft.

Pitcairn Aged Flat Finish for Artistic Interior Work

Produces a rich, silky dull rubbed effect. Use for mission finish and in place of hand rubbing. This varnish dries with an even flat finish that has the appearance of being rubbed. Has the body

of gloss varnish, protects perfectly the surface to which it is applied, and may be used on either new or old work. One coat is sufficient to produce a dull rubbed effect on old work or over an undercoater of gloss varnish for new work. Two coats applied to new wood over filler will produce a silky, soft mission effect. Works nicely under the brush; flows out well. Dries dust free in 2 hours and hardens in 24 hours. Contains no paraffin or beeswax and may be coated with a gloss varnish, or as many coats may be applied as are necessary.

One gallon covers 650 to 700 sq. ft.

Pitcairn Tector (the Right Foundation)

Pitcairn Tector practically provides one undercoater for all purposes, interior and exterior.

Tector has a greater range of usefulness than any other undercoater. It may be used as an undercoater on any surface, interior or exterior—wood, metal, cement, plaster, burlap, canvas; and under oil paints, enamels, varnishes, flat wall paint, calcimine and floor wax.

Pitcairn Tector is a discovery of far reaching importance, imparting durability under conditions where finishing materials have never been durable before, and greatly multiplying durability of paints, enamels, stains and varnishes under all circumstances.

Note: A book of Tector specifications, demonstration panels, and test tins will be furnished on request.

Pitcairn Wood Stains

Excel in penetrating qualities, clearness and richness. Used on all kinds of wood, whether soft, spongy or the hardest close grain.

They produce beautiful, deep, rich soft visual effects. They bring out the high lights and beauty of wood without obscuring the grain or causing cloudiness. They lend tone and impart an air of refinement to the surroundings. They do not raise the grain of wood nor affect thin veneers, being free from water, acid or alcohol. They may be mixed with the filler for tinting, or be reduced with turpentine or benzine. They set slowly, thus admitting of the surplus being removed from the surface with a cloth or sponge without showing cloudiness or laps. The work may be finished with wax or varnish as desired.

There are 14 beautiful colors in imitation of all popular woods and shades.

One gallon covers from 800 to 1000 sq. ft.

Note: Stain set, consisting of 20 wood panels, mounted on cloth, showing the color of Pitcairn Wood Stains on various kinds of wood, will be sent to all architects and their clients or to painters on request.

Pitcairn Banzai Enamel for All White Work

Rich and permanent. Used for all white work whether natural gloss, rubbed dull, polished or flat enamel finish. It is marvelously tough and elastic, approximately 50% more durable than ordinary enamels. Will not chip or crack, is stable in color and retains its immaculate, grainless surface regardless of frequency of washing or method of house heating.

The free flowing qualities of Banzai Enamel enable the work to be accomplished about 25% faster than with ordinary enamels.

Its splendid hiding qualities in many instances save the cost of work and time of an extra coat. Its great covering capacity and labor saving characteristics make it more economical to use than the cheaper ordinary enamels—not to consider its greater durability. Banzai Enamel furnishes a safety factor for the architect who demands flawless work, gives the decorator protection against blemishes, and reduces the labor costs; while the building owner gets a far greater durability than with the use of ordinary enamels. Dries dust free in 6 hours, and hardens in 48 hours.

One gallon covers approximately 500 sq. ft.

Note: Portfolio showing reproductions of 30 modern white enamel interiors will be sent to architects or their clients, on request.

Banzai Double Cover Undercoater

Banzai Double Cover Undercoater will cover as many square feet of surface as lead, zinc, or lithopone undercoaters and do the work from 50% to 100% better. Banzai Double Cover Undercoater is intensely white and possesses greater opacity than any other paint material. It spreads easily under the brush without pulling and flows out so smoothly as to require little or no sanding. The pigment used is inert and non-poisonous.

Distinctive Varnish Finishes

The Pitcairn label and trade-mark guarantee *quality as represented* and insure the economical securing of results that will be most satisfactory.

Pitcairn Aged Mast Spar for Exposed Work

Possesses the maximum of durability obtainable in exterior finishing varnish. Use on all surfaces subjected to severest exposures, whether marine finishing, outside doors, window casings, signs, etc., on new or old work. It has great elasticity and wear resisting qualities. Will not scratch or mar white, dries dust free in 10 to 12 hours and hardens in 48 hours.

One gallon covers 550 to 600 sq. ft.

Specification No. 12

OAK AND ASH

Varnish Finish—Four-coat Work—Standing Trim

All oak or ash wood (locations designated) shall receive a coat of natural paste wood filler, properly reduced with Leptyne, turpentine or benzine, and brushed well into the grain. (Excess of filler must be carefully and neatly cleaned from the surface by rubbing across the grain.)

Care must be taken that all grooves and corners are well cleaned with a hardwood stick. Fill all nailholes with putty tinted to match the wood.

The surface shall then receive a coat of Pitcairn Tector, reduced with Leptyne or turpentine, $\frac{1}{2}$ gal. to the gallon. After 24 hours, sandpaper carefully. Then apply 2 coats of Pitcairn Aged Finishing Spar Varnish, allowing at least 48 hours between coats for drying. Sand lightly between varnish coats with No. 0 paper.

For an extra fine job, apply a third coat of Pitcairn Aged Finishing Spar Varnish.

For dull finish, rub the last coat with fine pumicestone and rubbing oil. For dull finish without the expense of rubbing, substitute Pitcairn Aged Flat Finish for the last varnish coat.

Apply flat varnish freely with a badger-hair or black fitch flowing brush.

Specification No. 13

BIRCH AND MAPLE

Varnish Finish—Three-coat Work—Standing Trim

All birch or maple wood (locations designated) shall receive a coat of Pitcairn Tector reduced with Leptyne or turpentine, gallon for gallon. After 24 hours, sandpaper carefully. Fill all nailholes with putty tinted to match the wood. Apply 2 coats of Pitcairn Aged Finishing Spar Varnish, allowing at least 48 hours drying between coats. Sand lightly between coats.

If an extra fine job is desired, apply a third coat of Pitcairn Aged Finishing Spar Varnish.

If dull rubbed finish is desired, rub the last varnish coat. If a dull finish is desired without expense of rubbing, substitute Pitcairn Aged Flat Finish for the last varnish coat.

Apply flat varnish freely with a badger-hair or black fitch flowing brush.

Specification No. 14

GUM, PINE, FIR AND REDWOOD

Varnish Finish—Three-coat Work—Standing Trim

All gumwood, pine, fir or redwood (locations designated) shall receive 1 coat of Pitcairn Tector reduced with Leptyne or turpentine $\frac{1}{2}$ gal. to the gallon. After 24 hours sandpaper carefully. Fill all nailholes with putty tinted to match the wood. Apply 2 coats of Pitcairn Aged Finishing Spar Varnish, allowing at least 48 hours' drying between coats. Sand lightly between coats.

If an extra fine job is desired, apply a third coat of Pitcairn Aged Finishing Spar Varnish.

If desired, the last coat may be rubbed to a dull finish with fine pumicestone and rubbing oil. If a dull finish is desired without the expense of rubbing, substitute Pitcairn Aged Flat Finish for the last varnish coat.

Apply flat varnish freely with a badger-hair or black fitch flowing brush.

Specification No. 15

GENUINE MAHOGANY

Varnish Finish—Four-coat Work—Standing Trim

All mahogany wood (locations designated) shall receive 1 coat of mahogany paste wood filler, properly reduced with Leptyne, turpentine or benzine, and brushed well into the grain. (The excess of filler must be carefully and neatly cleaned from the surface by rubbing across the grain.) Care must be taken that all grooves and corners are well cleaned with a hardwood stick. Fill all nailholes with putty tinted to match the finish.

The surface shall then receive 1 coat of Pitcairn Tector reduced with Leptyne or turpentine, $\frac{1}{2}$ gal. to the gallon. After 24 hours, sand carefully.

Sand lightly between coats with No. 0 paper.

If an extra fine job is desired, apply a third coat of Pitcairn Aged Finishing Spar Varnish.

For dull finish, rub the last coat with fine pumicestone and rubbing oil. If a dull finish is desired without the expense of rubbing, substitute Pitcairn Aged Flat Varnish for the last Varnish coat.

Apply flat varnish freely with a badger-hair or black fitch flowing brush.

Stained Wood Finishes

Note: Soft, porous woods absorb stain more readily than hard, close grained pieces. Painters will use care and judgment to get uniform effects. When necessary, reduce stain with Leptyne, turpentine or naphtha.

Specification No. 16

OAK WOOD

Four-coat Work—Standing Trim

All oak wood (locations designated) shall receive a coat of color designated, the excess being removed with a cloth after sufficient time has elapsed for penetration. Fill all nailholes with putty tinted to match the finish. After 12 hours a thin coat of Pitcairn Spirit Lacquer or pure gum shellac shall be applied. Apply 2 coats of Pitcairn Aged Flat Finish, flowed on with a badger-hair or black fitch flowing brush to insure a smooth dull finish. Allow at least 24 hours between coats for drying.

Apply only enough lacquer or shellac to seal the stain. Avoid a heavy coating.

Specification No. 17

ALL SOFT WOODS

Varnish Finish

All soft wood (locations designated) shall receive a coat of color designated, the excess being removed with a cloth after sufficient time has elapsed for penetration. Fill all nailholes with putty tinted to match the finish. After 12 hours, a thin coat of Pitcairn Spirit Lacquer or pure gum shellac shall be applied. Apply 2 coats of Pitcairn Aged Finishing Spar Varnish, allowing at least 48 hours between coats for drying. Sand lightly between varnish coats with No. 0 paper.

If an extra fine job is desired, apply a third coat of Pitcairn Aged Finishing Spar Varnish.

If desired, the last coat may be rubbed to a dull finish with fine pumicestone and rubbing oil. If a dull finish is desired without the expense of rubbing, substitute Pitcairn Aged Flat Finish for the last varnish coat.

Apply flat varnish freely with a badger-hair or black fitch flowing brush. Apply only enough spirit varnish to seal the stain. Avoid a heavy coating.

White Enamel Finishes—Banzai System

Specification No. 18

OAK AND ASH WOODS

High Gloss Enamel Finish—Five-coat Work

All oak and ash woods (locations designated) shall receive a coat of natural wood paste filler, properly reduced with Leptyne, turpentine or benzine, brushed well into the grain. (The excess of filler must be carefully and neatly cleaned from the surface by

rubbing across the grain.) Care must be taken that all grooves and corners are well cleaned with a hardwood stick. Fill all nailholes with putty. Then apply 2 coats of Banzai Double Cover Undercoater as it comes in the can, allowing 24 hours between coats. Sand the last coat to a smooth surface.

For the next coat use a mixture of 2 parts of Banzai Enamel and 1 part Banzai Double Cover Undercoater. Sand lightly after allowing 48 hours for this coat to dry.

The last coat shall be flowed on freely—using Banzai Enamel as it comes in the can.

If an extra fine finish is desired, rub the enamel coat and flow on another coat of Banzai Enamel.

Specification No. 19

BIRCH, MAPLE, CYPRESS, GUM, WHITEWOOD, REDWOOD AND POPLAR WOOD—METAL AND PLASTER

High Gloss Enamel Finish—Five-coat Work—

All birch, maple, cypress, gum, whitewood, redwood and poplar wood, and metal and plastered surfaces (locations designated) shall receive 1 coat of Pitcairn Tector, reduced according to directions on the can, with Leptyne, turpentine or benzine. If desired, covering will be improved by use of a priming mixture of 1 gal. Pitcairn Tector reduced with 1 gal. Banzai Double Cover Undercoater and ½ gal. boiled linseed oil. After 24 hours, sandpaper carefully. Fill all nailholes with putty.

Then apply 2 coats of Banzai Double Cover Undercoater as it comes in the can, allowing 24 hours between coats. Sand between coats to a smooth surface.

For the next coat use a mixture of 2 parts of Banzai Enamel and 1 part Banzai Double Cover Undercoater. Sand lightly after allowing 48 hours for this coat to dry. The last coat shall be flowed on freely, using Banzai Enamel as it comes in the can.

If an extra fine finish is desired, rub the last enamel coat and flow on another coat of Banzai Enamel.

LAVAX ARCHITECTURAL FINISH

LAVAX is the name that has been adopted to designate a new type of finishing material having extremely novel properties. It combines the chief advantages of lacquer and varnish, and yet is distinct from either.

LAVAX contains ingredients which as a general class are common to varnish, but certain of these are entirely new and different from any material formerly used in varnish manufacture. These new materials impart certain distinct properties to the finished product which have not heretofore been characteristic of varnish.

LAVAX Architectural Finish possesses the following distinct advantages.

Rapid Drying Schedule—

The drying time of LAVAX Architectural Finish allows a finishing schedule approaching a pyroxylin lacquer system. For example, two coats of LAVAX Clear Interior may be applied in one day.

Ease of Application—

LAVAX possesses an ease of brushing superior to all lacquers and equal to the most freely flowing varnish.

THE GEO. W. REINHARDT CO., INC.

Manufacturers and Distributors of Titanium Stock White

GENERAL OFFICES AND WORKS
SOUTH BOSTON, MASS.

For All Surfaces

Clevo Titanox stock may be advantageously used to protect and beautify exterior or interior surfaces of wood, metal, masonry, plaster, gypsum, etc.

Clevo paint or enamel ages slowly and retains a clear, clean, durable finish. On exterior surfaces Clevo Titanox will chalk just enough to present a perfect base when repainting time arrives.

"Cleaves to the Surface"
TRADE-MARK

Covering Capacity and Durability

Clevo Titanox is used, tinted and applied in the same manner as white lead. It has, however, better hiding properties, absorbs more linseed oil, and also stays white longer. 120 lb. of Clevo equals 200 lb. of white lead in covering capacity.

The extra linseed oil content of Clevo Titanox insures great durability and lessens the labor cost of applying.

Labor Economy

Brush painting contracts are approximately 22% stock and 78% labor. Clevo Titanox saves one man's time in five or approximately 20% of the larger item of painting expense.

References

The American Society for Testing Materials, R. L. Hallett, Vol. 22, Part 2, 1922, shows the hiding power of Titanox over lead as 100%. This is of tremendous importance for obtaining better painting at less expense.

Specification Data

All surfaces must be clean, dry, and properly prepared to receive paint. Clevo Titanox may be applied with brush or spray. Linseed oil, turpentine, varnish, dryers, and colors shall be of first quality and approved by the architect.

Exterior Painting

Wood Surfaces, 3 Coats

Primer	Undercoat

Clevo Bonding Protects Architect and Owner

To architects and owners we furnish, without obligation, names and addresses of reliable painters and decorators in any part of the United States and Canada.

A bond for the amount of the paint contract is

offered without charge on any bonding company selected by the architect, guaranteeing Clevo against fading, checking, cracking or blistering, provided it is applied by professional painters who are of good repute and who have been established not less than five years.

FOREWORD TO SPECIFICATIONS

The following specifications, unless otherwise stipulated, are intended to cover the entire field of finishing walls, floors and woodwork. They are in reality three sets of specifications, covering as they do the usual paint, varnish, stain, or enamel finish, as well as Opex Architectural Lacquer finish, either spray or brush application.

Before using the specifications it is necessary to refer to the index, which will be found to be cross-referenced, wherever either paint or varnish, or lacquer might be possible. For additional information, address THE SHERWIN-WILLIAMS Co., Department of Architectural Service, 101 Prospect Avenue, N. W., Cleveland, Ohio, or any of the branch offices listed on the preceding page.

METAL PROTECTIVE COATINGS

*Specification No. 1***Exterior Exposure**

Discussion—In the following specification, which applies to buried or exposed steel alike, Sherwin-Williams Kromik Metal Primer and Sherwin-Williams Metalastic are called for. Kromik Metal Primer is specified because of its particular suitability for use as a protective coating to be applied directly to metal. Metalastic is specified on account of its particular suitability as a final protective coating which will staunchly guard against danger to the undercoats.

In the manufacture of Sherwin-Williams Kromik Metal Primer, chromates play a highly important part. Authorities are agreed that the use of chromates is a very wise procedure in a metal protective primer intended to be applied direct to the metal surface for the prevention of rust. In tests extending over a period of five years or more, all paints containing chromates have made a uniformly excellent showing. Chemists explain the function of chromates as having the tendency to render the surface of steel passive, or in other words, chromates reduce the tendency of the metal surface to set up galvanic action or electric currents within itself. An interesting application of this principle is found in the use of ferro chromes in the manufacture of so-called stainless steel cutlery. Another interesting test is the well-known Sherwin-Williams razor blade test in which the razor blade—submerged in water carrying a certain percentage of chromates—remains bright a year after the razor blade submerged in untreated water has been reduced to rust.

Kromik Metal Primer has the following advantages for use on structural steel as compared with red lead, which is recognized as a standard material with many years standing for this type of work and which is a most excellent paint in itself: Kromik is noticeably easy to apply, especially in difficult and inaccessible members; it is not affected by sulphur compounds in the air and shows markedly greater durability where it lies unprotected on the job for any period of time. Kromik inhibits corrosion and shows a very favorable lower material cost. Kromik is Sherwin-Williams' standard recommendation for a priming coat on all metal work.

Sherwin-Williams Metalastic is our standard specification for finishing coats on structural steel work. It is specified for the second and third coats and is a protective coating of the graphite type. Metalastic is a full oil paint which dries to a tough, durable and exceedingly impervious film with high water shedding properties. It is particularly fitted for use over Kromik Metal Primer because these two products have the same degree of elasticity and expand and contract with the metal to the same degree. Where this relationship does not hold, there is a decided tendency in the finishing coat to break, thereby ending its usefulness as a metal protective coating.

Sherwin-Williams has no particular type of paint or pigment to exploit. We make a complete line of metal protective paints and our specification of Kromik Metal Primer with Metalastic for finishing coats has been recommended as standard because we believe it embodies the best painting practice considered from every side of the question.

Specification—Before applying the priming coat or shop coat, all rust, mill scale, grease or foreign matter of any kind shall be completely removed from the surface to be painted. No painting shall be done in wet or freezing weather, nor shall paint be applied to any wet or damp surface. Paint shall be used in the consistency received from the manufacturer. No thinner shall be added without the written approval of the architect or engineer.

The priming or shop coat shall be applied before steel is shipped to site. All riveted and bolted connections, as well as parts inaccessible after erection, shall receive two coats of Kromik Metal Primer. The second coat (first field coat) shall consist of Sherwin-Williams Metalastic Brown. Any portions of the surface which have been abraded in transit shall be "spotted" with Kromik Metal Primer prior to the application of the second coat. When the second coat is dry, a full coat of Sherwin-Williams Metalastic, Black, shall be applied.

*Specification No. 2***Iron or Steel Surfaces Exposed to Acid Fumes**

Before applying the priming coat or shop coat, all rust, mill scale, grease or foreign matter of any kind shall be completely removed from the surface to be painted. No painting shall be done in wet or freezing weather, nor shall paint be applied to any wet or damp surface. Paint shall be used in the consistency received from the manufacturer. No thinner shall be added without the written approval of the architect or engineer.

A priming or shop coat of Sherwin-Williams Kromik Metal Primer shall be applied before steel is shipped to site. All riveted and bolted connections, as well as parts inaccessible after erection, shall receive two coats of Kromik Metal Primer. Any portions of the surface which have been abraded in transit shall be "spotted" with Kromik Metal Primer prior to the application of the second coat (first field coat). The second and third coats shall consist of Sherwin-Williams Non-Corrodible Acid Resisting Paint, Black.

*Specification No. 3***Hot Surfaces (Stacks, Flues, Pipes, etc.)**

Before applying paint, all rust, dirt and grease shall be thoroughly cleaned off the surface to be painted. Paint shall be applied as it comes from the package. The priming coat shall consist of Sherwin-Williams Salamander Black, which, when dry, shall be second coated with the same material.

*Specification No. 4***Exterior Ornamental Iron Work (Flat Black Finish)**

Before applying the priming coat, all rust, mill scale, grease and other foreign matter shall be completely removed from the surface to be painted. No painting shall be done in wet or freezing weather, nor shall paint be applied on wet or damp surfaces. The first two coats shall be applied in the consistency supplied by the manufacturer.

The priming or shop coat shall consist of Sherwin-Williams Kromik Metal Primer and shall be applied prior to shipment of metal to the site. The second coat shall consist of Sherwin-Williams Metalastic Black. Any portions of the surface which

METAL PROTECTIVE COATINGS (Continued)

have become abraded in transit shall be "spotted" with Kromik Metal Primer prior to the application of the Metalastic paint. The third coat shall consist of Sherwin-Williams Quick Drying Color Black, thinned with turpentine, and when thoroughly mixed, raw linseed oil shall be added. The mixture shall be in proportion of two parts of black by bulk to one part of turpentine and one part of linseed oil by bulk.

Specification No. 5**Verde Antique Finish on Exterior (or Interior) Metal Work**

Before applying any paint, all rust, grease, resin, dirt, etc., shall be removed from the surface of the metal. The priming coat shall consist of Sherwin-Williams Kromik Metal Primer, to be applied in the consistency supplied by the manufacturer.

The priming coat shall be applied prior to the shipment of the metal to the site. Any portions of the surface which have been abraded in transit, shall be "spotted" with Kromik Metal Primer prior to the application of the second coat. The second coat shall consist of SWP (Sherwin-Williams Prepared Paint) shade No. 393. The third coat shall consist of a brush-stipple coat of SWP No. 355, tinted with Sherwin-Williams First Quality Oil Color Paris Green, to the shade desired by the architect.

Specification No. 6**Painting of Galvanized Iron**

All galvanized iron surfaces to be painted, such as gutters, down-spouts, etc., shall receive a priming coat of Sherwin-Williams Galvanized Iron Primer prior to the application of any paint.

DAMP-PROOFING OF FOUNDATIONS**Specification No. 7**

Discussion—Sherwin-Williams Antydamp is applied to the exterior of concrete or masonry foundations below grade, to prevent the penetration of moisture through foundation walls, and thereby making dry basement walls possible. Antydamp is a damp-resisting, alkaliproof, acidproof, black paint of asphalt type. It is very heavy in body, and will remain in a semi-tacky and elastic condition indefinitely, thereby preventing the cracking of the film with the resultant penetration of dampness into the foundation walls.

Sherwin-Williams Antydamp will cover approximately 25 to 40 square feet, two coats to the gallon. It comes ready for application and is applied cold, except in very cold weather when it is necessary to heat slightly before applying.

Antydamp should be applied in full coats without endeavoring to brush the material out too much, because

the heavier the coating is, the more protection it affords. In applying Antydamp, it is recommended that a three or four-knot roofing brush be used.

Where there is a presence of hidden springs or marshy land, or hydrostatic pressure in any form around the foundation, the use of two coats of Antydamp is not sufficient. Under these conditions, it will be necessary to alternate at least two layers of cheap burlap or felt paper with Antydamp. Special instructions regarding procedure to be followed will be supplied upon request.

Specification—The exterior of all foundation walls below grade, prior to any backfilling, shall be dampproofed by the application of two full coats of Sherwin-Williams Antydamp Foundation Damp-Proofing in the consistency supplied by the manufacturer. Twenty-four hours shall be allowed for drying between the first and second coats, and at least 24 hours shall be permitted to elapse after the second coat has been applied, before backfilling. This dampproof material shall be applied with a three or four-knot roofing brush.

Note: Sufficient space shall be provided, in digging the excavations, for men to have room to apply Antydamp to all parts of the foundation surface.

WOOD PRESERVATIVE**Specification No. 8**

Discussion—Sherwin-Williams Carbolic-oil, specified as a wood preservative, is as strong, penetrating and permanent a wood preservative as can be produced. It is a non-volatile oil, obtained through coal-tar distillation, which may be applied to the wood either by

the brush or dip method and will remain permanently in the pores of the wood, thereby preserving it for the longest possible time.

Specification—All wood which is to be buried in the ground shall be treated with one coat of Sherwin-Williams Carbolic-oil, which shall be applied in the consistency supplied by the manufacturer.

PAINTING AND STAINING OF EXTERIOR SURFACES**Specification No. 9****Wood Surfaces (New) to Paint**

Discussion—SWP (Sherwin-Williams Prepared Paint) represents the best of technical knowledge in the production of paint for general outside use today. The architect may specify SWP for outside painting on wood buildings or for finishing coats on outside metal work where special colors are required not found in our Metalastic line and may have a definite feeling of assurance that SWP will present a better appearance and wear for a longer time than any paint possible to mix by hand. A man is not able to purchase raw materials and mix the paint himself that will equal SWP. Mechanical efficiency and handwork cannot be compared; the painter's facilities for measuring proportions of pigments accurately cannot be compared with factory equipment; hand stirring can never equal machine grinding; and the certainty of uniformity in the various ingredients is decidedly in favor of factory production.

Sherwin-Williams honestly believe that no finer paint can possibly be made for painting outside buildings than SWP.

SWP is made in 32 colors and white. It is a combination of strictly pure carbonate of lead, sulphate of lead, zinc oxide and a small amount of magnesium silicate. The liquids are strictly pure linseed oil and turpentine. SWP is a *perfectly balanced* paint from the standpoint of scientific paint manufacture and will render the greatest satisfaction from the standpoint of beauty, economy and years of service.

For Color Samples, see S-W Pages 5 and 7.

(Note Specification No. 10.)

Specification—Before commencing work on exterior painting, the contractor shall make sure by careful inspection that the surface to be painted is thoroughly dry and shall continue this vigilance throughout the time during which the exterior painting is being done, so that no painting shall be done under unfavorable conditions, such as immediately after a rain or during wet or frosty weather.

Different kinds of lumber, however, require different treatment, and we have, therefore, suggested special treatment for certain kinds as mentioned. The greatest care should be taken in following the directions.

Where the wood shows pitchy spots, these spots and all knots should first be coated with the best orange shellac after the priming coat is applied.

(See also S-W Page 7)

Please do not detach color samples. Complete color cards sent upon request.

PAINTING AND STAINING OF EXTERIOR SURFACES (Continued)

New Wood (Outside)—First Coat—On new soft wood or old weathered lumber a gallon of SWP should be thinned with one gallon raw linseed oil and one quart pure turpentine.

For resinous woods, such as yellow pine or cypress, add two quarts turpentine and one quart raw linseed oil to each gallon of paint.

After the priming coat has been permitted to dry, all nail-holes, cracks, and other defects shall be filled in with linseed oil and whiting putty.

Second Coat—For soft woods add one pint pure turpentine.

Third Coat—Apply SWP as it comes from the can. If thinning seems necessary, thin slightly, using pure raw linseed oil.

Repainting Work (Outside)—Same as above, except omit first or priming coat.

Specification No. 10

(Alternative to Specification No. 9)

Wood Surfaces (New) to Paint

Discussion—Where the architect desires to leave the mixing of the paint for use on exterior wood surfaces to the discretion of his painting contractor, the specification of Sherwin-Williams Zilo is advised in preference to straight white lead. It is a generally recognized fact that a definite percentage of zinc oxide added to a white lead paint is greatly beneficial to the paint. It tends to eliminate objectionable chalking, thereby lengthening the life of the paint; it increases its whiteness and improves the gloss and spreading power of the paint.

The U. S. Government and the majority of State Governments and railways insist upon a percentage of zinc oxide in paints specified for the painting of exterior surfaces because of the fact that white lead, when used alone, shows a marked tendency to objectionable chalking and necessitates repainting at a much earlier date than paints which include a proportion of zinc oxide.

Zilo is a 100% pure product and every pound is guaranteed pure. Zilo is offered not as a lead substitute, but as superior to white lead, when used alone.

THE SHERWIN-WILLIAMS Co. will be very glad to provide specifications on the amount of linseed oil, turpentine and drier for any purpose desired upon request.

Specification No. 11

White Lead

In all specifications requiring the specification of white lead when used alone, specify Sherwin-Williams ODP White Lead, which is a strictly pure white lead (lead carbonate), and ground in strictly pure linseed oil. ODP Lead is extremely fine and very white. Each keg of the material bears the following strong guarantee of quality:

"This package is warranted to contain nothing but Strictly Pure White Lead, ground in Strictly Pure Linseed Oil, and we will pay one ounce of gold for every ounce of adulteration that it may be found to contain."

Specification No. 12

Exterior Wood Surfaces (Old) to Paint

Discussion—The following specification deals with the refinishing of previously painted exterior wood surfaces. One of the main features which the architect should watch is that, before applying the first coat of paint, all loose paint is removed from the surface by wire-brushing, scraping, or burning, that the surface is thoroughly dry, and that all knots and pitchy places which are evident through the old film are properly

sealed with pure Orange Shellac. The advisability of using SWP (Sherwin-Williams Paint) is discussed under Specification No. 9.

See Color Samples on S-W Pages 5 and 7.

Specification—Before commencing the painting of exterior surfaces, the contractor shall make sure, through careful inspection, that the surface to be painted is thoroughly dry and in proper condition for refinishing, and shall continue his vigilance throughout the time during which the exterior painting is being done. The first coat shall consist of SWP (Sherwin-Williams Paint) thinned with one pint of pure raw linseed oil and one pint of turpentine added to each gallon. After sufficient time has been allowed for drying, a second coat consisting of SWP, thinned with one pint of raw linseed oil to the gallon, shall be applied.

Specification No. 13

Wood Surfaces (New) to Stain

(For Staining Shingles, see Specification No. 15.)

Discussion—Where the architect desires to stain and preserve exterior wood surfaces without hiding the grain of the wood, Sherwin-Williams Preservative Shingle Stain, described in Discussion under Specification No. 15, is recommended for the purpose.

The stain is made of light-fast colors and a wood preservative of which refined creosote oil is an important ingredient.

Specification—The exterior woodwork indicated shall be finished with two brush coats of Sherwin-Williams Preservative Shingle Stain, which shall be applied in the consistency supplied by the manufacturer.

Specification No. 14

Concrete, Cement or Stucco Walls to Paint

Discussion—The architect appreciates the advisability of painting exterior concrete or stucco walls. This is advisable for two reasons: first, the control of the decorative effect in color, as required by the type of building, which paint affords, and the ease in which the building can be cleaned up in appearance and the change of color scheme effected. Second, painting a concrete wall renders it watertight and prevents the appearance of hair line cracks and chipping off caused by the penetration of moisture and frost.

Sherwin-Williams Stucco and Concrete Paint is an oil paint designed for outside exposure, but which dries to a velvety finish without objectionable gloss. It does not destroy the interesting texture of the stucco wall as does a gloss finish, but retains the effect for which stucco is specified.

Specification—All exterior concrete wall surfaces shall receive two coats of Sherwin-Williams Stucco and Concrete Paint in the color selected by the architect. Before proceeding with the painting, the painting contractor shall make sure through careful inspection that the surface to be painted is thoroughly dry and free from dirt.

Any salts or efflorescence on the surface to be finished, shall be carefully scraped off and the surface washed with a solution of zinc sulphate (1½ to 2 pounds to the gallon of water). Let dry thoroughly.

The first coat shall be thinned with pure turpentine in proportion of one quart of turpentine to the gallon of paint. At least 48 hours shall be allowed for the first coat to dry, after which the second coat, thinned with one pint to one quart of raw linseed oil, shall be applied. This produces a slight sheen. If objectionable, apply just as it comes from the package.

Specification No. 15

Wooden Shingles (New) to Stain

Discussion—Sherwin-Williams Preservative Shingle Stains are called "preservative" because they contain creosote, a well-known preservative of all vegetable

SWP**SHERWIN-WILLIAMS PAINT PREPARED**

	Tobacco Brown 393	Suitable Trimmers 375 385 387		Cream Gray 360	Suitable Trimmers 496 355 Gloss White 499

	Rich Maroon 382	For Doors, Sash, etc.		Light Lead 353	Gloss White 360 363
	Bottle Green 484	498 391		Slate 363	Gloss White 357

(See also S-W Page 5)

Please do not detach color samples. Complete color cards sent upon request.

PAINTING AND STAINING OF EXTERIOR SURFACES (Continued)

tissue. Creosote fills the wood with a fatty substance and unites with the sappy part in forming a peculiar compound which resists organic decomposition. It also has the property of preventing the formation of fungus growths.

Sherwin-Williams Preservative Shingle Stains are penetrating and exceedingly permanent, both as to color and preservative value. Since refined creosote oil is used in these stains, which is free from the rank odor of crude creosote, Sherwin-Williams Shingle Stains do not have the unpleasant odor many times found in products of this type.

Specification—All wooden shingles shall receive one dip coat of Sherwin-Williams Preservative Shingle Stain in the consistency supplied by the manufacturer and in the color selected by the architect. The shingles shall be dipped two-thirds their length in Shingle Stain and thrown aside in loose piles until dry. After the shingles have been laid, one brush

coat of Sherwin-Williams Preservative Shingle Stain of like color shall be applied as it comes from the original container.

Specification No. 16**Metal Roofs (to Paint)**

Discussion—The architect has a choice of specifying Metalastic or SWP (Sherwin-Williams Prepared Paint), the merits of which are covered in the discussion in Specifications Nos. 1 and 9, respectively. The two points which should be watched particularly are that the roof must be dry and free from grease, rosin, etc., and second, that if roof is of galvanized iron, the primer shall be Sherwin-Williams Galvanized Iron Primer. Any finishing coat desired may be applied over Galvanized Iron Primer. Where Galvanized Iron Primer is used, this takes the place of the first coat, and two subsequent coats of paint in the desired color will be sufficient.

PAINTING AND STAINING OF EXTERIOR SURFACES (Continued)

Specification—Before beginning painting of the roof the contractor shall make sure that the roof is free from all grease, rosin, acid and dirt, and that the surface is perfectly dry. Three brush coats of Sherwin-Williams Metalastic, or where a lighter shade is desired, SWP (Sherwin-Williams Paint) shall be applied to the metal roofing in the consistency supplied by the manufacturer. (See Discussion where roof is of galvanized iron.)

Specification No. 17

Woodwork—Stained and Varnished Finish

Discussion—For the staining and varnishing of exterior woodwork, the use of Sherwin-Williams Oil Stain is recommended in preference to other types of stains, such as Sherwin-Williams Acid Stain, Sherwin-Williams Handcraft Stain (spirit penetrating). The reason for this is that varnish may be applied directly over oil stains, whereas the other types mentioned require sealing with a thin coat of shellac to prevent bleeding of the stain into the finishing coat of varnish which interferes with proper drying.

Varnish may be applied directly over any and all of the Sherwin-Williams Oil Stains with the exception of Rich Mahogany and Brown Mahogany. These require the use of a sealing coat of shellac before varnishing and are not recommended for exterior use.

It is preferable not to use shellac in exterior finishing, where avoidable, for the reason that this material is not sufficiently elastic to withstand the extreme expansion and contraction produced by changes in temperature. In many instances when open grain woods are used, such as oak, chestnut, walnut, and mahogany, the color of the wood can be modified sufficiently through the use of Sherwin-Williams Paste Wood Fillers, the dark colors of which carry a certain amount of staining power.

See Color Samples on S-W Pages 11 and 15.

Specification—All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

Apply one coat of Sherwin-Williams Oil Stain in the shade selected by the architect. Let dry thoroughly.

Open grain woods require filling with Sherwin-Williams Paste Wood Filler. This is furnished in paste form to be reduced to brushing consistency with benzine. Apply in the color selected by the architect and when the material is partly set, wipe off across the grain of the wood with burlap or excelsior, then wipe clean with a soft cloth. Allow 24 hours for the filler to dry. Apply three coats of Sherwin-Williams Rexpa Varnish as follows:

First coat to be thinned with pure turpentine in the proportion of one pint to the gallon. Second and third coats are to be applied in the consistency supplied by the manufacturer. Allow sufficient time for drying between coats and sand first two coats lightly with No. 00 sandpaper. Leave last coat in full gloss or for rub finish, specify: "When sufficiently dry, rub the varnish to a dull finish with powdered pumicestone and water."

Note: Where acid stains or handcraft stains are specified, a thin coat of pure shellac shall be applied in place of the first coat of Rexpa Varnish.

Specification No. 18

Porch Floors and Canvas Decks (New) to Paint

Discussion—Sherwin-Williams Porch and Deck Paint is made for porch floors, decks and similar heavy duty surfaces. It dries hard to withstand the scuffing of feet. Porch and Deck Paint has a good gloss and will give complete satisfaction in service and appearance.

Specification—Three coats of Sherwin-Williams Porch and Deck Paint in the color selected by the architect shall be applied. The first coat shall be thinned with one quart of pure turpentine to the gallon of paint. The second coat shall be thinned with one pint of pure turpentine to the gallon of paint, and the third coat shall be applied as it comes from the container. Sufficient time for thorough drying shall be allowed between coats.

Specification No. 19

Porch Ceilings—Natural Varnish Finish

Discussion—A spar varnish is recommended for all varnish surfaces exposed to the weather. A spar varnish contains a high percentage of oil in relation to the gums. This gives it elasticity to accommodate itself to expansion and contraction caused by changing temperature, and provides the power to resist weathering. We recommend Sherwin-Williams Rexpa made originally for use on airplanes and unsurpassed for exterior finishing.

Specification—All porch ceilings shall be finished with three coats of Sherwin-Williams Rexpa Varnish. The first coat shall be thinned in the proportion of one pint of pure turpentine to one gallon of Rexpa. The second and third coats shall be applied without thinning. Forty-eight hours shall be allowed between coats for drying and the first and second coats shall be lightly sanded with No. 00 sandpaper before applying the succeeding coat.

Specification No. 20

Enamel Finish on New Wood and Metal Surfaces

Discussion—Old Dutch Enamel Gloss is unreservedly recommended by Sherwin-Williams for exterior enamel finishing. The architect may depend upon this specification and have full confidence that the finish obtained with this enamel will last for years under the most severe tests.

A most convincing proof of the endurance of Old Dutch Enamel exposed to climatic conditions is found in the fact that leading railways of the country have been using "Old Dutch" for years for the exterior finishing of coaches with complete satisfaction. These cars are exposed to every conceivable climatic condition, ranging from the arid heat of sun baked deserts to the piercing cold of the mountain regions.

Old Dutch Enamel is classed as a long-oil enamel, due to the fact that there is a much larger percentage of specially treated linseed oil in Old Dutch than is possible to incorporate in enamels of the varnish type, hence the life of this enamel is naturally much longer than that of enamels of other types. Old Dutch Enamel has a fine texture, splendid gloss and depth of tone which it retains even after years of exposure.

Where the surface to be finished is of galvanized iron, one coat of Sherwin-Williams Galvanized Iron Primer should be applied as the priming coat.

See S-W Page 9 for Color Samples of Old Dutch Enamel.

Specification—The contractor shall determine through careful inspection whether surface to be finished is dry and in proper condition for finishing. After the priming coat is applied, all knots and pitchy places must be given a coat of pure Orange Shellac.

First Coat—Apply SWP Flat White, reduced in the proportion of one pint raw linseed oil and one pint turpentine to the gallon of paint.

Second Coat—Apply SWP Flat White just as it comes from the can. If it seems too heavy for certain work, thin slightly with equal parts pure raw linseed oil and pure turpentine.

SHERWIN-WILLIAMS
CONCRETE WALL FINISH COLORS

FRENCH GRAY (Gloss)

Please do not detach color samples. Complete color cards sent upon request.

Third Coat—Apply S-W Old Dutch Enamel and SWP Flat White mixed in equal parts.

Fourth Coat—Apply S-W Old Dutch Enamel just as it comes from the package.

Note: S-W Old Dutch Enamel Dull Finish is not designed for exterior use. Old Dutch Enamel Gloss only is recommended for exterior exposure.

Note: The fifth or final enamel coat is to be applied as soon as the fourth coat is sufficiently dry to permit. If, for any unforeseen circumstances, the fourth coat becomes hard before the fifth coat is applied, the fourth coat shall be "mossed" before applying the final coat.

For best results, sand the first and second coats to a smooth surface with No. 0 sandpaper. The third coat shall be sanded smooth with nothing coarser than No. 0000 sandpaper.

FINISHING OF INTERIOR FLOORS

General Discussion

Floors get peculiarly severe wear. It is essential that if satisfaction is to be secured from a floor of any kind, the proper type of finish must be selected and applied in a manner which will insure the right kind of results.

Preparation of the Surface—No floor finish can make up for lack of care in proper preparation of the floor to receive the finish. The surface, whether it be of wood or cement, should be thoroughly dry. Finishing over floors containing dampness is certain to result in the peeling off of the finish later on. After scraping wood floors, sweep out shavings and dirt, and sandpaper to perfectly clean, smooth surface. All spots should be removed before finishing the room. Sweep broom-clean. It is considered a good practice to pick up loose dust by wiping with a cloth dampened with gasoline.

Priming Coat—Under no circumstances should a liquid filler or shellac be used as a first coater on a wood floor that is to be varnished. It is a common saying that a chain is no stronger than its weakest link. Certainly, no varnish finish is any stronger than its grip upon the floor. Varnish applied directly to the wood penetrates into the wood, obtaining a bond with it. Where shellac or liquid filler is used, these finishes prevent varnish from obtaining this bond with the wood, and they themselves have little or no penetration, lying practically entirely on the surface of the wood. No matter how tough or elastic the varnish, a blow that will loosen the shellac or liquid filler and break its hold upon the wood, will bring off the varnish finish with it.

Mar-not Fast-Dri Varnish is specified for the finishing of hardwood floors because we honestly believe it possesses the most desirable qualifications for the purpose. Mar-not Fast-Dri is a varnish made to walk on. It dries with a real luster that wears and continues to look well under service. It retains a refined appearance which harmonizes with fine furniture.

Try your favorite test on Mar-not Fast-Dri Varnish. Take a hammer and dent the wood as deeply as you wish—Mar-not Fast Dri will still cling. Try scratching it—it will not powder or chip. Of course Mar-not Fast-Dri Varnish is water-resisting. Leaky radiators, wet umbrellas and raining in at the windows cause no damage to the Mar-not Fast-Dri floor.

Staining and Filling Floors—The three woods in most general use for flooring in the United States are oak and maple for hardwood floors and edge-grain pine for softwood floors. Maple and pine are close-grain woods and require no filler. Oak is an open-grain wood and paste wood filler is required to fill the pores of the wood, both for appearance and for service.

Sherwin-Williams Paste Wood Filler is made of high grade siliceous color pigment, varnish, oil and a slight amount of drier. It is furnished in paste form and is to be reduced with benzine to a consistency of thick cream for brushing. It is then brushed over the surface of the wood and allowed to stand until partly set, indicated by a partial dulling down of the wet gloss. The surplus

filler is then wiped off across the grain of the wood, using burlap or excelsior, which forces the filler into the pores of the wood, leaving the surface level and ready for the varnish. Wipe clean with a soft cloth.

A very practical method of darkening the tone of an oak floor consists in using Sherwin-Williams Paste Wood Filler in one of the dark colors which will fill the pores of the wood and darken it in one operation. For a natural oak finish, transparent paste filler should be specified.

In order to stain maple or pine, specify Sherwin-Williams Oil Stain, as a paste filler cannot be used on close-grain woods, due to the absence of pores. Such shades as Silver Gray or exceedingly dark shades are not possible to obtain with an oil stain. For this purpose specify Sherwin-Williams Handcraft Stains which, however, will require sealing with shellac before finishing.

Note: These finishes are rarely specified where a full varnish finish is desired, and in this case, a straight shellac finish would be in order, finishing with wax.

Finishing of Stair Treads

The finishing of stair treads is a problem in itself, especially where the stairs are not to be carpeted or protected from the characteristic scraping and scuffing of climbing feet.

Where stair treads are to be finished in an oak color or left in the color of the natural wood, they may be finished in the same manner as recommended for floors, but in much of the modern residential work the scheme of interior decoration calls for staining the stair treads a dark mahogany or walnut color. The type of stain used to produce this effect is such that a floor varnish should not be applied directly over the stain. A spirit penetrating stain or an acid stain used to produce these darker effects reacts on the varnish if applied directly over the stain, resulting in poor drying, so that the finish frequently remains "tacky" or sticky.

In a case of this kind there is no choice but to use a coat of thin pure white shellac to seal the stain into the wood before applying the varnish. Only just enough shellac should be used to seal the stain effectively. For this purpose specify Sherwin-Williams Pure White Shellac (cut four pounds to the gallon), reduced equal parts with denatured alcohol. This will result in a shellac of the proper consistency. After the shellac is dry, three coats of Sherwin-Williams Mar-not Fast-Dri Varnish should be applied, sanding lightly between coats when dry. For a dull finish, rub with powdered pumice and oil, or apply a finishing coat of Mar-not Satin Finish.

Specification No. 21

Natural Varnished Finish on New Floors

See Opex Lacquer Specification No. 21-A

The floors shall be perfectly smooth before any varnish is applied, and shall be thoroughly cleaned of all dust, stains, etc. (For open-grain wood only. The wood shall then be filled with Sherwin-Williams Paste Filler, Transparent, which before becoming hard shall be wiped off across the surface with burlap or excelsior. After allowing twenty-four hours for drying, the

by brush with reasonable liberality. When dry, sand lightly. Two coats of Sherwin-Williams Prepared Wax (Paste) shall then be applied and rubbed to a hard, polished surface with a polishing brush or polishing machine. (Prior to using the floor for dancing, sprinkle Sherwin-Williams Dancing Floor Wax over the surface.)

Specification No. 33

Hardwood Floors (Old) to Revarnish

Discussion—This specification is intended for floors where only the varnish finish is in bad condition, but the floor itself is in good condition. The old varnish finish should be thoroughly sanded and the floor washed with a strictly pure linseed oil soap, such as Sherwin-Williams Flaxoap. No floors should be washed with cheap soaps or cleansers which abound in free alkali as the wood may absorb the alkali during the process of cleaning, which in time cannot help but cause injury to the varnish film. All stains and spots should be thoroughly removed with a solution of oxalic acid. Where the floor is too worn to permit a clear varnish finish, we recommend Flo-Lac Varnish Stain, Specification No. 34, or Floor Enamel, Specification No. 35.

Specification—The floors which are to be refinished shall be thoroughly sanded to remove the gloss of the old finish and then washed with Sherwin-Williams Flaxoap, a 100 per cent pure linseed oil soap. Rinse thoroughly to remove all trace of soap from floors. All spots shall be removed by bleaching with oxalic acid or sanding and scraping. When the floor is thoroughly dry, two coats of Sherwin-Williams Mar-not Fast-Dri Varnish shall be applied. The first coat shall be reduced in proportion of one pint of pure turpentine to one gallon of varnish. The second coat shall be applied as it comes from the original container. Sufficient time for drying be allowed and the surface should be sanded lightly with No. 00 sandpaper between coats.

Note: Where the old varnish finish is in bad condition and the floors in good condition, it may be advisable to remove the old varnish from the surface with Sherwin-Williams Taxite, paint and varnish remover. If

this is done, the floor should be wiped off thoroughly with waste saturated with benzine. When dry, the floor can then be refinished, following the specification for refinishing of new floors.

Specification No. 34

Discolored Hardwood and Softwood Floors—Grained, Stained and Varnished

The floors shall be thoroughly scrubbed with warm water and Sherwin-Williams Flaxoap (a 100% pure linseed oil soap). Rinse thoroughly and let dry. After all grease and dirt have been removed and the surface thoroughly dry, apply two coats of Sherwin-Williams Flo-Lac Ground Color. When dry, grain surface with Sherwin-Williams Graining Preparation, using a regular half round graining tool, a steel graining comb, an old whisk broom, or simply stippling with a cloth, depending upon the texture desired. Apply one coat of Sherwin-Williams Flo-Lac (Varnish Stain) in the color selected, reducing slightly with turpentine if required for easy brushing.

Note: If deeper tone found desirable, apply second coat of Flo-Lac.

As a protective finish, which will prevent the color varnish coat from wearing thin and causing the floor to look spotty, apply a coat of Sherwin-Williams Mar-not Varnish in the consistency supplied by the manufacturer. Sufficient time should be allowed for thorough drying between coats, and all coats except the last should be lightly sanded with No. 00 sandpaper.

Specification No. 35

Old Floors, to Paint

Discussion—Sherwin-Williams Floor Enamel is made for floors. It will stand up under service and continue to look well under hard wear. This paint dries well and hard and does not become sticky or tacky in warm weather.

Specification—All old floors shall be thoroughly cleaned with warm water and Sherwin-Williams Flaxoap (a 100 per cent pure linseed oil soap) before painting. When the floor is thoroughly dry, two coats of Sherwin-Williams Floor Enamel, in the color selected by the architect, shall be applied, thinning the first coat in the proportion of one pint of pure turpentine to one gallon of paint.

PAINTING AND DECORATING OF INTERIOR WALLS

Specification No. 36

Washable Flat Finish—Smooth, Sand Finish and Textured Plasters, Composition Board, Canvas Covered Walls

Discussion—Sherwin-Williams Flat-Tone is a washable oil paint for interior use which dries with a dull, flat finish of exquisite visual texture. Flat-Tone was the pioneer of the modern wall and ceiling decoration. Today it is probably the best known wall finish in the world. It will be found adorning the walls of public buildings in not only this country, but better classes of buildings in Canada, Mexico, Philippine Islands, China, Australia, England and the Argentine as well.

Its beauty of finish is probably the leading characteristic of Flat-Tone, but of almost equal importance is its durability, its sanitary qualities and its economy. The painter likes Flat-Tone because of its ease of application, strong hiding power, property of leveling out well, with freedom from brush marks. Of equal importance to the painter is its unusual wet edge which permits him to get back into it long after other flats have set to the point where brushing is impossible. Even with this slow early drying, it still dries hard over night under average drying conditions. It can be stippled if desired to eliminate any trace of brush marks, but for regular stipple work we recommend Wall Paint No. 96 (Heavy Body) (See Specification No. 41) which is similar to Flat-Tone except it has been bodied up to produce a more pronounced stipple.

Satisfactory finishing of walls is only possible where the surface has been sealed tight to prevent the

finishing coat from striking in, thereby giving a spotty or non-uniform effect. Sherwin-Williams Wall Primer and Sealer is made especially for first coat work on walls and should be used according to specifications. (See Specification No. 40.)

The following specifications are recommended as being the most practical where Flat-Tone is applied on new walls and ceilings.

Specification—The contractor shall inspect the walls and ceilings before starting work to make sure that the surfaces to be painted are dry and in proper condition for finishing.

First Coat—Apply Sherwin-Williams Wall Primer and Sealer according to Specification No. 40. (If hot spots or suction are evident in the plaster after the first coat has been applied according to specifications, the architect should be notified at once as they will need touching up with another coat of Wall Primer and Sealer.)

Second Coat—Apply Sherwin-Williams Flat-Tone.

Note: Allow to dry thoroughly between coats. Twenty-four hours is usually sufficient. When three-coat work is planned, the addition of two quarts of Wall Primer and Sealer to the gallon of Flat-Tone for the second coat will present a tighter and improved surface on which to apply the third coat.

Special Note: Painting Newly Plastered Surfaces—THE SHERWIN-WILLIAMS Co. never advocates the painting of plastered walls which have not been given an opportunity to dry out thoroughly. If "green" plastered walls are painted, there is always danger. However, there are certain occasions where walls which have not been given sufficient time to dry out thoroughly must be painted for commercial reasons; apply one coat Wall Primer and Sealer (see Specification No. 40). Where indications point to the presence of alkali (hot spots), we recommend washing the surface with a solution of 1½ to 2 pounds of zinc sulphate in a gallon of water.

This should be brushed on the surface and sufficient time should then be allowed for drying before the first coat of Sherwin-Williams Wall Primer and Sealer is applied. We, of course, do not guarantee that this procedure will prevent dis-

PAINTING AND DECORATING OF INTERIOR WALLS (Continued)

solving of the finish nor that it will not peel. This danger is always present when "green" plaster must be painted.

Specification—Repainting—Remove all soot, dirt, grease or loose paint. Apply one coat Sherwin-Williams Wall Primer and Sealer to all bare spots and patches. If the surface is porous apply one coat of Wall Primer and Sealer over the entire surface. On surfaces in fairly good condition or where portions of the wall are fairly tight, add two quarts Sherwin-Williams Flat-Tone to the gallon of Sherwin-Williams Wall Primer and Sealer.

For the second coat Sherwin-Williams Flat-Tone should be applied as it comes in the package.

Allow to dry thoroughly between coats. Twenty-four hours is usually sufficient under normal drying conditions.

Specification No. 36Y

Semi-Lustre Finish—Smooth, Sand Finish and Textured Plasters, Composition Board, Canvas Covered Walls

Discussion—Sherwin-Williams Semi-Lustre has a soft, mellow lustre and is used where the glare of a gloss finish is objectionable and where it is necessary to have a more durable and more washable surface than is possible with a flat wall paint. The following specifications are recommended as being the most practical where Semi-Lustre is used on walls and ceilings:

Specification—The contractor shall inspect the walls and ceilings before starting work to make sure that the surfaces to be painted are dry and in proper condition for finishing.

First Coat—Apply Sherwin-Williams Wall Primer and Sealer according to Specification No. 40. (If hot spots or suction are evident in the plaster after the first coat has been applied according to specifications, the architect should be notified at once as they will need touching up with one coat of Wall Primer and Sealer.)

Second Coat—Apply Sherwin-Williams Semi-Lustre, using it just as it comes from the package.

Notes: Allow to dry thoroughly between coats. Twenty-four hours is usually sufficient. Where three-coat work is planned apply Semi-Lustre just as it comes from the package.

Note Special Note: "Painting newly plastered surfaces" under Specification No. 36.

Specification—Repainting—Remove all soot, dirt, grease or loose paint. Apply one coat Sherwin-Williams Wall Primer and Sealer to all bare spots and patches. If the surface is porous apply one coat of Wall Primer and Sealer over the entire surface. On surfaces in fairly good condition or where portions of the wall are fairly tight, add two quarts Sherwin-Williams Semi-Lustre to the gallon of Sherwin-Williams Wall Primer and Sealer.

For the second coat Sherwin-Williams Semi-Lustre should be applied as it comes in the package.

Allow to dry thoroughly between coats. Twenty-four hours is usually sufficient under normal drying conditions.

Specification No. 37

Flat-Tone Multi-Color Effects on New Walls—Rough or Smooth Plaster, Canvas Covered Walls, or Plaster Board

See *Opex Lacquer Specification No. 37-A*

Discussion—Flat-Tone Multi-Color Effects make it possible for the decorator to produce an endless variety of color and texture effects with Flat-Tone through the simple means of stippling the color with a sponge. (See samples of Flat-Tone Multi-Color Effect on S-W Page.) This is a development in interior decoration introduced to the architects of this country by THE SHERWIN-WILLIAMS Co. The process has been used effectively in all types of buildings, ranging from residences to clubs, hotels, theaters and public buildings. Flat-Tone Multi-Color Effects have the very practical advantage of not showing finger marks or soil as readily as plain colors, although they are of course every bit as washable as Flat-Tone.

The colors to be used in securing the various Flat-Tone Multi-Color Effects are specified for each effect and may be used as they come from the original container, although for best results the addition of Flat-

Tone Mixing Size to each stipple color is recommended, in the proportion of one part of size to three parts of Flat-Tone. (Except in certain instances where a particular effect is required as specified.)

Multi-Color Effects are applied over a foundation color of Flat-Tone. (See specification.)

For stippling, use a sponge of good, even, open texture. A large sponge is desirable for plain surfaces, although the decorator will find smaller sponges very helpful for use in corners and inaccessible areas. Stippling the wall with the top of the sponge produces a speckled print while the bottom of the sponge yields a lacy print of a very interesting texture and is recommended. Wash the sponge out in warm, clean water and trim the bottom with large shears to a smooth printing surface, clipping out any large solid chunks which would be likely to make a daub. Test the sponge on the window pane or a piece of dry newspaper to determine the kind of print it will give.

When ready to stipple—which can be done as soon as the foundation coat is flatted out fairly hard—pour out a small quantity of the first stipple color on a piece of board or tin, as convenient. Use the sponge fairly damp in stippling and rub the bottom of it into the paint so as to thoroughly cover the surface. Tap the sponge once or twice on a dry paper to remove surplus paint and stipple directly on to the wall. Use a straight firm stroke. Do not use a twisting or turning motion. Apply each print of the stipple next to the preceding one until the surface is entirely covered. Reload the sponge as often as necessary.

Where two or more stipple colors are specified, the next color may follow immediately if convenient. It is not necessary to wait until the first coat is dry or hard. Clean the sponge out in gasoline and rinse in water after finishing stippling or before changing to another color.

A painter of average ability and intelligence can, with very little practice, turn out a most suitable job of Flat-Tone Multi-Color work by following the brief directions given here. The cost of Multi-Color work using two coats for the foundation color should not exceed three-coat straight work because of the rapidity with which the Multi-Color stipple is applied. The amount of material required for applying a stipple coat is negligible. A quart of stipple color is easily enough for a fair sized living room.

Specification—After the contractor has inspected the wall surfaces to be painted to insure that they are perfectly dry and in proper condition for finishing, apply one coat Sherwin-Williams Wall Primer and Sealer according to Specification No. 40, tinted to the shade of Flat-Tone selected with S-W First Quality Oil Colors. (If hot spots or suction are evident in the plaster after the first coat has been applied according to specifications, the architect should be notified at once as additional spotting coat will be necessary.)

Allow to dry thoroughly before recoating. Twenty-four hours is usually sufficient under normal drying conditions.

The second coat should be Sherwin-Williams Flat-Tone in the color selected by the architect for the ground color and should be applied just as it comes in the package. As soon as this ground coat has been applied and approved by the architect, the surface shall be sponge stippled with the color of Flat-Tone specified as the stipple color following detailed printed directions issued by THE SHERWIN-WILLIAMS Co. for producing Flat-Tone Multi-Color Effects.

Specification No. 38

Flat-Tone System Finish on New Walls (Glazed or "Tiffany" Effects)—Rough or Smooth Plaster, Canvas Covered Walls, or Wall Board

Discussion—Flat-Tone System Effects, frequently designated as Tiffany Effects, are produced over a foundation color of Flat-Tone or S-W Semi-Lustre.

PAINTING AND DECORATING OF INTERIOR WALLS (Continued)

The finishing glaze coat is produced with Flat-Tone Glazing Liquid which is tinted to the desired color with S-W First Quality Oil Colors. This coat is stippled as applied, using a cloth, sponge, or brush depending upon the texture or kind of print or pattern desired. The translucent quality of this glaze coat permits the color of the ground coat to show through to a certain extent resulting in a luminous depth of color not possible to produce with a flat paint alone. This form of decoration costs more both in material and labor than three-coat flat work, but possesses decorative and architectural characteristics indispensable for certain treatments, such as "antique plaster," Tiffany work, etc. Flat-Tone Glaze System Effects are easy to wash and do not show soil readily.

See Color Samples on S-W Page 19.

Specification—After the contractor has inspected the wall surfaces to be finished to insure that they are perfectly dry and in proper condition for finishing, apply one coat Sherwin-Williams Wall Primer and Sealer according to Specification No. 40 tinted to the shade of ground color selected, with Sherwin-Williams First Quality Oil Colors. (If hot spots or suction are evident in the plaster after the first coat has been applied according to the specification, the architect should be notified at once as spotting coat will be necessary.)

Second coat shall consist of Sherwin-Williams Wall Paint No. 96 (Heavy Body), stippled when desired. This should be thoroughly dry and hard before glazing.

If heavy texture is not desired, use Flat-Tone instead of Wall Paint No. 96.

Note: Sherwin-Williams Wall Paint No. 96 (Heavy Body), when used as it comes in the package, produces, when stippled, a beautiful pebble round stipple so much desired under glazing. Also produces a different, entirely new wall effect when tinted and stippled on plain walls, paneled walls above new colored tiles in bath rooms, etc. (see Specification No. 41).

As soon as the ground coat is approved by the architect, the surface shall be coated with Sherwin-Williams Flat-Tone Glazing Liquid, tinted with the glaze color specified for the effect desired—the depth of color or the intensity to be approved by the architect (Optional: The glaze coat shall be applied so as to graduate in tone, from a dark color at the base of the wall to a mere tint at the top).

Specification No. 39**Flat-Tone and Plastic Pigment**

Discussion—Sherwin-Williams Flat-Tone and Plastic Pigment is a paint product with which painters are familiar. It is really Flat-Tone, brought up to the consistency desired by the painter himself, made by simply stirring Plastic Pigment into the Flat-Tone.

Plastic Pigment dries hard, and with it rough effects in any design are possible. Real textured walls result—low relief, so frequently to be desired. The great saving over rough plaster is something that bears consideration. Flat-Tone and Plastic Pigment can be applied over nearly any variety of wall surface. When applied, you have a *painted* wall—not one that needs painting.

Specification—New Unpainted Surfaces—Plaster and wood, or any porous material, such as wall board, canvas, etc., require sealing with a coat of S-W Wall Primer and Sealer. Let this dry hard.

Previously Painted Surfaces—This refers to surfaces painted with an oil paint. Loose or scaly paint should be scraped off and these bare spots sealed as for new work. Flat-Tone Plastic Pigment may then be applied.

Walls painted with water paint should be washed clean, allowed to dry, then sealed in the same manner as for new work.

Glossy finishes should be sandpapered dull to provide a tooth and assure proper adhesion.

Portion of Plastic Pigment Required—For medium textures, mix in the proportion of twenty-five pounds of Plastic Pigment to five gallons of Flat-Tone. To a gallon of this mixture add from one-half to one pint of S-W Japan Drier.

It is recommended that this mixture be allowed to stand overnight before using. In this proportion the material will be easily applicable with a brush, and will hold its form or print

on the surface perfectly. More Plastic Pigment may be added for higher relief.

If the surface is to be glazed, it is important that it be absolutely tight. In this case it is recommended that one coat of Wall Primer and Sealer, tinted to the desired shade, be applied before glazing.

The various shades of Flat-Tone will be only very slightly changed by the addition of Plastic Pigment. Any shade may be used successfully.

Specification No. 40**Wall Primer and Sealer**

Discussion—Wall Primer and Sealer is just what the name implies, a primer and sealer for all types and kinds of walls in mills, public and office buildings and homes.

The first coat must stop suction, it must seal the surface. It must have tightness with sufficient tooth to permit satisfactory bonding of the succeeding coat. This matter was given careful consideration in the development of Sherwin-Williams Wall Primer and Sealer as was also, easy working, which would allow the painter to get over a large area. Sherwin-Williams Wall Primer and Sealer is so balanced in pigment, oil, gum and thinner as to get the maximum in all of these essentials that are so important to the painter as well as to make possible highly satisfactory finished results.

Specification—Apply Wall Primer and Sealer as it comes from the package except on a hard, tight, putty-coat plaster, particularly where it has been troweled to a high glaze. In this case it is sometimes desirable to add from a pint to a quart of Flat-Tone, Wall Paint No. 96, or XXX Enamel Undercoater (whichever is being used on the next coat) to the gallon of Wall Primer and Sealer. (For tinting, use only Sherwin-Williams First Quality Oil Colors.)

Before the wall paint is applied, the surface should be carefully inspected by the contractor, and if any flat spots appear as a result of incomplete sealing, or if flat streaks show over a crack or patch, all such surfaces should be given another coat of Wall Primer and Sealer.

Allow sufficient time for thorough drying before applying succeeding coat. Under normal conditions 24 hours will be sufficient.

On such surfaces as sized muslin, sanitas or primed metal, use equal quantities of Wall Primer and Sealer and Flat-Tone for the first coat.

Specification—Repaint Work—Remove all soot, dirt, grease and loose paint. Apply one coat Sherwin-Williams Wall Primer and Sealer to all bare spots and patches.

Spongy porous surfaces (applies particularly to surfaces previously painted with a number of coats of flat wall paint) should be given a coat of Sherwin-Williams Wall Primer and Sealer. (This is necessary even though the paint film is in good condition since a surface on which a number of coats of flat wall paint have been applied is as porous or more so than the original plaster.)

Specification No. 41**Wall Paint No. 96 (Heavy Body)**

Discussion—This is practically Flat-Tone with added pigment to give it a heavier body. This product works very satisfactory under the brush despite its heavy body and is an ideal product for stippling, giving that soft round pebbly effect now so much in demand in place of the sharp stipple effects obtained with lead and oil or other flat wall paints. (The sharp effects can also be obtained with Wall Paint No. 96 when desired, by simply extending the length of time before stippling.)

It is especially desired by some painters for use on old surfaces with dark colors which are difficult to cover. One coat Sherwin-Williams Wall Primer and Sealer and one coat Sherwin-Williams Wall Paint No. 96 (Heavy Body) produces a very satisfactory two-coat job over such surfaces. It carries a trifle more sheen than regular Flat-Tone which is desired by some painters who use it in large office buildings, hotels, etc.

Specification—Apply one coat Sherwin-Williams Wall

PAINTING AND DECORATING OF INTERIOR WALLS (Continued)

Primer and Sealer according to Specification No. 40. Follow with one coat of Sherwin-Williams Wall Paint No. 96 (Heavy Body) applied just as it comes in the package for stipple work.

Note: Where surface is not to be stippled the coat of Sherwin-Williams Wall Paint No. 96 should be applied, first reducing each gallon with about $\frac{1}{2}$ pint turpentine.

Tiffany Effects—See Specification No. 38.

Specification No. 42

Enamelastic Enamel Finish for Walls

Discussion—Sherwin-Williams Enamelastic is a full oil enamel that is exceptionally easy working with good flowing, fullness and covering and unusual staying white qualities.

Specification—Three Coat New Work on Walls—See that the surface to be finished is perfectly dry and free from all loose plaster dust. Apply one coat Sherwin-Williams Wall Primer and Sealer according to Specification No. 40.

For the second coat apply Sherwin-Williams XXX Enamel Undercoater reduced with one pint pure turpentine and one quart Enamelastic to the gallon.

For the third and final coat apply Sherwin-Williams Enamelastic Gloss or Satin Finish reduced with $\frac{1}{4}$ pint pure turpentine to the gallon.

For satisfactory two coat enamel work on walls omit the second coat. On such work apply Enamelastic over Wall Primer and Sealer. (First and third coats as above.)

Allow to dry thoroughly between coats.

Specification—Refinishing Walls with Enamelastic—Remove all soot, dirt, grease and loose paint and apply one coat Sherwin-Williams Wall Primer and Sealer to all bare spots and patches. Porous surfaces such as walls previously painted with a number of coats of flat wall paint (which are often more porous than the original plaster) should be coated with Sherwin-Williams Wall Primer and Sealer applied according to Specification No. 40.

The second coat should consist of XXX Enamel Undercoater reduced with one quart Enamelastic and one pint pure turpentine to the gallon.

For the third coat apply Enamelastic Gloss or Satin Finish reduced with $\frac{1}{4}$ pint pure turpentine to the gallon.

Note: If surface is in good condition and tight, omit the coat of Wall Primer and Sealer.

Allow to dry thoroughly between coats.

To match special shades submitted by the architect, tint with Sherwin-Williams First Quality Oil Colors.

Specification No. 42X

Enamelo-Enamel Finish for Walls

Discussion—Sherwin-Williams Enamelo is intended for interior use where time will not permit the use of the slower drying Enamelastic which is a full oil enamel. Enamelo dries dust free in one and one-half hours, hard in six to eight hours and very hard in twenty-four hours.

Although it is a varnish enamel, it has easy working, flowing, fullness and covering which qualities are quite unusual in this type of enamel.

Specification—Three Coat New Work on Walls—See that the surface to be finished is perfectly dry and free from all loose plaster dust. Apply one coat Sherwin-Williams Wall Primer and Sealer according to Specification No. 40.

For the second coat apply Sherwin-Williams XXX Enamel Undercoater reduced with one pint pure turpentine and one quart Enamelo to the gallon.

For the third and final coat apply Sherwin-Williams Enamelo just as it comes from the package.

For satisfactory two coat enamel work on walls omit the second coat. On such work apply Enamelo over Wall Primer and Sealer. (First and third coats as above.)

Allow to dry thoroughly between coats.

Specification—Refinishing Walls with Enamelo—Remove all soot, dirt, grease and loose paint and apply one coat Sherwin-Williams Wall Primer and Sealer to all bare spots and patches. Porous surfaces such as walls previously painted with a number of coats of flat wall paint (which is often more porous than the original plaster) should be coated with Sherwin-Williams Wall Primer and Sealer applied according to Specification No. 40.

The second coat should consist of XXX Enamel Under-

coater reduced with 1 pint of turpentine and 1 quart Enamelo to the gallon.

For the third coat apply Enamelo just as it comes from the package.

Note: If the surface is in good condition and tight, omit the coat of Wall Primer and Sealer.

Allow to dry thoroughly between coats. To match special shades submitted by the architect, tint with Sherwin-Williams First Quality Oil Colors.

If Enamelo is too heavy for certain work thin slightly with pure turpentine only.

Specification No. 43

Old Dutch Enamel Finish

Discussion—For the best grade of enamel finish on walls, the following specification is recommended.

On New Walls—

Specification—(4 Coat Work)—Care should be taken to see that the surface to be finished is perfectly dry and free from all dust and grease. Apply a first coat of Sherwin-Williams Wall Primer and Sealer according to Specification No. 40.

For the second coat apply Sherwin-Williams XXX Enamel Undercoater thinned with one pint pure turpentine to the gallon.

The third coat should consist of XXX Enamel Undercoater and Old Dutch Enamel mixed in equal parts and thinned with one pint pure turpentine.

For the fourth and last coat apply Sherwin-Williams Old Dutch Enamel reduced with about $\frac{1}{4}$ pint pure turpentine to the gallon.

Allow to dry thoroughly between coats.

Where special shades are made to match sample submitted by architect, Sherwin-Williams First Quality Oil Colors should be used for tinting.

Old Walls—

Specification—Refinishing Walls with Old Dutch Enamel—Remove all soot, dirt, grease and loose paint and apply one coat Sherwin-Williams Wall Primer and Sealer to all bare spots and patches. Porous surfaces such as walls previously painted with a number of coats of flat wall paint (often more porous than the original plaster) should be coated with Sherwin-Williams Wall Primer and Sealer applied according to Specification No. 40.

The second coat should consist of Sherwin-Williams XXX Enamel Undercoater reduced with one pint pure turpentine and one quart of Old Dutch Enamel to the gallon.

For the third coat apply Sherwin-Williams Old Dutch Enamel reduced with about $\frac{1}{4}$ pint pure turpentine to the gallon.

Allow to dry thoroughly between coats.

Note: For three coat work omit the second coat.

Specification No. 44

XXX Enamel Undercoater—New Walls

Discussion—Unquestionably the best enamel undercoater on the market today. It is easy brushing and flows out smoothly when directions are followed. It has very easy sanding almost as easy as shellac. In its manufacture special consideration has been given to tightness of surface. XXX Enamel Undercoater seals tight, which is responsible for the satisfactory way in which it holds out enamel.

Specification—See Specifications No. 42, and 43.

Specification No. 45

Enamel Finish on Keene's Cement

Opex Lacquer Specifications No. 46A.

Follow Specification No. 43 for Old Dutch Enamel finish or Specification No. 42 for the more economical Enamelastic finish, following same instructions as are given for new plaster.

Specification No. 46

Interior Brick, Tile or Concrete Walls to Paint—Dull Finish

Follow Specifications No. 36 or No. 41.

If special shade is used tint with Sherwin-Williams First Quality Oil Colors to color selected by architect.

Note: For semi-gloss finish specify Sherwin-Williams Semi-Lustre Wall Paint in place of either Flat-Tone or Wall Paint No. 96 (Heavy Body).

PAINTING AND DECORATING OF INTERIOR WALLS (Continued)

Specification No. 47

Save-Lite for Mill Walls

Discussion—Save-Lite is furnished in three types of finishes: Flat White, Gloss White, and Eg-Shel White.

Sherwin-Williams Save-Lite Eg-Shel Finish is our standard recommendation for the painting of walls and ceilings in mills, loft buildings, service corridors, printing establishments and in all workrooms where it is of the utmost importance to provide the maximum amount of working light with proper diffusion so as to avoid eye strain which results from the use of glossy paints which reflect the light and in fact even produce hard shadows as well as high lights. A room finished in Save-Lite Eg-Shel White will be found on accurate measurement to be lighter than a similar room finished in gloss white.

Save-Lite Eg-Shel White provides all the ease of cleaning found in the gloss finishes. It washes easier and retains its whiteness longer than a flat wall finish. Save-Lite is enjoying a remarkable success and is being used in many of the most prominent manufacturing plants in the country as a standard upkeep product.

Specification—Before painting walls and ceilings, the contractor shall make certain through careful inspection that the surfaces to be painted are in proper condition. New surfaces, such as plaster, wood, composition, etc., should be properly sealed with Sherwin-Williams Wall Primer and Sealer. One or more spray coats, or not less than two brush coats of Save-Lite should be applied, to within five feet of the floor. Old surfaces may not need the sealer, but the same painting specifications apply.

For hand brushing; Save-Lite Eg-Shel White can be used as it comes in the package. If it seems too heavy for certain work, thin slightly with S-W Reducer No. 74 or Pure Turpentine.

For spray application; material should be thinned using from one pint to one quart of S-W Reducer No. 74 or Pure Turpentine to the gallon of Eg-Shel White. Air drying time to recoat, 24 hours.

A dado five feet in height with a three-inch strip of different color at the top shall be painted with two coats of S-W Dado Enamel in the color selected by the Architect.

Specification No. 48

Save-Lite Fume-Resisting White Finish for Interior Walls and Ceilings

Discussion—Architects and Engineers have occasion frequently to specify a wall finish for laboratories and manufacturing plants where it is essential to use Fume-Resisting Paints for finishing walls and ceilings.

Through continuous research and experimenting in rubber mills and manufacturing plants, Sherwin-Williams has developed a White Paint which will resist the action of sulphur fumes and other acid fumes without turning color badly. This White Paint is furnished in three degrees of gloss: Save-Lite Fume-Resisting Flat White; Save-Lite Semi-Gloss White; Save-Lite Gloss White.

In developing each one of these products, THE SHERWIN-WILLIAMS Co. have arrived at a formula which we believe represents material that will meet the requirements of the maintenance engineer for the painting of interior walls and ceilings in industrial plants where considerable acid fumes are present. In manufacturing these finishes we have incorporated the proper combination of pigments and especially prepared vehicles which make it possible for these products to retain their whiteness under heat and ordinary chemical fumes.

Save-Lite Fume-Resisting White Finishes are resistant to the ordinary types and concentrations of fumes arising from sulphur, chlorine, ammonia and tobacco, such conditions as prevail in rubber plants, laundries, bakeries, dye and starching rooms in textile mills and cure rooms in cigar factories.

Specifications—Before proceeding with the painting of all walls, ceilings, etc., contractor shall inspect the surfaces to be painted to insure the fact that they are in proper condition for finishing. New surfaces such as plaster, wood, composition board, etc., should be properly painted with S-W Wall Primer and Sealer. One or more spray coats or not less than two brush coats should be applied. Old surfaces may not need the Sealer but the same painting specifications apply.

For hand brushing, Fume-Resisting Finishes should be

applied as they come from the package. If too heavy for certain work, thin slightly with S-W Reducer No. 74 or Pure Turpentine. For spraying these materials should be thinned, using from one pint to one quart of Reducer No. 74 or Pure Turpentine to the gallon of Fume-Resisting White. Air-drying time to recoat, 24 hours.

Specification No. 49

New Plaster Walls—Water Paint Finish

A first coat consisting of Sherwin-Williams Wall Primer and Sealer or Sherwin-Williams Flat-Tone Mixing Size, reduced one-third with turpentine or benzine, shall be applied to the wall to stop suction and seal the wall.

After sufficient time has been allowed for drying, a second coat consisting of Sherwin-Williams Decotint, in color selected by the architect, mixed with water in accordance with the manufacturer's directions for application, shall be applied with a wide kalsomine brush, care being taken to secure perfect covering.

Specification No. 50

Washable Flat Painted Finish for Walls Previously Finished with an Oil Paint

All cracks, holes, etc., shall be carefully filled with plaster or plaster of paris, as the case requires, to a level surface. All loose plaster, paint, dirt, grease, etc., shall be removed from the surface before any paint is applied. All newly plastered sections shall receive a priming coat consisting of Sherwin-Williams Wall Primer and Sealer applied according to Specification No. 40. Then follow specifications given for repainting under Specification No. 36 or Specification No. 41.

Specification No. 51

Dampproofing Interior Walls Above Grade (Plaster Bond)

Discussion—Sherwin-Williams Plaster Bond is a specially prepared paint of the asphalt type which is applied, *without heating*, on inside brick, tile or concrete walls above grade before plaster is applied, to serve as a dampproofing and to do away with the necessity for furring or lathing.

Sherwin-Williams Plaster Bond may be applied by either brush or spray method. If the brush method is to be used, a three or four-knot roofing brush is recommended, although a Tampico brush may be used, if desired. Sherwin-Williams Plaster Bond dries slowly, and twenty-four hours after it has been applied, it is in the tacky condition which is ideal for the application of plaster. As the plaster dries out, the Plaster Bond also dries, resulting in a tenacious bond. Sherwin-Williams Plaster Bond covers 400 to 500 square feet to the gallon, one coat—varying with the porosity of the wall.

The outstanding features of Sherwin-Williams Plaster Bond are as follows:

Dampproof walls.

Prevents staining of plaster.

Makes furring or lathing unnecessary; thereby saving space in rooms and reducing construction costs.

Eliminates space between plaster and wall and thus does away with breeding spaces for vermin.

Aids in fireproofing by eliminating wood and spaces between walls and plaster.

Note: This material is not designed or intended for use on ceilings or coves and should never be used for anything but perpendicular wall work.

Specification—The inside surfaces of the brick, tile or concrete exterior walls above grade which are to be plastered, shall be dampproofed with Sherwin-Williams Plaster Bond. All surfaces to be treated shall be dry and clean, and free from frost. One full coat of Plaster Bond shall be applied in the consistency supplied by the manufacturer. Care shall be taken that the entire surface is thoroughly covered. A retouching or "spotting coat" shall be applied to those sections where any voids or pinholes appear after the Plaster Bond has been absorbed into the walls. When complete, the surface shall have a uniform black appearance.

First coat of plaster shall be applied between twenty-four and seventy-two hours after the Plaster Bond has been applied.

FINISHING OF INTERIOR WOOD TRIM

General Discussion

No one appreciates more than the architect the decorative value of properly finished woodwork. This section, therefore, is offered to provide information in the simplest and most useful form which will enable the architect to specify the definite procedure necessary to produce the desired effect.

Open and Close Grain Woods—The majority of hardwoods, with the exception of maple, are open grain; i. e., have open pores which follow the figure at the grain. The decorator turns this characteristic to advantage when it is desirable to emphasize the character of the grain. For example, mahogany finishes are improved through emphasizing the grain with a black or red-black paste filler. Silver gray finishes are improved by using a light colored toner, either white or gray, which usually is lighter than the general color of the wood. Several years ago the mission finish was popular. This consisted of a stain and a light coat of shellac and dull varnish. It left the pores of the wood unfilled and served only to protect the wood, retaining a sort of craftsman quality. The same idea is used in so-called open pore finishes for walnut furniture and woodwork.

Close-grain woods have no open pores and do not require the use of a paste filler. Needless to say, a paste filler is an additional coat in the finishing process and naturally adds to the cost of the finish. Architects should bear this in mind when selecting wood trim, where cost of finishing is an important factor.

In order to differentiate readily between open-grain and close-grain woods, so that architects may know which of these woods require paste wood filler in the finishing process and which do not, a list of the better known American building woods under each type is given hereunder:

Open-Grain Woods			
Ash	Chestnut	Mahogany	Rosewood
Butternut	Elm	Oak	Walnut
		Hickory	
Close-Grain Woods			
Basswood	*Cherry	Hemlock	Redwood
Beech	Cypress	Maple	Spruce
*Birch	Fir	Pine	Sycamore
Cedar	Gumwood	Poplar	Whitewood

*Will take a paste filler where desired to emphasize the grain.

Varnishes for Interior Finishing—Sherwin-Williams offers two varnish leaders for interior woodwork trim—Scar-not Varnish for a full varnish, and Sherwin-Williams Velvet Finish Varnish 1044 for a dull rubbed effect.

Scar-not Varnish has the following characteristics. It is full in body to provide a rich varnish film that will enhance the grain of the wood and afford body enough to permit rubbing down to a high polish, where required. Scar-not dries to an exceedingly hard film, does not chip easily and does not powder white when scratched. It will not soften to print under ordinary heat of warm dishes. Scar-not is an exceedingly rugged finish, but can be rubbed to a beautiful, soft dull finish with powdered pumicestone and oil.

Velvet Finish Varnish is a finishing varnish only, intended to eliminate the necessity of hand rubbing for a dull finish. It is intended to be used either over Scar-not for a final coat or over shellac for a dull or mission effect. Velvet Finish Varnish is water-resisting and will not spot white. It works easily and satisfactorily.

To Produce an Imitation Rubbed Effect on Interior Wood Trim (Flat Drying Varnish)—Where

the architect does not care to go to the expense of a genuine rubbed varnish job, an effect can be secured by using Sherwin-Williams Velvet Finish Varnish, which so closely imitates the genuine rubbed effect that frequently experts, at first glance, mistake work done with this varnish for a genuine rubbed finish.

Velvet Finish is applied as the finishing coat over one or two coats of Sherwin-Williams Scar-not Varnish. This varnish is water-resisting and will not spot white. A highly satisfactory job of finishing can easily be secured with Velvet Finish Varnish. This varnish does not show any laps or brush marks, as is the case with many varnishes on the market which were designed to sell in competition with this famous Sherwin-Williams product.

Even where Scar-not Varnish is specified to be rubbed in the final coat, it is advisable to use Sherwin-Williams Velvet Finish Varnish on any finely carved sections of wood, as it is difficult for the finisher to get into all of the tiny crevices when rubbing down a gloss varnish used on carved woodwork.

A Few Things to Watch in the Application of Varnish—When varnishing is being done and while the varnish is drying, the premises should be kept as free from dust as possible.

No varnishing should be done in a room in which the temperature is below 70 degrees Fahrenheit, or the resulting finish may appear to be full of specks. This action of the varnish is called "pitting."

Varnish should always be stored in a warm place. If applied when cold, the resulting finish may be the same as when varnish is applied in a cold room. Varnish takes on a "specky" appearance and these tiny specks are plainly visible in the finished surface. When a varnish is in this condition, it is said to be "chilled" and should be placed in a warm room, until the temperature of the varnish is approximately that of the room, when the varnish will again return to normal condition.

Drafts in rooms in which varnish is drying, many times cause the varnish to "pit" or "flat."

A Few Words About Stains—THE SHERWIN-WILLIAMS Co. manufactures three types of stains, namely, Oil Stains, Handcraft Stains (Spirit Penetrating) and Acid Stains. Each type of stain has its own definite mission.

Specification No. 52

New Interior Open Grain Woodwork (Stained and Varnished Finish)

All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork, which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

Apply one coat of Sherwin-Williams Stain in the shade selected by the architect. After sufficient time has been allowed for drying, one coat of Sherwin-Williams Paste Filler, in the color selected by the architect, shall be applied, and before the filler has become hard the surface shall be wiped off across the grain with burlap or excelsior. Twenty-four hours shall be allowed for drying, after which a thin coat of Sherwin-Williams Marvelac, or pure shellac, shall be applied, and lightly sanded when dry. Two coats of Sherwin-Williams Scar-not Varnish shall then be applied. Sufficient time for drying shall be allowed between coats.

(For a dull finish: The last coat of varnish, when thoroughly hard, shall be rubbed to a dull finish with powdered pumice stone and oil. Or one coat of Sherwin-Williams Velvet Finish No. 1044 shall be used in place of the final coat of Scar-not Varnish for producing an imitation rubbed effect.)

FINISHING OF INTERIOR WOOD TRIM (Continued)

Note: Silver Gray Stain is not recommended for use over woods other than light toned woods such as white oak, white birch and maple. Pure white shellac, only, should be used as a sealing coat over Silver Gray Stain.

Specification No. 53**New Interior Close Grain Woodwork (Stained and Varnished Finish)**

See Opex Lacquer Specification No. 53-A.

All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork, which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

One coat of Sherwin-Williams Stain in the shade selected by the architect shall be applied. When dry apply one very thin or wash coat of pure white shellac or Sherwin-Williams Marvelac and sand lightly when dry with No. 0 sandpaper. Two coats of Sherwin-Williams Scar-not Varnish shall then be applied. Sufficient time for thorough drying shall be allowed and the surface sanded between coats with No. 00 sandpaper.

(For a dull finish: The surface shall be rubbed, when hard, with powdered pumice stone and oil to a dull finish. Or an imitation rubbed effect can be obtained by substituting Sherwin-Williams Velvet Finish No. 1044 for the final coat of Scar-not Finish.)

Specification No. 54**New Interior Open Grain Woodwork (Natural Varnished Finish)**

See Opex Lacquer Specification No. 53-A.

All woodwork shall be dry, clean and smooth, before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork, which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

One coat of Sherwin-Williams Transparent Paste Filler shall be applied, but before the filler has become hard, shall be wiped off across the grain with burlap or excelsior. After allowing forty-eight hours for the filler to dry, the surface shall be sanded smooth with No. 0 sandpaper. One coat of Sherwin-Williams Scar-not Varnish, thinned with one pint pure turpentine to each gallon, shall then be applied. A second and third coat of the same varnish shall also be applied in the consistency supplied by the manufacturer, allowing sufficient time for thorough drying and sanding lightly with No. 00 sandpaper between coats.

(For a dull finish: The surface, when thoroughly hard, shall be rubbed with powdered pumice stone and oil or water to a dull finish. Or an imitation rubbed effect may be obtained by substituting Sherwin-Williams Velvet Finish Varnish No. 1044 for the final coat of Scar-not Varnish.)

Specification No. 55**New Interior Close Grain Woodwork (Natural Varnished Finish)**

See Opex Lacquer Specification No. 53-A.

All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

Three coats of Sherwin-Williams Scar-not Varnish shall be applied. The first coat shall be thinned in proportion of one pint of pure turpentine to each gallon of varnish. The second and third coats shall be applied as the material comes from the original container. Sufficient time for thorough drying shall be allowed and the surface shall be lightly sanded with No. 00 sandpaper, between coats.

(For a dull finish: The surface, when sufficiently hard, shall be rubbed to a dull finish with powdered pumice stone and oil or water. Or an imitation rubbed effect finish can be obtained by substituting Sherwin-Williams Velvet Finish Varnish No. 1044 for the final coat of Scar-not.)

Specification No. 56**New Interior Open Grain Woodwork (Stained and Waxed Finish)**

All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and

other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

A coat of Sherwin-Williams Stain, in the shade selected by the architect, shall be applied. When the surface is sufficiently dry, one coat of Sherwin-Williams Paste Wood Filler, in the color selected by the architect, shall be applied, but before the filler is hard, the surface shall be wiped off across the grain with burlap or excelsior (where mission effect is desired, paste filler coats may be omitted). One coat of Sherwin-Williams Marvelac, or pure shellac, shall be applied, which when sufficiently dry shall be sanded lightly with No. 00 sandpaper. Two coats of Sherwin-Williams Prepared Wax shall then be applied, wiping off the surplus wax and bringing the surface to a high, hard polish by brisk rubbing.

Specification No. 57**New Interior Close Grain Woodwork (Stained and Waxed Finish)**

All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable. If any defects are found in the woodwork which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied.

One coat of Sherwin-Williams Stain, in the shade selected by the architect, shall be applied. When dry, one thin coat of Sherwin-Williams Marvelac, or pure shellac, shall be applied, which when dry shall be lightly sanded with No. 00 sandpaper. Two coats of Sherwin-Williams Prepared Wax shall then be applied, wiping off the surplus wax from the surface and bringing same to a high, hard polish by brisk rubbing.

Specification No. 58**Old Dutch Enamel Finish on Interior Wood Trim****New Interior Wood Trim—**

Discussion—Old Dutch Enamel is an enamel of the long oil type, manufactured after formulae similar to those used by the most famous of Dutch enamel makers, with certain improvements which over sixty years' experience in enamel making has enabled us to accomplish. It is impossible to obtain an enamel of better quality than Old Dutch Enamel or which will give more satisfactory results. It is very white, has a splendid gloss and is so full in body that very satisfactory results can be obtained with one coat of Old Dutch Enamel on the usual number of undercoats.

Old Dutch Enamel is made in the popular tints of Ivory and French Gray. Should an architect desire to secure some other tint, this can easily be done by the painting contractor or decorator, by tinting Old Dutch Enamel with Sherwin-Williams First Quality Oil Colors, or in the case of very delicate tints, Sherwin-Williams Quick Drying Colors Ground in Japan can be used. In tinting, the color should be broken up in a small amount of Old Dutch Enamel which, after thorough mixing, should be added to the rest of the enamel, a little at a time, until the desired tint is obtained. Where the enamel is tinted, the undercoater should likewise be tinted to a similar color.

Probably the most important feature to watch in an enamel job is the building up of the undercoating. Each coat of enamel undercoater, except the last, should be carefully sanded to a smooth surface with No. 0 sandpaper. Nothing coarser than No. 0000 sandpaper should be used on the final undercoat, as a very fine scratch is noticeable in subsequent enamel coats in high class enamel work. The enamel may then be flowed on as specified below.

See Color Samples on S-W Page 9.

Specification—Before proceeding with the work, the contractor shall make sure that the surface to be finished is perfectly dry and free from dust and dirt.

The first coat shall be Sherwin-Williams XXX Enamel

FINISHING OF INTERIOR WOOD TRIM (Continued)

Undercoater thinned (for porous soft wood) with one quart pure raw linseed oil and $\frac{1}{2}$ pint pure turpentine to the gallon. (For hard woods thin with one pint pure turpentine and one pint pure raw linseed oil to the gallon of undercoater.) When dry sand thoroughly with No. 0 sandpaper.

For the second coat (on all woods) apply Sherwin-Williams XXX Enamel Undercoater thinned with one pint pure turpentine to the gallon. When dry sand with No. 0 sandpaper. (Note: Where lead and oil primer has been used, the second coat should be thinned with $\frac{1}{2}$ pint pure turpentine and $\frac{1}{2}$ pint pure raw linseed oil to the gallon.)

For the third coat apply Sherwin-Williams XXX Enamel Undercoater thinned with one pint pure turpentine to the gallon. When dry, sand carefully to smooth surface with No. 0000 sandpaper.

The fourth coat should consist of equal parts Sherwin-Williams Old Dutch Enamel and Sherwin-Williams XXX Enamel Undercoater thinned with one pint pure turpentine to the gallon of the mixture. When dry, sand lightly with No. 0000 sandpaper.

The fifth coat should be Sherwin-Williams Old Dutch Enamel applied in the consistency supplied in the package. (Rubbed Finish: Where desired, the final coat of Old Dutch Enamel, when sufficiently hard, shall be rubbed to a dull finish with powdered pumice stone and water.)

Where the architect does not care to go to the expense of rubbing the final coat, Old Dutch Enamel, Dull Finish can be substituted for the fifth coat as specified above.

Note 1: On open-grain woods, such as Oak, Walnut and Chestnut, the first coat of the above specification should be changed so as to call for one coat Sherwin-Williams Paste Wood Filler, Transparent, wiping off surplus filler before same has become set on the surface. Then proceed with specifications as above.

Note 2: Where expense is a consideration the third coat as specified above may be omitted.

Previously Finished Interior Wood Trim—

Specification—The surface to be finished shall be thoroughly cleaned, preferably with Sherwin-Williams Flaxoap (pure linseed oil soap) and warm water. When dry, sand thoroughly with No. 0 sandpaper to remove any gloss which may be on the old finish.

For the first coat apply Sherwin-Williams XXX Enamel Undercoater mixed with one quart of Sherwin-Williams Old Dutch Enamel and one pint pure turpentine to the gallon of undercoater.

The second coat should be Sherwin-Williams XXX Enamel Undercoater and Sherwin-Williams Old Dutch Enamel mixed in equal parts and the mixture reduced with one pint pure turpentine to the gallon. When dry sand lightly with No. 0000 sandpaper.

Third coat to be Sherwin-Williams Old Dutch Enamel (gloss or dull) in consistency supplied in the package.

Note: Where finish is badly cracked or chipped remove down to the bare wood with Sherwin-Williams Taxite (Paint and Varnish Remover) and after cleaning the surface thoroughly, proceed as for new wood.

Specification No. 59

Enamelastic—Enamel Finish on Interior Trim

Discussion—Sherwin-Williams Enamelastic is an easy working, good flowing interior enamel of the oil type. Its use is recommended where the more expensive Old Dutch Enamel system cannot be used.

Best results are obtained when enamels are applied over a tight surface. Sherwin-Williams XXX Enamel Undercoater has been especially developed to produce the desired tightness. It has unusual flow and sands remarkably easy although it is exceptionally tough.

New Interior Wood Trim—

Specification—Before proceeding with the work, the contractor shall make sure that the surface to be finished is perfectly dry and free from dust and dirt. Each coat must be thoroughly dry before a succeeding coat is applied.

For the first coat apply Sherwin-Williams XXX Enamel Undercoater reduced with one quart pure raw linseed oil and $\frac{1}{2}$ pint of pure turpentine to the gallon on soft woods. (On hard woods reduce each gallon with one pint pure turpentine and one pint pure raw linseed oil.)

Second Coat—Apply Sherwin-Williams XXX Enamel Undercoater reduced with one pint pure turpentine. (In the event that a lead and oil primer has been used reduce the undercoater with $\frac{1}{2}$ pint pure turpentine and $\frac{1}{2}$ pint pure raw linseed oil to the gallon.)

Third Coat—Apply Sherwin-Williams Split-Coat or a split coat made up of equal parts Sherwin-Williams Enamelastic and Sherwin Williams XXX Enamel Undercoater, reducing each gallon of the mixture with one pint pure turpentine.

Fourth Coat—Apply Sherwin-Williams Enamelastic Gloss or Satin Finish as it comes in the package.

Note 1: Where economy permits only three coats, omit the second coat above.

Note 2: Where special shades are desired, Sherwin-Williams First Quality Oil Colors should be used to tint to the shade approved by the architect.

Previously Finished Interior Wood Trim—

Specification—The surface to be finished shall be thoroughly cleaned, preferably with Sherwin-Williams Flaxoap (pure linseed oil soap) and warm water. When dry, sand thoroughly to remove any gloss which may be on the old finish.

First Coat—Apply Sherwin-Williams Split-Coat or a split coat made up of equal parts of Sherwin-Williams XXX Enamel Undercoater and Sherwin-Williams Enamelastic reduced with one pint pure turpentine to the gallon of the mixture.

Second Coat—Apply Sherwin-Williams Enamelastic, Gloss or Stain Finish in the consistency in which it comes in the package.

On surfaces in bad condition, all loose paint should be scraped off and the surface sanded thoroughly. Bare spots should be primed with Sherwin-Williams XXX Enamel Undercoater reduced with one quart pure raw linseed oil and $\frac{1}{2}$ pint pure turpentine for soft, porous woods or one pint pure turpentine and one pint pure raw linseed oil to the gallon for hard woods. Then proceed as above. When surface is badly cracked, the paint should be removed with Sherwin-Williams Taxite, a paint and varnish remover—then follow specifications given for new work.

Specification No. 59X

Enamelo—Enamel Finish on Interior Trim

Discussion—Sherwin-Williams Enamel is intended for interior use where time will not permit the use of the slower drying Enamelastic which is a full oil enamel. Enamelo dries dust free in one and one-half hours, hard in six to eight hours and very hard in twenty-four hours.

Although it is a varnish enamel it has easy working, flowing, fullness and covering which qualities are quite unusual in a varnish enamel.

New Interior Wood Trim—

Specification—Before proceeding with the work, the contractor shall make sure that the surface to be finished is perfectly dry and free from dust and dirt. Each coat must be thoroughly dry before a succeeding coat is applied.

First Coat—Apply Sherwin-Williams XXX Enamel Undercoater reduced with one quart raw linseed oil and $\frac{1}{2}$ pint pure turpentine to the gallon on soft, porous woods. On hard woods reduce each gallon with one pint pure turpentine and one pint pure raw linseed oil.

Second Coat—Apply Sherwin-Williams XXX Enamel Undercoater reduced with one pint pure turpentine to the gallon. (In the event a lead and oil primer has been used reduce the undercoater with $\frac{1}{2}$ pint pure turpentine and $\frac{1}{2}$ pint pure raw linseed oil to the gallon.)

Third Coat—Apply equal parts Sherwin-Williams XXX Enamel Undercoater and Sherwin-Williams Enamelo, reducing each gallon of the mixture with one pint pure turpentine.

Fourth Coat—Apply Sherwin-Williams Enamelo as it comes in the package.

Note 1: Where economy is desirable, omit the second coat and a very satisfactory three-coat job is obtained.

Note 2: Where special shades are desired, Sherwin-Williams First Quality Oil Colors should be used to tint to the shade approved by the architect.

Previously Finished Interior Wood Trim—

Specification—The surface to be finished shall be thoroughly cleaned, preferably with Sherwin-Williams Flaxoap (pure linseed oil soap) and warm water. When dry, sand thoroughly to remove any gloss which may be on the old finish.

First Coat—Apply Sherwin-Williams Split-Coat or a split coat made up of equal parts of Sherwin-Williams XXX Enamel Undercoater and Sherwin-Williams Enamelo reduced with one pint pure turpentine to the gallon of the mixture.

Second Coat—Apply Sherwin-Williams Enamelo in the consistency in which it comes in the package.

FINISHING OF INTERIOR WOOD TRIM (Continued)

On surfaces in bad condition, all loose paint should be scraped off and the surface sanded thoroughly. Bare spots should be primed with Sherwin-Williams XXX Enamel Undercoater reduced with one quart pure raw linseed oil and 1/2 pint pure turpentine to the gallon on hard woods. Then proceed as above.

When surface is badly cracked, the paint should be removed with Sherwin-Williams Taxite, a paint and varnish remover. Then follow specifications given for new work.

*Specification No. 59Y***Semi-Lustre Finish on Interior Trim**

Discussion—Sherwin-Williams Semi-Lustre is an economical finish for interior trim and gives excellent results where the more expensive enamel finish isn't practical. It is easy working and flows out to a soft velvety finish.

New Interior Wood Trim

Specification—Before proceeding with the work the con-

tractor shall make sure that the surface to be finished is perfectly dry before a succeeding coat is applied.

First Coat—Apply Sherwin-Williams Semi-Lustre, reducing each gallon with one quart pure turpentine.

Second Coat—Apply Sherwin-Williams Semi-Lustre just as it comes from the package.

Third Coat (if desired)—Apply Sherwin-Williams Semi-Lustre as it comes from the package.

Previously Finished Interior Trim

Specification—The surface to be finished shall be thoroughly cleaned, preferably with Sherwin-Williams Flaxoap (pure linseed oil soap) and warm water. When dry, sand thoroughly to remove any gloss which may be on the old finish.

First Coat—Apply Sherwin-Williams Semi-Lustre as it comes from the package.

Second Coat (if desired)—Apply Sherwin-Williams Semi-Lustre as it comes from the package.

Notes: If any thinning is necessary use pure turpentine only. If any special shades are desired use Sherwin-Williams First Quality Oil Colors for tinting.

Allow sufficient time for drying between coats. Twenty-four hours is usually sufficient.

MISCELLANEOUS SPECIFICATIONS

*Specification No. 60***Priming Galvanized Iron Surfaces**

Discussion—Palm oil used in metal galvanizing processes many times affects paint applied over galvanized surfaces, with the result that the paint will peel or flake off and present a highly unsatisfactory finish. Architects recognize the painting of galvanized metal as a real problem and will be glad to know of Sherwin-Williams Galvanized Iron Primer for the priming of surfaces of this type to insure good results.

Specification—All galvanized metal surfaces, whether interior or exterior, shall be primed with one coat of Sherwin-Williams Galvanized Iron Primer. Care shall be exercised by the contractor before painting, to insure the fact that the surfaces which are to be painted are in good condition—all dirt, rust, grease, acid or rosin being removed before priming. The best way to clean the surface is by washing thoroughly with a solution of copper acetate consisting of a solution of about six ounces to one gallon of water.

(Subsequent coats will depend entirely upon the architect's own selection of finish. The surface can either be painted with a regular lead, oil and zinc paint, flat wall finish or enamel finish.)

*Specification No. 61***Painting Radiators**

See Opex Lacquer Specification No. 62-A

Discussion—Tests made by the American Society of Heating and Ventilating Engineers and also by the Paint Manufacturers Association of the United States indicate that paints made from bronze powders retard the radiation of heat approximately 25%, while paints and enamels made from zinc oxide or lithopone do not appreciably affect radiation one way or the other.

Recent tests prove that the use of the lighter tints of Sherwin-Williams Flat-Tone Wall Finish will produce a highly satisfactory finish on radiators and will not affect the efficiency of the radiation. This paint tends to bake to a hard film on radiator surfaces and tests made by the Paint Manufacturers Association of the United States upon radiators in their laboratories

indicate that such a finish has a life of as high as nine to ten years without showing defects.

Regardless of what types of paint are used in painting radiators, there is bound to be a slight change in color. White Damar Enamels will yellow slightly, while flat finishes, like Flat-Tone and colored enamels, will likewise change color slightly.

This is a condition for which a remedy has not been found up to the present, but the results all in all are highly satisfactory.

Specification—Before applying paint clean off dust, dirt and rust from radiators by wire brushing. Also remove any grease which may be present. Radiators must not be painted while they are hot. Allow paint to dry thoroughly before turning on heat.

Where a white finish is desired on radiators specify two coats of Sherwin-Williams Flat-Rite and one coat of Sherwin-Williams Enameloid.

For a colored enamel finish on radiators, specify two coats of Sherwin-Williams Flat-Rite and one coat of Sherwin-Williams Enameloid in the color selected.

For a flat finish on radiators specify two coats of Sherwin-Williams Flat-Tone in the color selected.

Oil Colors—The selection of the highest grade of oil colors for tinting purposes is really an important matter. Inferior colors, not fast to light, have ruined many painting jobs which otherwise were perfect. Specify Sherwin-Williams First Quality Colors Ground in Oil. These colors are fast to light and are ground in strictly pure refined linseed oil.

*Specification No. 62***Metal Trim (Enameled Finish) to Be Finished on Job**

See Opex Lacquer Specification No. 62-A

All metal trim to be finished on the job shall receive a coat of Sherwin-Williams Metal Trim Primer before leaving the shop. After the trim has been installed it shall be thoroughly cleaned from all dust, dirt, grease, etc., and sanded lightly with No. 00 sandpaper, after which two coats of Sherwin-Williams Enameloid in the color selected by the architect shall be applied. When the first coat of enamel is thoroughly dry it shall be lightly sanded with No. 00 sandpaper before the second coat is applied.

Note: Where an especially high grade enamel finish is desired in light tints or white, use the standard Sherwin-Williams Old Dutch Enamel specification No. 58 for the finishing of wood trim.

OPEX ARCHITECTURAL SPECIFICATIONS

Foreword

Positive proof that architects are convinced of the desirable properties of Opex Architectural finishes is found in the following list of imposing buildings which are being finished or have been finished in 1930 with Opex:

Michigan Square Building, Chicago, Ill.
Buckingham Building, Chicago, Ill.
Board of Trade Building, Chicago, Ill.
No. 1 LaSalle Building, Chicago, Ill.
Midland Bank Building, Cleveland, Ohio
Alamo Bank Building, San Antonio, Tex.
Aurora Apartment Hotel, San Antonio, Tex.
450 Sutter Building, San Francisco, Calif.
Paducah Bank Building, Paducah, Tex.
LaSalle-Wacker Building, Chicago, Ill.

The following products make up this Opex line:

Opex Brushing Interior Clear Gloss
Opex Brushing Floor Clear Gloss
Opex Spraying Interior Clear Velvet
Opex Brushing Interior Clear Velvet
Opex Spraying Floor Clear Gloss
Opex Sealer Binder Clear

Brush Application

Flow Opex Interior Brushing Lacquers on with a full brush. If it is necessary to go back into a portion that has started to set up, be sure that a partially full brush is used, thus giving better reflow and eliminating any tendencies towards "piling up." If any thinning is necessary, use Opex Brushing Lacquer Thinner only.

Spray Application

Use eight pounds on the pressure tank, and forty pounds on the line. If lower pressure or a cup gun is used, some thinning may be necessary. On new work, this reduction should not exceed twenty-five per cent, using Opex Thinner No. 10.

Specification No. 21-A

New Floors—Open Grain—Natural Finish

The floors shall be perfectly smooth before any lacquer is applied, and shall be thoroughly cleaned of all dust, dirt, stains, etc. The floor shall then be filled with Sherwin-Williams Paste Wood Filler Transparent which before becoming hard shall be wiped off across the grain of the wood with burlap or excelsior. After allowing twenty-four hours for drying, the surface shall be sanded to a smooth finish with No. 1/2 Sandpaper. Apply a wash coat of Opex Sealer Binder Clear, reducing each gallon with two quarts of denatured alcohol. Let dry two hours; sand lightly with 0000 sandpaper. Apply one coat Opex Floor Clear Gloss without reduction. Let dry two hours where sprayed, three hours where brushed, before putting into service.

Specification No. 22-A

New Hardwood Floors—Open Grain—Stained Finish

The floor shall be scraped and sandpapered smooth and perfectly dry before any finish shall be applied. Thoroughly sweep out all shavings, dust and dirt. Remove any stains or discolorations by bleaching or scraping.

Apply one coat of Sherwin-Williams Acid Stain in the color selected by the architect. Allow to penetrate and wipe off surplus stain before drying. Let dry overnight before applying further finishing coats.

Note: This method is required where dark effects are desired and also for close-grain woods which cannot be filled.

Open-grain woods can be frequently modified sufficiently in tone through the use of Sherwin-Williams Paste Wood Fillers in the dark colors. Paste Wood Fillers come in paste form and are to be thinned with benzine to the consistency of thick cream for brushing. Brush over the surface of the wood and let stand until partly set, indicated by partial flattening out of the wet gloss. Then wipe across the grain of the wood with burlap or excelsior, removing all excess filler. Wipe clean with a soft cloth. Allow twenty-four hours for drying before applying further finishing coats. Apply a wash coat of Opex Sealer Binder Clear, reducing each gallon with two quarts of denatured alcohol. Let dry two hours; sand lightly with 0000 sandpaper. Apply one coat Opex Floor Clear Gloss without reduction. Let dry two hours where sprayed, three hours where brushed, before putting into service.

Specification No. 23-A

New Hardwood Floors—Close Grain—Stained Finish

The floors shall be perfectly smooth before any finish is applied and shall be thoroughly cleaned of all dust, dirt, stains, etc. One coat of Sherwin-Williams Acid Stain in the color selected by the architect shall then be applied. Allow to penetrate and wipe off surplus stain before drying. Let dry overnight before applying further finishing coats.

Apply a wash coat of Opex Sealer Binder Clear, reducing each gallon with two quarts of alcohol. Let dry two hours, sand lightly with 0000 sandpaper. Apply one coat Opex Floor Clear Gloss without reduction. Let dry two hours where sprayed, three hours where brushed before putting into service.

Specification No. 27-A

New Softwood Floors—Stained Finish

The floors shall be perfectly smooth before any finish is applied and shall be thoroughly cleaned of all dust, dirt, stains, etc. A coat of Sherwin-Williams Acid Stain in the color selected by the architect shall then be applied. Let dry overnight before applying further finishing coats.

Apply a wash coat of Opex Sealer Binder Clear, reducing each gallon with two quarts of alcohol. Let dry two hours, sand lightly with 0000 sandpaper. Apply one coat Opex Floor Clear Gloss without reduction. Let dry two hours where sprayed, three hours where brushed before putting into service.

Specification No. 28-A

New Softwood Floors—Enamel Finish

The floors shall be thoroughly dry and free from all dust, dirt, grease, etc., before any finish is applied.

Apply one coat of Sherwin-Williams White Oil Primer No. 12 followed by two coats of Sherwin-Williams Opex Lacquer Enamel of the color chosen by the architect.

Allow one hour for drying between coats except for the primer which should dry twelve hours.

Specification No. 53-A

New Interior Woodwork—Stained and Natural Finish

All woodwork shall be dry, clean and smooth before any finishing materials are applied. All nailholes, cuts, cracks and other defects shall be treated so as to render them unnoticeable by filling with a putty made of whiting, white lead, glue and water. If any defects are found in the woodwork which cannot be corrected so as to insure a perfect finish, the contractor shall notify the architect before any finishing materials are applied. On open-grain woods such as walnut and mahogany, stain and fill; let dry forty-eight hours. On close-grain woods such as birch or gum, or for open pore effect on open-grain woods, use any S-W Stain. (On soft woods, Oil Stain is advisable.) Let dry twenty-four hours. Apply a thin coat of Opex Sealer Binder Clear without reduction. Let dry at least two hours, sand lightly with 0000 sandpaper, and apply one coat of Opex Interior Clear Gloss or Velvet. For a fuller finish, a second coat may be applied after two hours. For a gloss-rubbed job, let dry two hours. Then apply a second coat of the gloss. As soon as the film is dried hard, it may be rubbed. Under normal drying conditions, this may be done in eight hours after the last coat of lacquer has been applied. However, twenty-four hours is recommended.

Note: Sherwin-Williams Acid Stain should be applied as follows:

Sponge the wood with clear, cold water and allow to dry. Sandpaper smooth and apply one full coat of Sherwin-Williams Acid Stain, first testing the strength of the stain for depth of color and shade on sample of same kind of woodwork. Let dry and sandpaper carefully to a smooth surface with No. 00 sandpaper. If necessary, restain with Acid Stain reduced 100% with water. Let dry and sandpaper very lightly, if necessary, for a smooth finish with No. 0000 sandpaper. Apply Sherwin-Williams Paste Wood Filler in the shade required for the stain effect. Let stand for a few minutes until partly set, indicated by partial flattening out of the wet gloss of the material. Wipe off surplus filler by wiping across the grain of the wood. Wipe clean with a soft cloth. Clean out all corners and crevices carefully with a pointed wood stick and cloth. Allow twenty-four hours for drying.

Specification No. 59-A

New Interior Wood Trim—Enamel Finish

The contractor shall make sure that the surface to be finished is perfectly dry and free from dust and dirt.

The surface shall then be sanded down to a smooth surface, after which apply one coat of Sherwin-Williams Opex Sanding Sealer No. 98. After at least two hours dry, sand lightly and follow with two coats of Sherwin-Williams Opex Enamel, thinned 75% with Opex Thinner No. 10 in the shade selected by the architect, allowing one hour for drying between coats.

Note: On open grained woods such as oak, chestnut and walnut, the specifications should call for a coat of Sherwin-Williams Opex Wood Filler White No. 611 between coats of No. 98 Sealer and the finishing enamel.

SEIDLITZ PAINT & VARNISH COMPANY

Manufacturers of Paints, Varnishes, Enamels and Lacquers

MAIN OFFICE AND FACTORY

18th and Garfield Streets, KANSAS CITY, MO.

TULSA, OKLA., 622 South Main Street
OKLAHOMA CITY, OKLA., 422 North Hudson Street

SAN ANTONIO, TEX., 102 West Commerce Street
WICHITA, KAN., 1422 East Douglas Street

Seidlitz Products

Manufacturers of a complete line of PAINTS, VARNISHES, STAINS, FILLERS, UNDERCOATERS and LACQUERS including:

- Long Oil Spar Varnish.
- Long Oil Quick Drying Floor Varnish.
- Long Oil Finishing Varnish.
- Long Oil Flat Varnish.
- 4-Hour Floor and Finishing Varnish.
- Long Oil White Enamel.
- Long Oil Undercoat.
- Seid-Lac, 4-hour Enamel.
- Half Tone, Subdued Gloss Finish.
- Oiltone Flat Wall Finish.
- Wall Sealing Primer
- Litho Lite Mill-white.
- B Lacquer (Brushing Lacquer).
- Penetrating Stains.
- Paste Fillers.

Specification Manual

We will be glad to send you our Specification Manual, giving specifications for Seidlitz Long Oil Paint and Varnish Products, for use on walls, woodwork, floors, etc. Made to fit standard specification files.

Should information be desired on any wood finishing problem we would welcome the opportunity to be of service. Address letters to main office—18th and Garfield Streets, Kansas City, Mo.

Seidlitz Long Oil Quick Drying Floor Varnish

The very highest type of floor varnish that it is possible to produce, using nothing but pure vegetable oils, hard fossil gum and thinners. Being long in oil it is very lasting and wear resisting. Has a satisfying richness and depth. Stands up longest under the pounding, grinding wear that floors receive.

Specify same as for any first class floor varnish.

Seidlitz Long Oil White Enamel

A heavy snow white enamel which produces an almost porcelainlike finish. Made of the finest grade of French process zinc oxide, especially refined and treated linseed oil, the palest possible drying agents, pure turpentine, and nothing else. There is no varnish gum of any kind used in producing it; this, together with the treatment we give the oil, leaves nothing to lessen its elasticity, or cause it to discolor or to become brittle with age or exposure. Neither does moisture affect its brilliance or film—hence it is equally adaptable for the finest grade of interior enameling, or for outside and exposed surfaces.

Is made in either gloss or eggshell finish, also the following colors: white, ivory, cafe au lait and gray.

Specify same as any first grade enamel.

TRADE-MARK

Original Container

Seidlitz Long Oil Undercoat

Produces a smooth, hard, opaque surface, a perfect foundation for all enamel work. Enamel does not perish into this hard drying undercoat but is held on the surface where you can appreciate its beauty, richness and brilliance. Has great hiding power.

Specify same as for any first grade enamel undercoat.

Seidlitz Half Tone

A subdued gloss paint made on an oil base for interior walls and woodwork where a rich half gloss is desired. Has exceptional hiding or covering power. Washes readily. Produces a much richer appearing wall than is possible with any flat paint. Recommended for hotels, hospitals, public buildings, etc.

Comes in white and eight beautiful tints.

For specifications see Seidlitz Specification Manual.

Seidlitz Oiltone Flat Wall Finish

The finest quality of wall finish that can be produced. Dries with a rich velvety sheen that is washable. Covers a maximum number of square feet per gallon. Made in white and tints.

For specifications see Seidlitz Specification Manual.

Seidlitz Wall Sealing Primer

A pigmented, special oil base primer and first coater that will be found as nearly perfect as possible to manufacture for the priming or first coating of new plaster walls. One coat of Wall Sealing Primer and one coat of Oiltone Flat Wall Finish will produce the equal of the average three-coat job.

Specify same as any first grade wall size.

Seidlitz Litho Lite Mill-white

Stays white and reflects light. A satin-smooth, snow white interior finish of exceptional luster, made of treated oils, which, when combined with the pigment, produce a true white that is permanent and will not turn yellow. Made particularly for walls and woodwork. It can be either brushed or sprayed. Its great spreading capacity, its durability and ease of cleansing make Litho Lite economical to apply and to maintain. Recommended for factories, schools, public buildings, bakeries, laundries, institutions, residences, office buildings and hotels.

Specify same as for any first grade mill-white.

Seidlitz Long Oil Surfer

An elastic undercoat, primer or filler for wood, metal, plaster, galvanized iron, glass, etc. It prevents or stops checking, alligating, or peeling of paints, varnishes, enamels, etc. Will increase the elasticity of any paint, varnish, or enamel either for inside or outside use.

For specifications see Seidlitz Specification Manual.

Varnishes, Paints, Enamels, Lacquers and Allied Products for All Architectural Requirements

These Standard Products embody the most advanced skill and knowledge in the manufacture of paints, varnishes and enamels, based on over 60 years' experience.

The architectural profession can specify their use with complete confidence in the performance under normal or exceptional conditions.

Satinette White Enamel

The world-wide reputation which Satinette enjoys is convincing proof of its quality and character as a white enamel of ultra-durability and economy in use.

Gloss White—Adaptable for interior or exterior use. It may also be rubbed with pumicestone and water for semigloss finish.

Flat White—For interior use requiring a dead white enamel finish.

White Rubbed Effect—For interior use where a rubbed effect is desired, without the labor and expense of hand rubbing.

Satinette Undercoat—For preparatory coats on woodwork, to be finished with Satinette Enamel.

Satinette Cement Undercoat—For preparatory coats on cement, concrete or plaster.

Standard Kleartone Oil and Acid Stains

These stains are safe and economical to use. They produce artistic and lasting effects. Kleartone Oil Stains penetrate as deeply as acid stains, but require no sponging of the wood before use, or sandpapering after use. Kleartone Acid Stains are provided to produce certain effects not possible to obtain with oil stains.

Standard Elastica Varnishes

While there are other high grade varnishes available, there are none which provide more lasting results, or give greater satisfaction in use than Elastica Varnishes.

Elastica Floor Finish—Combines hard drying properties, without sacrificing elasticity or durability; protects floors and linoleum under the most severe wear and frequent washing; does not mar, scratch white or spot; dries dust free in 4 to 6 hours and hardens overnight; may be rubbed in 48 hours.

Elastica Interior Varnish—A varnish of extreme pale-ness and durability for interior woodwork. It produces a permanent gloss finish, dries dust free in 4 to 6 hours, will rub to a dull finish in 3 to 4 days.

Elastica Spar Varnish—This varnish is manufactured to meet the needs of those requiring an ultra-durable waterproof spar varnish for exterior or interior use of any kind. It is resistant to hot, cold, fresh or salt water. Dries free from dust in from 5 to 6 hours and hardens overnight with a brilliant gloss. It should not be applied over shellac, liquid fillers or patent first coats.

Elastica Dull Finish—For final coat work on floors and interior woodwork where a dull or flat effect is desired. It is durable and waterproof, and creates an effect similar to that produced by wax or by rubbing a gloss varnish.

Elastica Seat Varnish—A very hard drying varnish for church and school seats, porch furniture, chairs, etc. Dries free from dust in from 2 to 3 hours, and hard overnight. May be rubbed in from 3 to 4 days.

S.V.W. Klean-Kote Wall Finish (Medium Gloss)

Interior wall and ceiling surfaces of hotels, hospitals, theaters and other institutions and large or small buildings require the type of decorative protection afforded through the use of S.V.W. Klean-Kote.

A medium gloss finish. Its smooth even film insures sani-

tary surroundings, as dirt, grease, smoke and grime cannot successfully adhere to its surface. It is easily and simply cleaned—washing not affecting the smoothness or color of the film.

It will serve equally well on plaster, wood, metal, wall board, canvas or burlap. The decorative and harmonious colors are fast and unaffected by fumes or moisture. Two coats will provide ample covering under all average conditions. Its spreading and covering qualities insure economy from its use.

S.V.W. Flattine Washable Wall Paint

A non-glossy oil paint for interior decoration. Can be used with entire safety on plaster, wood, metal, concrete and other surfaces. A washable, sanitary finish insuring durable and permanent results.

In addition to the 16 soft tone colors, the possibilities for distinctive decorative finishes through the use of the Mottle Effect System invites consideration. Because S.V.W. Flattine is an oil flat, containing no varnish, it spreads easily and dries without laps or brush marks.

S.V.W. Pigmented Wall Sealer

A first or priming coat for new plaster walls and ceilings, preparatory to using S.V.W. Flattine Washable Wall Paint or S.V.W. Klean-Kote. It is also suitable for priming wall board.

Its advantages are that it overcomes the alkalinity of the plaster, prevents suction and provides an excellent foundation for the finishing coats. It may be mixed with a small quantity of the color of the finishing coats, or tinted with a good grade of colors in oil.

Elastica Metal Trim Enamel

Interior Enamel—A metal trim enamel developed especially for all interior metal surfaces—doors, door bucks, windows, radiators, base and stairs. A semigloss, washable, durable finish in colors to meet interior decoration needs.

Exterior Enamel—Recommended for use where extreme exposure to water, sun and other elements is met with—outside metal trim, doors, frames, windows, window sills.

Two coats of Elastica Metal Trim Enamel should be used for finest results.

It should always be applied over a dependable shop coat metal primer, of known character, such as S.V.W.A.D. Metal Primer.

Supplied in various shades of grays, greens, browns, etc., special colors and shades will be provided when the quantity required justifies doing so.

S.V.W. All Oyl Enamel and Enamel Undercoat

Enamel—A medium grade enamel possessing valuable characteristics. Designed specially for master painter use, it has maximum covering and spreading properties. It can be worked for 5 minutes without danger of sagging in corners or on rounded surfaces. It sets dust free in 3 hours and dry for handling in 12 to 18 hours, insuring economy of time and labor through its use. Supplied in white, ivory or gray, in either gloss or rubbed effect.

Undercoat—This undercoat should be used under All Oyl Enamel to insure the best results. The dense covering pro-

vided, coupled with its easy working and leveling properties, will insure a thoroughly satisfactory two-coat finish. It sets dust free and flattens in 1½ hours, has no tendency to rope, and can be sanded in 12 hours without gumming the sandpaper.

Standard Koverflor

For inside or outside floors of wood or cement. It is a definite and dependable liquid floor covering which seals any floor surface against the destructive effects of water, oil and grease, as well as hard or severe wear. When applied over cement it does not "pit," maintaining its smooth and tilelike surface to an extraordinary degree.

Supplied in 13 appropriate floor colors and black and white, it will provide a sound and scientific floor treatment, decorative and extremely serviceable.

Clear Koverflor has all of the desirable qualities of Koverflor in colors. It should be specified wherever a varnish effect is desired, such as on hardwood floors, decks of yachts, vessels and for linoleum.

S.V.W. 4-Hour Quick-drying Finishes

Modern conditions, in many instances, require increased speed in finishing operations. To meet this demand, we have provided the following products. The architect may safely rely on the satisfactory durability as well as serviceability of S.V.W. 4-Hour Finishes.

2-2-4 Kwickwork Enamel—A durable gloss decorative enamel for general use either for inside or outside. Designed for woodwork, walls, furniture, etc., it spreads easily, has maximum covering capacity, leaves no brush marks and is extremely waterproof. Drying in 4 hours, two coats may be applied in one working day. Supplied in 24 modern colors and white and black.

4-Hour Floor Varnish—A durable, elastic, waterproof varnish of excellent body and lustric. It is thoroughly dependable for floors and linoleum. Pale in color it can be used with entire satisfaction over the finest of floors.

4-Hour Interior Varnish—Designed for interior trim and woodwork. A lustrous and durable finish which may be rubbed to a satin finish.

GENERAL INSTRUCTIONS

To achieve the fine finish and the durable results Standard Products are designed to provide, it is essential that the surface should be adequately prepared to receive the finish.

In enameling, varnishing or painting, ample light and ventilation are necessary to insure proper drying and hardening. The surface should be clean of dirt, oil, grease and moisture—the surface should be dry. Finishes should never be applied in damp, wet or freezing weather. Best results are obtained at a temperature of 70° F. Varnishes which have been chilled may be warmed by standing the container in a pan of warm water.

Application of Enamels

S.V.W. Satinette; All Oyl; 2-2-4 Kwickwork—Since the finish depends so much on the proper foundation, the undercoats should preferably be those designed for the particular enamel. Ample time for drying should be allowed between coats and each coat when dry should be sandpapered with 0 or 00 sandpaper. On new wood, all sappy places should be given a coat of pure white shellac.

After application of the proper coat or coats of undercoat, the desired number of finishing coats of either gloss, flat or rubbed effect enamel should be flowed or brushed on. If a hand rubbed effect is desired, after the enamel (gloss finish) is thoroughly dry, it may be rubbed with felt, pumicestone and water in the conventional manner.

Surfaces previously finished may be enameled over, provided the old coating is not cracked or chipped. Clean up the surface and apply one or two coats of enamel as desired. If it is necessary to remove the old finish, use Standard Klenza Paint and Varnish Remover; wash up thoroughly; permit surface to dry out; then proceed as for new work.

Application of Wall Finishes

S.V.W. Klean-Kote; S.V.W. Flattine—New plaster walls should have a priming coat of S.V.W. Pigmented Wall Sealer, to neutralize the hot spots and prevent suction. When it is dry, apply one or two coats of the wall finish as desired, allowing sufficient time between each coat for drying. Do not permit the use of cheap sizing or glue on plaster walls. Calcimine must be washed off completely and the wall surface should be thoroughly dry before recoating with an oil wall finish.

Old walls of plaster, and new or old wood or metal surfaces do not require the use of a priming coat of S.V.W. Pigmented Wall Sealer.

Application of Varnishes

Elastica Varnishes; 4-Hour Varnishes—For finest results on new work we recommend the use of three coats, the first coat to be thinned with about 1 pt. of pure spirits of turpentine to the gallon of varnish. Sandpaper lightly with 00 sandpaper between coats, after each coat is dry.

Elastica Floor Varnish should never be applied over shellac, liquid filler or patent first coaters when the service and

durability, which this varnish will provide, is desired. Open grained wood should have the grain filled with Standard Kleartone Paste Wood Filler before applying the first varnish coat. If the wood is to be stained first, follow the customary procedure in the application of stains.

Application of Stains

S.V.W. Kleartone Oil and Acid—It is important to keep in mind that the effect produced by a stain will vary somewhat, dependent on the type of wood used. A walnut stain on gumwood will have a different tone than on yellow pine. Hardwoods will also take a stain somewhat differently than soft or porous woods.

SPECIFICATIONS

For Close Grain Woods—Stain with STANDARD VARNISH WORKS' Kleartone Oil or Acid Stain (shade selected). After stain is thoroughly dry apply one coat of STANDARD VARNISH WORKS' Kleartone Sealer or Kleartone Coater, as required for shade of stain specified.

For Open Grain Woods—Stain with STANDARD VARNISH WORKS' Kleartone Oil Stain (shade selected). After stain is thoroughly dry apply one coat of STANDARD VARNISH WORKS' Kleartone Sealer or Kleartone Coater, as required for shade of stain specified.

After sealer or coater is thoroughly dry fill with STANDARD VARNISH WORKS' Kleartone Paste Wood Filler (suitable shade) to be wiped off across the grain of the wood with excelsior or burlap before the filler becomes hard.

For Open Grain Woods—Stain with STANDARD VARNISH WORKS' Kleartone Acid Stain (shade selected). After stain is thoroughly dry sandpaper with 00 sandpaper and fill with STANDARD VARNISH WORKS' Kleartone Paste Wood Filler (suitable shade) to be wiped off across the grain of the wood with excelsior or burlap before the filler becomes hard.

After 24 hours apply one coat of STANDARD VARNISH WORKS' Kleartone Sealer or Kleartone Coater, as required for shade of stain specified.

Note: In every case, after the Sealer or Coater is dry, proceed with the varnish coats as desired. For shades of stains, paste wood fillers and sealers and coaters, consult S.V.W. Kleartone Color Card furnished on request.

Application of Standard Koverflor

Two coats are recommended for finest results. On cement surfaces, thin the first coat with at least 3 pt. or 2 qt. of pure spirits of turpentine to the gallon of Koverflor. Brush in well and allow to dry at least 12 hours. Follow with second coat in body as received in container, permitting at least 24 hours for drying. On wood surfaces, thin first coat with 1 qt. of turpentine then follow foregoing directions. Never apply Koverflor over wet or damp surfaces.

New cement floors should be washed with a 10% muriatic acid solution, i.e., 90% water and 10% muriatic acid, to neutralize the free lime. Permit the solution to stand for 5 minutes, then wash up with clean water and allow the floor to dry out for at least 10 days, after which the first coat of Koverflor can be applied.

Surfaces which have been waxed or oiled should be thoroughly cleaned off prior to applying Koverflor; using a mixture of one-half turpentine and one-half benzine.

Architectural Service

THE TRUSCON LABORATORIES manufacture a complete line of waterproofings and paint coatings formulated to meet each individual requirement. The representatives of THE TRUSCON LABORATORIES are technically trained men whose duty it is to assist architects, engineers and owners in the selection of the proper material to meet their protective and decorative problems, by making a complete study of the requirement and furnishing detailed recommendations as desired and without obligation.

Truscon Bar-Ox, Inhibitive Steel Paint

A metal protective coating, embodying a scientific combination of inhibitive pigments and waterproof oils, in accordance with the most advanced principles of iron and steel protection. The oils used in Bar-Ox are especially heat-treated so as to remove all moisture and impurities which might cause pin-holes to form in the paint film. Thus, Bar-Ox produces a waterproof, elastic film which effectively insulates iron or steel surfaces from contact with moisture. Actual service records under severe exposures in damp, tropical countries, as well as in the cold of the extreme northland, have definitely proved the superiority of Bar-Ox as a weather-protective coating for metal.

Bar-Ox is furnished in black and 14 standard colors. It is suggested that the shop-coat be specified as Bar-Ox Red, No. 142, and the field-coat as either Bar-Ox Black, No. 143 or Dark Green No. 144. These colors are recommended because of their economy and also because of their contrast, which makes the job of inspection for complete field-coat coverage easier and more certain.

Specifications for Painting Structural Steel

Remove all scale, dirt and foreign matter from structural steel before any painting is done in the shop.

Covered surfaces, surfaces in contact and all parts of riveted members shall receive 1 coat of Bar-Ox (color and number) before assembling. All finished members shall receive 1 coat of Bar-Ox (color and number) before being exposed to the weather. All bolts used in erection and remaining in the structure shall be dipped in Bar-Ox. All surfaces accessible after

erection shall have all abraded spots touched up with Bar-O followed by a thorough coating over the entire surface of Truscon Bar-Ox (color and number).

Other Truscon Bar-Ox Steel Paints

Bar-Ox Smokestack Coating, Boiler Front Coating, Acid Coating, Alkali Coating, Embedded Coating, Conduit Coating, Gas Holder Coating, Aluminum Coating.

Truscon Asepticote, Washable Wall Coating

Asepticote is non-porous, sanitary, washable wall coating combining decoration with durability to an unusual degree.

Asepticote has proved in actual service and in tests conducted by institutions and building managers throughout the country, that its waterproofed, decorative film will withstand the abuse of repeated washings or scrubbing with alkaline washing compounds. Our representative will gladly demonstrate these unusual qualities of Asepticote to any architect or engineer.

Only 2 coats are necessary to secure a uniform, decorative and washable wall surface, by the use of Truscon Asepticote over Truscon Alkabar as the priming and sealing medium.

Truscon Alkabar, Wall Sealer

Alkabar is a specially developed alkali resisting wall primer or sealing medium that effectively overcomes the action of free lime and moisture in green plaster. Its use eliminates wall painting troubles such as suction, lime burn, etc., that are so often caused by failure of the "foundation" coat.

Specifications for Washable Wall Coating

Repair all cracks and damaged places. Before painting be sure the surface is free from dirt, grease, or other foreign deposits.

First Coat—1 qt. of Truscon Asepticote of the same color as finish coat shall be added to each gallon of Alkabar. The resulting mixture shall be thoroughly agitated before being applied and care shall be taken to see that it is brushed thoroughly into the surface to present a uniform even coating, and allowed 24 hours for thorough drying. Should any flat spots develop, due to unusual porosity, they shall be touched up with a spot coat of Truscon Alkabar before applying Asepticote.

Second Coat—After the above sealing coat has been allowed at least 24 hours' drying time, apply the finish coat of Truscon Asepticote flowed on to the surface and brushed out lightly to a uniform even finish. If on continued exposure to the air in an open package, Asepticote becomes thick and heavy, it shall be thinned with the minimum amount of turpentine to give a body of the original consistency.

Note: In exceptional cases it may be desired to specify a three-coat application, the third application shall be Truscon Asepticote applied as it is received in the package.

Truscon Wall-Lite, Mill White Paint

A long oil pure white paint for walls and ceilings of industrial interiors, etc., where light reflection is desired.

Wall-Lite Finishing is furnished in enamel, egg-shell and flat. It presents a dense, pure white film that is extremely durable and, when soiled, may be washed and renewed to its original whiteness.

Specifications for Mill White Paint

Surfaces to be painted shall be free from all dust and loosely attached matter, and oil or grease spots shall be touched up with a spot coat of Truscon Bitubar, or a thin coat of shellac.

New Construction—First coat shall be Wall-Lite Primer, applied as it is received in the package. Care shall be taken to see that the material is thoroughly brushed into the surface to insure proper penetration.

Second Coat: After the first application has been given 36 to 48 hours for drying, apply 1 coat of Truscon Wall-Lite Undercoater, and allow 36 to 48 hours' drying time before applying the final coat of Wall-Lite Finishing (Enamel or Eggshell). If to be applied by spray, thin to proper consistency with Truscon Wall-Lite Reducer. If by brush, no thinning is necessary.

Truscon Wood Floor Preservative

For preserving wood floors against dry rot and decay. Different from ordinary floor oils in that Truscon Wood Preservative is absorbed into the wood and dries, binding the fibers into a tough, wear-resisting mass. Truscon Wood Floor Preservative darkens the floor slightly (usually a desirable feature), but leaves no slippery film.

Truscon Floor Enamel

Truscon Floor Enamel is a material developed for the express purpose of enameling cement floors above grade. Truscon Floor Enamel is easy to apply, and thereby assures complete application being made. It dries to a tough elastic film with a subdued gloss that does not easily mar nor show scratches. Truscon Floor Enamel is furnished in 6 standard colors.

Specifications for Floor Enamel

The floor to be coated shall be absolutely dry and free from dust, grease, etc., before beginning work. Surface shall receive 1 application of Truscon Floor Sealer to uniform the surface.

Truscon Floor Enamel shall be applied directly to the dried surface with a good stiff 4-in. brush. Special care shall be taken to exert sufficient pressure during application so as to force the enamel thoroughly into the surface pores. 48 hours shall be allowed as drying time before subjecting enameled surface to light traffic.

Note: Where it is not desired to enamel concrete floors, it is recommended that they be treated with Truscon Agatex Chemical Floor Hardener, or Truscon Granitex, so as to eliminate dusting and disintegration of the surface.

Truscon LumeTex (Aluminum Coating)

Owing to the fact that freshly mixed aluminum paint has greater lustre, light reflecting value and "leafing" than ready mixed aluminum paint—Truscon LumeTex is put up in a special 5-gal. double compartment container in which the aluminum powder is kept separate from the liquid. The paint is thereby freshly mixed for the job.

LumeTex is obtainable in three types, namely: *LumeTex "A,"* for interior surfaces, walls, ceilings, including radiators; *LumeTex "B"* for exteriors, such as tanks, gas holders; *LumeTex "C"*—heat resisting, intended for metal smokestacks, ovens and other such surfaces where the temperature ranges fairly high.

Quantity Required—Metal—600 sq. ft. per gal. 1 coat; 350 sq. ft. per gal. 2 coats.

Concrete or brick—400 sq. ft. per gal. 1 coat; 250 sq. ft. per gal. 2 coats.

Truscon Fume-Saf

White enamel. (Also obtainable in eggshell finish.)

Intended for chemical exposures, such as hydrogen sulphide, aniline and similar fumes which darken ordinary white enamel quickly.

Truscon Fume-Saf is recommended for use wherever a white enamel or eggshell finish is required in chemical laboratories, bleacheries, rubber storage plants, bakeries, etc.

Quantity Required—Fume-Saf Undercoating: concrete and masonry—200 sq. ft. per gal. 1 coat; wood 250 sq. ft. per gal. 1 coat.

Fume-Saf Eggshell or Enamel: about 300 sq. ft. per gal. 1 coat.

Varnishing Interior Floors (Specifications)

Preparation—The floors shall be sanded to a perfectly smooth surface and cleansed of all dust, dirt, grease and oil stains, before any application is made.

First Coat on Open Grain Woods—Truscon Paste Wood Filler (color desired) shall be applied to the entire surface. When the filler has started to set, it should be wiped across grain, with burlap or excelsior.

First Coat, Varnish—Shall be Truscon Waterproof Varnish, Finest, thinned with pure turpentine in the proportion of 1½ pt. to 1 gal. of varnish. When dry, this coat shall be sanded lightly with 00 sandpaper.

Second and Third Coats, Varnish—Shall be applied without thinning allowing 24 to 48 hours as drying time between coats. Second coat shall be sanded with 00 sandpaper and all dust removed before applying final coat.

Varnishing and Staining Interior Trim

Truscon Waterproof Varnish, Finest, is especially adaptable for interior trim. It is not affected by steam, cold, or water and presents a finish of the utmost depth and lustre with the fewest number of coats. It will not mar white nor chip when scratched. Truscon Waterproof Varnish, Finest, may be safely specified for exterior as well as interior use. It is extremely durable even under severe exposure.

Specifications for Interior Trim

Preparation—All wood shall be clean, dry and smooth before any filler or varnish is applied.

First Coat—Truscon Oil Stain (color desired).

Second Coat—For open grain woods only—Truscon Paste Wood Filler of same color as stain shall be applied and wiped off to remove excess filler, with burlap or excelsior.

Third Coat—A thin application of shellac shall be applied after the filler has been allowed 12 to 24 hours for thorough drying.

Fourth and Fifth Coats—Truscon Waterproof Varnish, Finest, applied as received in the package.

Note: Second coat shall be eliminated on close grain woods.

Truscon StoneTex for Exterior Masonry

Truscon StoneTex is a specialized masonry coating combining decoration with durability. StoneTex effectively protects masonry from disintegration, by eliminating the absorption of moisture into brick, concrete and stucco. Moisture absorbed into such surfaces, contracts and expands with temperature changes, causing checking, cracking, and finally complete disintegration. From the viewpoint of decoration and protection, it is equally applicable to old and new masonry structures. It is supplied in 10 attractive shades that dry with a finish that closely resembles masonry.

Specifications for Coating Exterior Masonry

All surfaces must be absolutely dry and free from loosely attached matter—dirt, dust, grease, etc.

Application—Unpainted Surfaces—First Coat—Truscon StoneTex thinned in proportion of 1 gal. of StoneTex liquid to 5 gal. of StoneTex brushed out to a uniform even coating. Care shall be taken to stipple StoneTex into all uneven surfaces so as to insure complete application. 48 to 72 hours shall be allowed as drying time before applying final coat.

Second Coat—Truscon StoneTex applied as it is received in the package without thinning. If due to exposure in an open package, it becomes necessary to thin StoneTex, it may be reduced with a minimum amount of turpentine.

Painted Surfaces—The surface to be painted must be firm, clean and dry. All loose, blistered or scaly paint shall be removed down to a firm base, by wire brushing or scraping, before any StoneTex is applied. All bare spots shall receive a spot coat of StoneTex, reduced with 1 qt. of StoneTex Liquid to 1 gal., and allowed 48 hours as drying time.

To the thoroughly dry surface, apply a uniform application of StoneTex as it is received from the package. Care shall be taken to see that StoneTex is brushed well into the surface to insure bonding to the old paint.

Bay State Brick and Cement Coating

Defects in Concrete, Brick and Porous Masonry—For over a quarter of a century, Bay State Brick and Cement Coating has been successfully used to overcome the principal defects of brick and concrete construction—porosity, hair-cracking and monotony of color.

Porosity—Which directly or by capillary attraction admits water and dampness is the chief cause of deterioration in surfaces of which cement or other clay products is the base.

Hair-cracking—The formation of tiny hairline cracks is often apparent, soon after completion, in the surface of concrete and stucco construction. This cracking of the surface steadily increases with the life of the building and, unless arrested, absorbs moisture which freezes, expands and enlarges the cracks, thus accelerating disintegration and decay not only of the surface itself but of the metal lath and steel re-enforcing which supports it.

Salt—The formation of salts on the surface of porous brick is a common characteristic that causes unsightly discoloration on the front of many buildings.

THE BAY STATE
TRADE-MARK
(Reg. U. S. Pat. Off.)

Correction of Defects—These common defects in cement, stucco, concrete and porous clay products can be corrected and further destruction eliminated by coating the surface with Bay State Brick and Cement Coating. The pores and hairline cracks are sealed from moisture and heat, thus waterproofing the entire surface above grade, at ordinary atmospheric pressure. Care must be taken to see that moisture does not reach the interior of the concrete, cement or stucco from other sources.

Characteristics

Bay State Brick and Cement Coating is a paint of medium consistency, very easy working under the brush and dries to a very hard, absolutely flat finish, quite rough in texture. It does not change the texture of the surface to which it is applied but penetrates well into the pores and becomes an integral part of the surface itself. The life of this surface coating is extremely long, averaging at least 5 years, while many exterior applications are today 10 or 15 years old and still retain their protective and decorative qualities. It may be washed or cleaned without damage either to itself

For Public Institutions

For Residences

or to the surface which it covers. One coat equals in opacity two coats of lead and oil or ordinary cement paints, which represents a true economy in the saving of labor and material.

Color

The monotonous color of most cement, concrete and stucco work, as well as the wide variety of colors in common brick, is satisfactorily overcome by a surface coating which will supply a wide variety of colors and will allow the architect a wide choice in which to exercise his own artistic preference.

Bay State Brick and Cement Coating is manufactured in white and twelve colors that have been selected as of greatest service to the architect. All colors may be intermixed with white so that there is a wide range for the expression of individual taste.

The color is not affected by steam or gases when used for interior work.

Uses

Bay State Brick and Cement Coating may be used on either interior or exterior surfaces of cement, plaster, poured concrete, troweled concrete, stucco (either sand finish, spatter dashed or troweled), brick, porous stone (as limestone), or in fact any absorbent masonry material.

Do not recommend Bay State Brick and Cement Coating over old dead coats of paint, over whitewash or kalsomine, on vitreous or non-porous surfaces, or surfaces saturated with moisture, over efflorescence or other indications of excessive alkalinity, over hard finish white plaster (without first priming—as for flat wall paints) below grade on an inside surface—without first making sure the outside surface has been waterproofed. On an inside wall, to correct leaking walls, use it on the surface exposed to the moisture.

Covering Capacity

The following table shows the covering capacity of the coating for the first coat, under ordinary conditions; subsequent coats cover about 10 per cent more surface.

	Sq. ft. per gal.
Smooth troweled concrete.....	200 to 250
Sand finish concrete, stucco or cement plaster.....	175 to 200
Common brick	160 to 180
Rough troweled stucco, etc.....	150 to 175
Spatter dash stucco (mud spatter).....	125 to 150
Spatter dash stucco (extra rough).....	90 to 100

Specifications for Bay State Brick and Cement Coating

Cement, Stucco, Cement Tile, Concrete—For interior or exterior surfaces of cement, stucco, concrete, artificial stone or cement tile where designated, apply 1 coat (2 coats if necessary) of Bay State Brick and Cement Coating of the color specified.

Preparation of Surface—New Work—The surface to be coated shall be reasonably dry, and all dust, dirt, or loose particles removed.

Salts or alkalis that appear on the surface shall be removed with a wash of sulphate of zinc, 4 pounds dissolved in 1 gallon of water. Grease or oil from forms or other causes shall be removed with a wash of benzine.

The surface shall be coated as soon thereafter as it is sufficiently dry.

Old Work—The surface to be coated shall be reasonably dry, and all dust, dirt or loose particles removed.

Salts or alkalis that are present on the surface shall be removed with a wash of sulphate of zinc, 4 pounds dissolved in 1 gallon of water. All grease or oil shall be removed with a wash of benzine.

The surface shall be coated as soon thereafter as it is sufficiently dry.

Exterior surfaces previously coated shall be sand-blasted, wire brushed, or otherwise properly prepared to permit coating to bond directly with uncoated surface.

Application—For one-coat work the coating shall be applied as it comes in the original package. For two-coat work the first coat shall be thinned with 1 pint of Bay State Brick and Cement Coating Reducer to the gallon of Coating. The second coat shall be applied as it comes in the original package.

Allow 48 hours between coats for drying.

The coating shall be applied freely from a full 3½ to 4-inch clean bristle brush.

The coating as it comes to the job shall be stirred thoroughly before and during application.

If thinning is necessary at any time, only Bay State Brick and Cement Coating Reducer shall be used.

Pneumatic Spray Gun—If the coating is applied with a pneumatic spray gun, the air pressure shall be kept at minimum, and the nozzle held close enough to the surface to insure the coating a perfect bond.

Porous Brick and Other Porous Clay Products—Specifications the same as above, except that salts or alkalis that appear on the surface shall be removed with a wash of muriatic acid, 1 part to 10 parts of water followed by a wash of clear water.

TRADE-MARK

(4) **Easy to Tint**—Being an all-oil product, with its pigments ground to the finest degree, Barreled Sunlight is admirably adapted to tinting. The simple addition of ordinary colors-in-oil produces clear, sharp, lasting tints. For attractive tints to specify, see our "Suggestions for Tinting" color card. In quantities of 5 gal., or over, we tint to order at the factory without extra charge.

Barreled Sunlight Enamel Finish—for Interior Walls and Trim

Because of its outstanding advantages, Barreled Sunlight highly recommends itself for use in hotels, apartment houses, schools, office buildings, institutions, etc., where the chief objects of painting are durable beauty, cleanliness and adequate lighting.

These definite advantages which have led to the widespread use of Barreled Sunlight, we list below:

(1) **Unique Beauty**—There is something distinctive and unmistakable about the appearance of any surface finished with Barreled Sunlight. It has a pleasing rich depth of finish peculiar to itself. This is due largely to the extreme care and thoroughness exercised in the special methods by which the pigments are ground and mixed with an all-oil base.

(2) **Lasting Whiteness**—Barreled Sunlight, the Rice Process White, is guaranteed to remain white longer than any oil gloss paint or enamel, domestic or foreign, applied under the same conditions. If it does not do so, we will give, free, enough Barreled Sunlight to repaint the job.

(3) **Resistance to Dirt—Washability**—The actual photographs below show why Barreled Sunlight resists dirt and is so easy to keep clean. Its surface is absolutely smooth, even and non-porous, offering dust and dirt no foothold. It washes like tile and is so durable that repeated washing will not injure the surface or mar its beauty.

Ordinary Flat Finish
White Paint

Barreled Sunlight Gloss
Finish

Photomicrographs Taken Through a Powerful Microscope,
Each Paint Surface Being Magnified to the Same Degree

Barreled Sunlight Finishes

Barreled Sunlight is made in four finishes—Gloss, Semi-Gloss, Eggshell and Flat—to suit the taste of the individual architect and owner.

The gloss should not be confused with the hard, glaring gloss of ordinary paint or enamel. Rather it has a soft, satinlike luster peculiar to itself—an appearance which has brought about a widespread use of this finish in places where formerly the architect specified flat or eggshell.

Barreled Sunlight for Industrial Interiors

The gloss white idea for interior painting was introduced by Barreled Sunlight many years ago. And since that time we believe it has held the leadership as the pioneer product for plant interior painting.

Its combination of intense whiteness (see guarantee in opposite column), easy washability, hiding power, ease of flow (brush or spray), all tend to make it the ideal finish for industrial interiors, from the standpoint of cleanliness, adequate light-reflection and reasonable cost.

Interior Barreled Sunlight Specifications

General Precautions—No painting should be done until the building is enclosed and heated, except in dry summer weather.

For best results with any paint, time should be allowed for plaster, concrete, cement, and unseasoned lumber to become as dry as possible before painting.

At all times have room well ventilated where paint is being applied in order to prevent condensation.

Apply the paint, especially the finishing coat, when the air is free from moisture.

Always allow each coat of paint to dry *hard* before the application of each succeeding coat.

When applying on cold surfaces it has been found that warming the paint assists in ease of spreading.

Stir thoroughly before using.

Never use linseed oil, varnish or drier, as a thinner for finishing coats.

If the Gloss or Semi-Gloss has thickened a little on standing, reduce with a trifle of turpentine or mineral spirits.

The Flat and Eggshell finishing coats are extremely heavy in body. They should be thinned very liberally with turpentine or mineral spirits until they flow out evenly, free from brush marks.

Wood and Similar Surfaces—Clean from all surfaces mildew, mortar, grease, or anything else detrimental to paint.

First Coat: Barreled Sunlight Undercoat. This may be reduced to a proper brushing or spraying consistency with turpentine (or mineral spirits).

Continued on next page

Second Coat: If knots or sappy spots show through priming coat, shellac these well with pure white shellac and apply second coat of Barreled Sunlight Undercoat. Reduce, if necessary, as above.

Third Coat: Barreled Sunlight (Gloss, Semi-Gloss, Eggshell, or Flat). Keep brush well filled with paint when applying. See "General Precautions" preceding page for reducing.

Concrete, Brick and Cement-Plaster—Clean from all surfaces excess mortar, grease, oil, etc. To assist in neutralizing alkaline conditions, we recommend the application of a zinc sulphate solution (2 lb. of zinc sulphate crystals per gallon of water). Allow to dry thoroughly and proceed as follows:

First Coat: Barreled Sunlight Granolith. This coat should be reduced with Rice's No. 65 Reducing Oil or boiled linseed oil, using liberal quantities according to the porosity of the surface. Rice's No. 65 Reducing Oil acts as a "sealer" to insure uniform appearance of succeeding coats.

Second Coat: Barreled Sunlight Granolith. This may be reduced to a proper brushing or spraying consistency with turpentine (or mineral spirits).

Third Coat: Barreled Sunlight (Gloss, Semi-Gloss, Eggshell, or Flat). Keep brush well filled with paint when applying. See "General Precautions" for reducing.

Hard Finish Lime and Gypsum Plaster—Prepare surfaces as under heading "Concrete, Brick, and Cement-Plaster."

First Coat: Barreled Sunlight Granolith. This coat should be reduced with at least 2 gal. of Rice's No. 65 Reducing Oil to 1 gal. Granolith. To this mixture add sufficient turpentine (or mineral spirits) so that the material will flow and level without brush marks. If this Reducer is not available, boiled linseed oil may be used, but best results are obtainable with Rice's No. 65 Reducing Oil.

Second Coat: Barreled Sunlight Granolith. This may be reduced properly with turpentine (or mineral spirits). Reduce sufficiently so that no brush marks appear.

Third Coat: Barreled Sunlight (Gloss, Semi-Gloss, Eggshell or Flat). Keep brush well filled when applying.

Iron, Steel and Metal Work—Remove all scale, rust, or grease by scraping. Apply a coat of Rice's Red Oxide Anti-Corrosive Primer or Pure Red Lead Paint.

First Coat: Barreled Sunlight Undercoat. This may be properly reduced with turpentine (or mineral spirits).

Second Coat: Barreled Sunlight Undercoat. Reduce if necessary as above.

Third Coat: Barreled Sunlight (Gloss, Semi-Gloss, Eggshell, or Flat). Keep brush well filled with paint when applying. See "General Precautions" for reducing.

Two-coat Work—By reason of the intense opacity of Barreled Sunlight, and where economy is desired, it will be found possible to obtain a solid white finish with two-coat work. Proceed as instructed for three-coat work simply omitting the intermediate coat.

Repainting Over Oil Paint—On surfaces previously painted with a white oil paint in fairly good condition, generally a single coat of Barreled Sunlight (Gloss, Semi-Gloss, Eggshell or Flat) is sufficient. See "General Precautions" for reducing. Where two-coat work is necessary as over another color or where the white now on is in poor condition specify Barreled Sunlight Undercoat as a primer thinned down as recommended.

Repainting Over Cold Water Paint or Whitewash—Scrape all loose scale and dirt from surface, using wire brush. Brush off with brooms. Apply Barreled Sunlight Undercoat liberally thinned with boiled linseed oil.

If there are from one to three applications of cold water paint now on, the proportion of thinner should be about 1 qt. of boiled linseed oil to the gallon of Barreled Sunlight Undercoat. Where there are more than three coats on the surface to be painted, the oil should be increased to a proportion of equal parts boiled linseed oil and Undercoat. Allow three or four days for drying, then apply finishing coat of Barreled Sunlight (Gloss, Semi-Gloss, Eggshell or Flat). See "General Precautions" for reducing.

Spreading Capacity of Barreled Sunlight

On any primed or previously painted surface, Barreled Sunlight finishing coats and undercoat will cover about 400 sq. ft. per gallon. On new wood or metal, Barreled Sunlight Undercoat somewhat less.

Over new brick, concrete or plaster, Barreled Sunlight Granolith from 200 to 300 sq. ft. per gallon, depending on the porosity of the surface.

Barreled Sunlight Chemic Enamel (for Interior Use)

For use where unusual conditions prevail, such as in hotel and restaurant kitchens, engine rooms, labora-

tories, etc., where fumes and excessive heat exist. It provides a smooth, white, washable finish as does Barreled Sunlight, but has the added properties of resistance to fumes and heat.

Specifications—Follow regular first coat Interior Barreled Sunlight specifications.

Second Coat: Barreled Sunlight Flat. This must be reduced to a proper brushing or spraying consistency with turpentine (or mineral spirits).

Third Coat: Barreled Sunlight Chemic Enamel (Gloss, Eggshell or Flat). Where two-coat work is desired omit the intermediate coat.

Rice's Acoustolight

Architects in their employment of acoustical materials have long desired a finish that would permit the application of the color scheme without sacrificing the acoustical properties. As the use of acoustical materials has increased, the need for such a finish has become even more pronounced. Foreseeing this need we have developed a material to meet it.

Rice's Acoustolight makes it possible for the architect employing acoustical materials (acoustical plasters, felts, boards, etc.); to apply by either brush or spray, a washable paint finish in white or any color desired—without greatly impairing surface porosity. These peculiar properties of Rice's Acoustolight are due to its special binder and the fineness of its pigments.

On request, our representative will demonstrate the application of Rice's Acoustolight.

Outside Barreled Sunlight

This unique paint represents the very last word in the technology of paint for exterior use. The formula developed combines the proper pigments necessary for outdoor exposure and an adaptation of the Rice Process of treating the oil—the process which has so greatly contributed to the high quality and reputation of Interior Barreled Sunlight.

Whiter than the average outside white, Outside Barreled Sunlight is also free-flowing, has great hiding power, and dries with a good gloss. Durable and even wearing, it is in good condition when repainting becomes desirable.

Note: Outside Barreled Sunlight is actually the crowning achievement of over twenty years' specialization on white paint, exclusively. The gratifying result of our fixed determination to produce the very finest exterior white paint that we could make.

Sold primarily in the white, Outside Barreled Sunlight is easy to tint with ordinary oil colors. On quantity orders, we will tint at the factory without extra charge, matching any color sample submitted. Ask for "40 Color Suggestions" sample card.

Rice's Flow-On (for Interior Use)

A practical and lasting oil paint that is rapidly replacing "flat wall paint" for ceilings and walls of office buildings, schools, hotels, institutions and public buildings of all kinds. Its advantages are:

(1) **Simplicity**—Made in semi-paste form to be reduced by the painter according to the finish required. Flow-On is used for every

coat from primer to finish. Its semi-paste form enables the master painter to adapt it to almost any interior job. Can be tinted to desired color right on the job or supplied ready tinted.

(2) **Hiding Power**—Standard specification is three-coat work, but two-coat work can be successfully done, *even in the white*. Makes a lasting stippled job in two coats.

(3) **Real Washability**—Not just spots, but a whole room can be washed and come out uniform, especially in the stipple finish.

(4) **Stipple Finish**—The most practical finish for office walls—has the appearance of a flat finish and the washability of a gloss finish. Unsurpassed for length of *useful life*.

Rice's Flow-On Specifications

General Precautions—No painting should be done until the building is enclosed and heated, except in dry summer weather. At all times have room well ventilated where paint is being applied in order to prevent condensation. Always allow each coat of paint to dry *hard* before the application of each succeeding coat.

For best results with any paint, time should be allowed for plaster, concrete, cement and unseasoned lumber to become as dry as possible before painting.

Hard Finish Plaster, Cement Plaster, and Gypsum Work—Scrape excess mortar from all surfaces. To assist in neutralizing free lime or alkaline conditions, we recommend the application of a zinc sulphate solution (2 lb. zinc sulphate crystals per gallon of water). Allow to dry thoroughly and proceed as follows:

First Coat: Rice's Flow-On. Reduce liberally with Rice's Flow-On Reducing Oil (a high grade long oil size) at least

2 gal. (or even more for extremely porous surfaces when not interfering with opacity) to 1 gal. Flow-On.

Second Coat: Rice's Flow-On. Reduce with about $\frac{1}{2}$ gal. turpentine (or mineral spirits) to 1 gal. Flow-On.

Third Coat: Rice's Flow-On. For plain flat finish, reduce with from $\frac{1}{2}$ gal. to $\frac{3}{4}$ gal. of turpentine (or mineral spirits) to 1 gal. Flow-On. For stipple finish reduce with Rice's Flow-On Reducing Oil, in place of turpentine or mineral spirits, thinning to suit the stipple desired.

Two-coat Work—By reason of the intense opacity of Rice's Flow-On, and where economy is desired, it will be found possible to obtain a satisfactory finish with two coats of Flow-On tinted. Proceed as instructed for three-coat work, simply omitting the intermediate coat.

Spraying

Barreled Sunlight products can be applied with the spray gun just as well as with the brush. Their free flowing qualities do not allow them to gum the gun nozzle.

Packages

Interior and Outside Barreled Sunlight are put up in churn-equipped steel drums of 55 and 30 gal. each, 5-gal. steel buckets, and in cans from 1 gal. down to $\frac{1}{2}$ pt. size. Rice's Flow-On and Acoustolight are put up in steel drums of 30 gal. each, 5-gal. steel buckets, and single gallon cans.

All material is to be delivered on the job in the original packages bearing the name and brand of the manufacturer.

ARTSTONE PRODUCTS

INCORPORATED

Specialists in the Manufacture of Colored Finish Coat Materials

EXECUTIVE SALES OFFICES

52 Vanderbilt Avenue, NEW YORK, N. Y.

The Products of Artstone

The products described here are STONEITE, a portland cement paint, and ARTSTONE BRUSH-KOAT, a somewhat similar product but especially suited for application over extremely rough surfaces.

For Artstone Portland Cement Stucco, Tuckahoe Colored Interior Finish, Tint-Koat Polychrome Washes, Chinawall Colored Keene's Cement Plaster, Decotex Textural Plastic, Mothite Plaster, Artstone Handball Plaster, Flooring and Mortar and Audicoustone Acoustical Plaster, see Manufacturers' Index under ARTSTONE PRODUCTS.

Stoneite Cement Paint

STONEITE CEMENT PAINT

Stoneite is a colored waterproofed portland cement paint for brush, spray or gun application. It is delivered as a dry powder in 25 and 100-lb. drums, ready for use with the addition of clean water only.

The Why and Where of Stoneite

Stoneite is an economical means of adding permanent beauty to the permanent utility of concrete, concrete block, common brick, or hollow tile structures.

It is also the solution for the problem presented by banks, stores and apartment buildings whose common brick sidewalls greatly mar the beautiful effect of their attractive front facades of limestone, marble or face brick.

Stoneite conceals unattractive walls under a permanent colored waterproof non-fading coat of portland cement which will last as long as the wall itself. Used in the light wells of apartment houses and office buildings, and in damp and musty cellars, basements, tunnels, vaults and subways, Stoneite surfaces can be readily and regularly cleaned with soap and water without injury.

The Stoneite "800" Color Line

801—Snow White	804—French Grey	808—Grey Buff
802—Nepera Buff	805—Yorkshire Brown	809—Deep Cream
803—Limestone Grey	806—Golden Yellow	810—Warm Yellow
	807—Brick Red	

Color Charts—Color charts, dry material for sample experimentation, etc., will be sent upon request.

Specifications for Stoneite Cement Paint

Preparation of Surfaces—All surfaces of (indicate) shall be covered with two coats of Stoneite Cement Paint as manufactured by ARTSTONE PRODUCTS, 52 Vanderbilt Avenue, New York, N. Y., and shall be applied in accordance with manufacturer's directions.

All masonry surfaces shall be cleaned of all dirt, grease, paint, efflorescence, whitewash or calcimine before Stoneite is applied.

Note: Stoneite depends on suction for bond and cannot be applied on enameled or oil painted surfaces. Oil paint, whitewash or calcimine must first be removed. Washing with a 20% solution of commercial muriatic (hydrochloric) acid in most cases will remove old oil paint. The acid solution should remain on the surface from 3 to 4 hours and then washed off with plenty of clean water from an open hose. Do not apply Stoneite until all paint has been removed and the wall has become thoroughly dry.

Grease or efflorescence remaining on concrete surfaces after forms are removed can be cleaned by acid washing as described above. Used on proper surfaces, Stoneite will bond perfectly and permanently.

Mixing—Use clean water, clean pails and clean tools. To each pound of Stoneite add one pint of clean, drinkable water. Mix vigorously until the material is of an even color and let stand for 15 minutes. Thereafter, stir regularly while using.

Note: Only sufficient Stoneite shall be mixed as can be used in 3 hours. The same quantity of water as was used in the first mix must be used in each subsequent mix if an even color is to be obtained. For spray or gun application a thinner mix may be used.

Wetting Down—The surface to be covered shall be uniformly wet down with water from a fog spray to cut suction

and if the surface becomes dry in spots, these areas shall be dampened again.

Application—Stoneite shall be applied in two coats of the same consistency. The second coat shall be applied after the first coat has set firm and hard.

Brush Application—Clean 4 to 6-in. brushes only shall be used. Laps and joinings shall be avoided.

Machine Application—Clean spray machine thoroughly before and after use. Material must not be left in hose or pump for more than 30 minutes. If Stoneite is applied by a machine which hydrates the material at the nozzle, care must be taken to insure proper hydration.

Note: Do not apply Stoneite during freezing weather.

Curing—While not always necessary, particularly in moist climates, we urgently recommend that all surfaces covered with Stoneite be cured with water whenever possible. Give the second coat 24 hours to dry and bond and then wet down once daily for two or three days with fog spray attachment on hose.

Coverage

The coverage of 1 lb. of Stoneite will vary from 8 to 12 sq. ft. for two coats, depending on the porosity and evenness of the surface to be covered.

Polychrome and Antique Effects

Polychrome effects are produced while second coat is being applied. One or more colors are brushed on here and there and blended together with a damp brush. Over brick, the appearance of age can be obtained by pasting wrapping paper (use flour paste) over bricks and removing paper after work is finished.

Distribution

Stoneite Cement Paint may be obtained from leading building supply dealers and paint stores in the United States and in foreign countries.

Artstone Brush-Koat

Similar in composition to Stoneite. Contains an aggregate and is particularly suited for application over rough surfaces. It is particularly recommended for outdoor concrete swimming pools because of its density.

Specifications—While the same general specifications apply as for Stoneite, Brush-Koat covers approximately 15% to 20% less per pound for two coats and is mixed 10 lb. of Brush-Koat to three quarts of water.

Colors and Coverage—Obtainable on order in all regular Artstone Stucco colors (see Artstone Stucco Color List). Shipped in 80-lb. bags only. One bag covering approximately 500 sq. ft. for two coats.

General Note

Neither Stoneite nor Brush-Koat should be used over wood, gypsum plaster, magnesite or any masonry surface in the process of disintegration. For special uses write for details.

For our pages on Plastic Texture Paint, see Manufacturers' Index

Bondex Waterproof Cement Paint, the Perfect Stucco Finish

Bondex is a decorative material designed especially for use on stucco, concrete and cinder block and building tile, brick, stone, hollow tile, and other masonry wall surfaces. While described as a waterproof cement paint, it is much more than a paint for it imparts color, waterproofs and preserves in one operation. It comes in the form of a dry powder and is made ready for use by mixing with cold water. Furnished in white and sixteen tints, which may be intermixed to produce an endless variety of shades. Bondex is applied with a brush or spray. Bondex bonds with the surface and forms an integral part of the wall itself. It has been styled "The Paint Eternal."

Warning: As Bondex adheres and bonds to porous masonry surfaces only it cannot be used on wood, wall board of any kind, metal, glass or other non-porous surfaces.

Directions for Mixing and Applying Bondex

Preparation of Surface—Bondex is suitable for use on masonry wall surfaces only. Its action is a *bonding* one and, consequently, the surface to be painted must be porous and have suction.

Unpainted Surfaces—It is simply necessary to cleanse the surface of all dirt, grease or efflorescence.

Oil Painted Surfaces—As Bondex requires suction to adhere or bond, the oil in previous undercoatings must be destroyed. Old coats of paint should be entirely removed by sandblasting, but if only one or two coats have been applied, an acid wash usually serves to destroy any remaining oil present in the film and create sufficient suction for Bondex to adhere. Use a 15% solution of muriatic (hydrochloric) acid and allow the acid solution to remain on the surface three hours before removing. Wash clean with clear water and allow to dry before applying Bondex.

Whitewashed or Calcimined Surfaces—Thoroughly remove all old scaling whitewash or cold water paint with a wire brush. Wash with a sponge. If undersurface has been sized with a gloss oil or varnish size, follow directions in preceding paragraph.

Poured Concrete—In pouring concrete during winter months it is the custom to grease the forms, or moulds. If Bondex is to be applied over such a surface, treatment outlined under caption "Oil Painted Surfaces" is necessary.

Mixing—Use clean metal pails. To each 10 lb. of Bondex add 3 qt. of water; stir until smooth. Add 2 qt. of water; stir thoroughly and allow to stand 15 minutes. It is then ready for use. Correct proportions for use on average surfaces are 1 pt. of water to 1 lb. of Bondex. A slightly thinner mix may be used on extremely porous surfaces and for spray application—5 lb. of Bondex makes approximately 1 gal. of liquid paint. Always use same proportions of Bondex and water. Different amounts will not produce uniform colors. Bondex must first be mixed to a paste thickness before reducing; otherwise the ingredients do not all dissolve.

Caution: Do not mix more Bondex than is required for one-half day's use. It will set if allowed to stand overnight and be worthless the next day. Mix just enough for four hour's use. Keep containers tightly closed as Bondex is affected by exposure to air or moisture.

Blending Colors—All tints and white may be intermixed to form an endless variety of shades. Tints must be mixed with water separately and then intermixed in the liquid state. Do not attempt to tint Bondex by adding dry colors, because for uniform results the colors should be *milled* in, not just mixed. In extreme cases where tinting is necessary, use only limeproof mineral or metallic colors. Avoid the use of chemical or aniline colors, as they will fade.

Application—Bondex relies upon moisture to complete its setting process. Moisture in the air frequently suffices but in dry climates and on interiors, artificial moisture must be furnished. It is sometimes necessary to wet down the surface with water before applying Bondex. This

makes Bondex work easier, helps to avoid laps and hastens its setting process.

Two coats of Bondex are necessary for a thoroughly waterproof job. One coat will not effectually seal the surface against moisture penetration. Always be safe and apply two coats; the second from 4 to 24 hours after the first.

Use a clean wide calcimine brush or spray machine. If a spray is used, *do not allow the mixed Bondex to remain in the pump or hose* when not using for more than a half-hour, as it will set up and ruin the hose and pump. Avoid laps when applying as the second coat dries out lighter than the first. Do not apply Bondex during freezing weather or when there is frost in the surface. Bondex may appear soft after drying but it will become as hard as flint after a few days' exposure.

On Magnesite Stucco—First prepare surface by filling all cracks with a suitable mixture of magnesite plaster. (Bondex will not serve as a crack filler on magnesite.) Surface must be perfectly dry before first coat is applied. After first coat is thoroughly dry, apply second coat, using Bondex for second coat at as heavy a consistency as possible.

Caution: Bondex must not be applied to a wet magnesite stucco surface or wet surface between coats. Moisture will be sealed in, resulting in dripping between inner and outer walls or water stains appearing on inside walls. Unless two coats of Bondex are applied, invariably a heavy efflorescence forms on the surface which is almost impossible to remove.

Blended and Multi-toned Effects—Blended effects are obtained by applying a base coat of the desired color and immediately spotting on the other colors to be blended and working together with a dampened brush. Highlighting effects are obtained by applying Bondex in the usual way and wiping with a dampened cloth or brush, working to produce a uniform effect.

Covering Capacity—Ten pounds of Bondex will cover from 80 to 125 sq. ft., two coats, depending on the porosity and texture of the surface.

Packing—Bondex is packed in 5-lb. cans and 100-lb. fiber drums for domestic shipment, and in 100-lb. steel drums for export.

Lumnite Factory White Cold Water Paint

For interiors of mills, factories and other industrial plants. It is intensely white and adheres perfectly to wood, brick, plaster, cement, stone, metal or tile.

Alfresco Exterior (Dampproof) Cold Water Paint

For temporary exterior work on barns, fences, county fair buildings, race tracks, amusement resorts, etc., and as a happy medium between mill white oil paint and ordinary interior cold water paint for interior work. Will last a year or a year and a half outside.

Solarite Wall Coating

"The Peer of All Cold Water Wall Coatings" for interior wall and ceiling decoration in residences, apartments, hotels, etc. Furnished in white and a variety of tints.

Cresto Wall Finish

Same as Solarite except that it must be used with boiling water. Produces a velvety surface, rich and beautiful in tone.

ARTSTONE PRODUCTS

INCORPORATED

Specialists in the Manufacture of Colored Finish Coat Materials

EXECUTIVE SALES OFFICE

52 Vanderbilt Avenue, NEW YORK, N. Y.

The Products of Artstone

The products described here are DECOTEX, a textural plastic, TINT-KOAT, a colored wash material for polychromes, and MOTHITE, a moth repellent plastic.

For Artstone Portland Cement Stucco, Artstone Handball Material, Artstone Mill-mixed Mortar and Flooring, Tuckahoe Colored Interior Finish, Chinawall Colored Plaster, Stoneite Cement Paint and Artstone Brush-Koat, see Manufacturers' Index under ARTSTONE PRODUCTS.

Decotex Textural Plastic

Decotex is the result of long, patient, scientific research in the laboratory and in the field. It is a true textural plastic and possesses every advantage in spread, adhesion, ease of application, hiding power and—color!

Delivered as a fine powder in white and five standard colors, the addition of only clean, drinkable water produces a material of remarkable plasticity, quality and strength. Decotex adheres perfectly and permanently to any properly treated firm surface and sets without shrinkage.

The Why of Decotex

Decotex is self-decorating and though it may be waxed, glazed or colored after application, such treatment is not necessary. This use of color, integrally mixed at the mill, makes Decotex an economical, all-purpose material for interiors in either old or new buildings.

Decotex is adapted to brush, sponge or trowel application and permits the architect to include it under either paint or plaster specifications.

While Decotex is essentially a true plastic and its ease of brush application makes it a highly prized material with painters, the architect frequently finds it to his advantage to include Decotex in the plaster specifications.

Color

Colored Decotex possesses animation without gloss. The character of the pigments used prevents that anæmic appearance which so frequently mars an otherwise attractive wall finish.

The pigments used are absolutely permanent and are unaffected by the actinic rays of the sun.

DECOTEX

TEXTURAL PLASTIC

STANDARD DECOTEX COLORS

901—Snow White	904—Golden Tan
902—Travertine Buff	905—Ivory
903—Deep Cream	906—Golden Yellow

Note: Where the size of the job does not warrant the manufacture of special colors, mineral pigments may be mixed with white or colored Decotex to produce other colors.

Color Charts—The Decotex Color Chart will be sent upon request.

Textural and Color Possibilities—An almost limitless variety of textural effects and color combinations is possible with Decotex. Stipple, sponge, swirls, brush and all types of decorative textures are readily obtainable.

Specifications for Decotex

General—All surfaces shall be clean and dry and free of dust, dirt, grease, wax and efflorescence.

Note: Decotex may be applied to all unpainted plaster surfaces that are hard and set without further treatment. Greater spread and ease of application result when a size of shellac or shellac substitute is used before Decotex is applied. Extremely smooth or glossy surfaces are oftentimes difficult to properly cover in which case a size of shellac or shellac substitute should be used.

Finish Coat—The finish textural surface shall be produced with Decotex as manufactured by ARTSTONE PRODUCTS, 52 Vanderbilt Avenue, New York, N. Y., color and texture to be selected by the architect. Decotex shall be applied in accordance with the manufacturer's directions.

Note: Include in Paint or Plaster Specifications as desired.

Coverage

Decotex is packed in 10 and 50-lb. waterproof, paper-lined cloth bags and will cover from 10 to 1½ yd. to each pound, depending entirely upon the type of texture selected and the evenness and nature of the surface to be covered.

Tint-Koat Polychrome Washes

Many beautiful and striking polychrome effects can be produced with the use of Tint-Koat. Tint-Koat is a semi-glaze and its use will not destroy the soft color value which is an inherent property of Decotex. Tint-Koat is mixed with clean water and is thinly applied with sponge or calcimine brush after the Decotex has set. All excess is sponged off within a few minutes after application. After it has dried and set, Tint-Koat becomes a part of the wall and does not peel or flake off.

TINT-KOAT POLYCHROME WASHES		
T-1—Brown	T-5—Blue	T-8—Buff
T-2—Travertine	T-6—Orange	T-9—White
T-3—Green	T-7—Black	T-10—Red
T-4—Yellow		

Coverage of Tint-Koat

Tint-Koat comes in 1, 5 and 25-lb. packages.

One pound will cover from 10 to 30 sq. yd., depending upon the texture and water content used to regulate depth of color.

Note: Tint-Koat cannot be used as a paint. The material is only designed to produce multi-tone effects and has very little hiding power. Water content has an important bearing on depth of color, and if darker tones are required, less water should be used. Material should be stirred constantly while in use and will not spoil if left mixed overnight. Tint-Koat colors may be mixed with one another to produce other colors and white Tint-Koat may be used to lighten colors when necessary.

Mothite Plastic

Mothite is a plastic moth-repellent. The characteristic pleasant aroma of cedar is an inherent property of the material. The presence of other scientific moth-repellent factors increases the efficiency of Mothite, assuring greater protection. Mothite can be economically and effectively used in closets and storage rooms, in old and new buildings. With Mothite, protection is secured at low cost.

Mothite completely seals the surface. In old buildings, its application will seal cracks and openings caused by the shrinkage of door frames, baseboards, shelving, etc. It may be applied over the gypsum brown coat and on almost any type of interior surface properly prepared for its reception. It can be applied by brush or trowel and, therefore, can be included in either paint or plaster specifications.

Note: The odor of Mothite lasts indefinitely, except when continually exposed to light and air. With Mothite Liquid, a special preparation for brush or spray application, the odor may be renewed at periodic intervals. The use of the liquid is recommended and insures the permanency of protection. Mothite Liquid

Moth-Repellent

can also be used effectively to renew the cedar aroma of cedar closets in old buildings.

Color—In cedar red only.

Specifications for Mothite

All closets (indicate) shall be finished with Mothite as manufactured by ARTSTONE PRODUCTS, 52 Vanderbilt Ave., New York, N. Y., and shall be applied in accordance with manufacturer's directions.

Note: Mothite can be included in either paint or plaster specifications. Trowel application is preferred on new work, particularly where the hard white coat is to be omitted. For application to old painted surfaces, special specifications will be sent.

Coverage

Mothite is shipped in 10 and 50-lb. sealed containers. One pound will cover from ½ to 1 yd., depending upon the type of surface to be covered.

ARTWALL WATERALL COMPANY

INCORPORATED

Manufacturers of Muro-Roc Wall Texture Finish, Surfacer and Glaze
Muro-Lac Cold Water Paint

770 South Schuylkill Avenue, PHILADELPHIA, PA.

Products

MURO-ROC WALL TEXTURE FINISH (Plastic Paint) for interior decoration.

MURO-ROC SURFACER, a liquid size or sealer for preparing surfaces for wall texture finish.

MURO-ROC GLAZE, a waterproof glazing and coloring compound for wall texture finish.

MURO-LAC, a cold water paint.

Muro-Roc

A white powder, which, when mixed with water, becomes a wall texture finish (plastic paint). Any desired texture may be developed with a brush, stippler, sponge, trowel, etc. Muro-Roc may be applied to practically any interior surface, such as plaster, wall board, wood, masonry, glass, etc. Dry color may be mixed with Muro-Roc before it is applied, or a colored effect may be obtained by adding color to the glaze applied to the textured surface.

Muro-Roc Advantages—Muro-Roc is a mixture of various clays and binders, which, when mixed with water, sets up without chemical reaction. It is absolutely inert and will not burn the most delicate colors. It contains no injurious chemicals to harm the hands or injure finished woodwork. There is no disagreeable odor. Muro-Roc is easily mixed and applied, spreads and textures easily. It may be applied over any surface that can be painted.

Covering Capacity—This is dependent on the surface to which it is applied and the type of texture desired. An average of 1 lb. of Muro-Roc should be figured to cover 1 sq. yd.

Muro-Roc is sold in 5, 25 and 50-lb. packages and 300-lb. barrels. Full directions for mixing and applying are found in each package.

Muro-Roc Over Various Surfaces

Best results with Muro-Roc are obtained when applied to a dry surface having a uniform surface and rough enough to give a tooth or bond. It is generally recommended that any dry surface be given a size coat of Muro-Roc Surfacer. For smooth surfaces it is advisable to pigment this Surfacer with Muro-Roc in the proportion of 5 lb. of Muro-Roc to 1 gal. of Muro-Roc Surfacer. Briefly for:

Smooth finish plaster, old or new, when dry, use Pigmented Surfacer.

Smooth finish plaster, old or new, when damp, use no Surfacer.

Sand finish plaster, old or new, when dry, use Surfacer without pigment.

Sand finish plaster, old or new, when damp, use no Surfacer.

MURO-ROC

TRADE-MARK

Smooth wall board, use Pigmented Surfacer. Rough wall board, use Surfacer without pigment.

Note: Cover all joints in wall board with strips of fly screen about 2½ to 3 in. wide. With a broad knife cover the screen with a thick mixture of Muro-Roc, feathering down the edges.

Painted surfaces, use Pigmented Surfacer.

Note: Remove cracked or checked paint with sandpaper. For a sound coat of paint wash down with a solution of sal-soda or good paint remover to cut the surface, following with a wash of clean water before using surfacer.

Wall paper, use Pigmented Surfacer.

Note: Ordinary wall paper must be removed and the wall thoroughly washed with clean water before using Surfacer. Waterproof paper such as Sanitas, etc., need not be removed when it is well pasted to the wall.

Muro-Roc Specifications

All wall and ceiling surfaces shall be textured with Muro-Roc, manufactured by ARTWALL WATERALL COMPANY, Philadelphia, Pa., and shall be applied in accordance with the manufacturer's directions for mixing and applying.

All surfaces are to be properly prepared by sizing with Muro-Roc Surfacer in accordance with manufacturer's directions.

(a) For a one-coat application—The textures are to be in color as per approved sample. Mix dry colors in the Muro-Roc before applying, and texture, similar to approved sample.

(b) For a two-coat application—The textures are to be glazed in color as per approved sample. Apply Muro-Roc "in the white" and texture similar to approved sample. When dry size the textured surface with Muro-Roc Surfacer. When dry, apply a coat of Muro-Roc Glaze colored with Wipe down to match color of approved sample.

Muro-Roc Surfacer

A liquid surfacer for use as a size or suction stop, which is recommended before the application of Muro-Roc. It is also ideal for sizing the textured wall coat of Muro-Roc before glazing. It is packed in 1-qt. and 1-gal. cans. A gallon covers approximately 50 sq. yd.

Muro-Roc Glaze

This glazing compound is used to produce a colored effect to a textured coat of Muro-Roc. The glaze may be tinted with oil colors to get the desired shade. Glazed Muro-Roc is washable.

Packed in 1-qt. and 1-gal. cans. A gallon will cover approximately 50 sq. yd. of Muro-Roc.

Muro-Lac

An easily mixed and applied cold water paint giving a beautiful finish of exceptional durability for exterior and interior surfaces. Packed in 2, 6, 25, 50 and 100-lb. packages. A pound covers approximately 75 sq. ft. Made in white and various colors.

Samples, Service, etc.

Samples of various textures possible with Muro-Roc together with complete information regarding all products, will be gladly furnished by our service department.

A list of representative applications of Muro-Roc in various cities will be gladly furnished upon request.

Novelty Texture

Brush Float Texture

CRAFTEX COMPANY

Manufacturers of Craftex, a Water Mixed Plastic Paint for Reproducing Texture Surfaces

FACTORY AND EXECUTIVE OFFICES
37-39 Antwerp Street, Brighton Station
BOSTON, MASS.

Other Products of the Craftex Company

CRAFTESIZE, a water mixed size of unusually high grade—for general use as a film size; CRAFTCOAT, a glaze for use over Craftex and Craftesize, and for general glazing purposes.

Also Shadowall, a low priced plastic paint for textured walls.

For Sunflex, a white paint for industrial use, see Manufacturers' Index.

CRAFTEX

lasts indefinitely, practically ending redecorating expenses. Detailed specifications for the application of Craftex over wallboard, plaster, water color, concrete, brick, cinder blocks or any other surface will be supplied by the CRAFTEX COMPANY upon request.

One-coat and Glaze Coat Craftex

One-coat—An application of Craftex alone, without sizing or glazing. Craftex is applied already tinted and then textured as desired.

Glaze Coat—A Craftex texture base, sized with Craftesize and glazed with Craftcoat, which is mixed with one or more colors.

Craftex Reputation

Craftex, the *first* plastic paint, has been used by architects since 1911. It should always be remembered that Craftex is a registered trade name and applies *only* to the plastic paint made by CRAFTEX COMPANY.

Architectural Service

CRAFTEX COMPANY maintains architectural exhibits in New York, Boston, Cleveland, Detroit, where a complete range of textures and finishes may be inspected. An Architectural Service Department is ready at all times to co-operate with architects in developing new texture effects and submitting samples to meet specific requirements.

Put Up in Heavy Bags with the Label and Amount by Weight of Craftex Printed on Every Bag

Only Genuine Craftex carries the Craftex name and trade-mark (shown above)

The panel at right shows the successive steps in Craftex application. First the dry white powder is mixed with cold water, then applied to surface with a brush. It is next textured or moulded with sponge or other suitable object. Then sized and colored as desired.

Modernistic Wall Finishes

Architects find Craftex invaluable not only in reproducing hand-palmed, water-floated, troweled and stone effects, but in creating entirely new and distinctive effects in color and texture.

Craftex water float and other smooth type finishes are suitable for almost every type of building.

Stencils, sgraffito or modeled low relief work make Craftex specially suited for use in modernistic decoration.

Preparation of Surfaces for Craftex

Craftex can be applied over any surface that can be painted. It bonds permanently with the surface and

Assistance in developing designs and textures for modernistic finishes will gladly be given on request to the company.

Examples of Modern Craftex Finishes

BRADLEY STUC-O-TINT COMPANY, INC.

Manufacturers of Plastic Paints for Texture Work

133 West Brookline Street
BOSTON, MASS.

Products

BRADLEY STUC-O-TINT, a Plastic Paint.

BRADLEY STUC-O-GLAZE, a Prepared Finishing Liquid.

BRADLEY ONE-COTE-WITE, an Industrial White paint for concrete, stone, brick, rough plaster or wood.

BRADLEY CRACK FILLER.

Bradley Stuc-O-Tint

Description—Bradley Stuc-O-Tint was invented in 1922 by C. E. Bradley, a practical painter and contractor. He saw the need for a plastic material that could be applied easily with a brush to any surface without sizing, that could be textured easily, producing a hard, durable surface.

Bradley Stuc-O-Tint is such a plastic paint for interior texture work. It consists of a white powder which, when mixed with water, can be applied with brush or trowel or moulded into various textures. Dries with a hard, tough, reasonably elastic body. Can be sandpapered and finished with Stuc-O-Glaze, oil paint, water color or lacquer.

Advantages—Not necessary to size surface before applying.

Does not contain lime, plaster or cement.

Will not injure furniture or trim finishes.

Taping is unnecessary.

Will not injure hands.

Mixes readily with hot or cold water.

Does not rot; mixture can be kept indefinitely without hardening if covered with water.

Spreads easily; does not sap; is not sticky.

Does not crack when drying; nor peel, nor flake off.

Dries thoroughly in 6 to 24 hours, depending upon conditions.

Material can be colored in the mix with dry color. After Stuc-O-Tint has been mixed with water, either oil or dry color can be used. Can be mixed to produce an oil texture.

Covers defects in walls and ceilings such as wavy finish, trowel marks and honeycomb surfaces.

Surface—No sizing is needed for any surface.

When used on plaster, skim coat may be omitted.

When used over wallboard, if nailholes and joints are filled properly—we recommend Bradley Crack Filler—Stuc-O-Tint will hide all joints and produce an unbroken surface.

Can be applied directly upon old wall paper, or to a surface from which wall paper has been removed, without any special preparation. If wall paper contains coloring matter likely to bleed through the Stuc-O-Tint, a thin coat of white paint should be applied over Stuc-O-Tint and allowed to dry before glazing.

Artistic Textured Effects—All stipple and texture effects can be made with sponge, brush, trowel, or

1 Make thick Paste

2 Smear it on

3 Texture

4 Finishing

flat surface tool; also caen stone, travertine, grass cloth, burlap, canvas, lin-crusta, leather and weathered wood; special effects with sand, straw, dead twigs, etc., introduced into mixture.

Color—Stuc-O-Tint itself may be colored. This is recommended when economy is a factor. When textured and sandpapered, colored Stuc-O-Tint yields unusually fine high-lights, giving a soft two-tone effect that is in excellent taste. For schools, hospitals and public institutions where wall surfaces are exposed to mutilation, colored Stuc-

O-Tint, stippled or textured and painted in same color with two coats will not show white when surface is broken.

Colored at the Factory—Stuc-O-Tint may be colored in the mix at the factory to meet exact color specifications. A uniform color throughout material is thus assured.

Colored at the Job—Stuc-O-Tint can be colored at the job. First dissolve color in water or oil, depending upon its nature, and add this slowly to wet mixture until the desired color is reached. White Stuc-O-Tint is a water plastic, but absorbs oil and oil colors in the mixing.

Colored Mixtures, Blended—A new and very effective wall treatment with Stuc-O-Tint, tinted as described above. Ground color is first applied and while this is wet, other tints of this material are applied at random and all are worked in together with brush, trowel or sponge. Entire wall is then allowed to dry thoroughly, and is lightly sandpapered. Tinted Stuc-O-Tint should be covered with a coat of Stuc-O-Glaze to be rendered washable. This can be clear liquid, or it can carry a color of its own which can be brushed in and wiped off as described on the following page.

Permanent Stipple with Bradley Stuc-O-Tint

Can be coarse or fine, as desired. Finished with one coat of flat paint (no sizing is needed) and refinished at any time without further stippling. Use Stuc-O-Glaze where two-tone effect is desired.

Two-tone Effects—White Stuc-O-Tint is applied, textured, and sandpapered as described above. It should then be given one coat of Stuc-O-Glaze, which can be colored or tinted with any oil color. While still moist, wipe off all excess color with a cloth, and allow to dry. Stuc-O-Glaze can be applied directly over the material—no sizing is needed. It produces a washable surface, with exceptionally fine high-lights. It is extremely important that Stuc-O-Glaze be used with Stuc-O-Tint for best results.

Blended Effects—These are obtained by applying Stuc-O-Glaze in other colors in a zigzag fashion over the ground coat while it is wet. They are wiped into one another with a cloth or brush until a blend is produced. If more prominent high-lights are desired, wipe over with a clean cloth.

Oil Texture—Linseed oil added to heavily mixed Stuc-O-Tint will produce an excellent oil texture. This may be tinted with any oil color and gives very fine two-tone effects with one application when lightly sandpapered. When blended effects are desired, they may be handled as described in Colored Mixtures, Blended.

Directions for Using Stuc-O-Tint

Mixture—Mix 10 lb. of Stuc-O-Tint to a gallon of water for a medium texture or heavy stipple. If a finer stipple is required, use more water; for heavier texture, use less water.

General—If to be used immediately, mix with warm water and allow to cool before applying. If mixed with cold water, it should be allowed to stand 12 hours so that all the ingredients will have time to dissolve. Water should not be colder than 70° F.

No Sizing—Stuc-O-Tint requires no sizing of any surface before applying. It is not necessary to size the Stuc-O-Tint surface when Stuc-O-Glaze is used for finishing coat. Everything necessary to stop suction is in the materials.

Application—Stuc-O-Tint after being mixed with water will not change in consistency and can be easily applied to any surface and textured. Anything that will make an impression upon wet Stuc-O-Tint surface may be used as the medium to produce the texture desired.

Covering Capacity—Stuc-O-Tint will cover an average of 5 to 20 sq. ft. to a pound according to density of texture or stipple used and surface upon which it is applied.

Specifications for Stuc-O-Tint Standard Finishes

Stipple, Flat Paint Finish—Apply one coat Stuc-O-Tint mixed according to manufacturer's directions and stipple. When dry, sandpaper surface to remove sharp points and apply one coat of flat paint (specified), tinted to (any desired) color. No sizing is needed.

Texture Finish—Two-tone—Apply one coat of Stuc-O-Tint mixed according to manufacturer's directions, and while wet, texture surface (with brush, sponge, trowel, or any tool necessary to get desired texture). When dry, sandpaper to remove sharp points and directly apply one coat of Stuc-O-Glaze tinted (to desired color) in accordance with manufacturer's directions, and wipe with cloth. No sizing is needed.

Blended Colors—Apply one coat of Stuc-O-Tint mixed according to manufacturer's directions, and while wet, texture (as specified). When dry, sandpaper and directly apply one coat of Stuc-O-Glaze tinted to (desired color). While this surface is wet, spot (selected colors) upon same in (zigzag) fashion, wipe into one another with cloth or brush until a blend is produced. (If more prominent high-lights are desired, wipe over surface with a clean cloth.)

Tinted Finish—One Color—Apply one coat of colored () Stuc-O-Tint as supplied by the manufacturer; or tinted () with (dry color before mixing) (dry color dissolved and added to mixture as recommended by manufacturer) (oil or water color added to mixture). When dry, sandpaper lightly to remove sharp points.

Two or More Colors—Apply one coat of (color) Stuc-O-Tint (specifically as in preceding paragraph), and while still wet, apply (colors) mixtures and blend (as per instructions). When dry, sandpaper lightly.

Bradley Stuc-O-Glaze

Bradley Stuc-O-Glaze is a prepared finishing liquid, transparent and emulsified, to be applied over Bradley Stuc-O-Tint, without sizing. It produces a washable surface with prominent high-lights, two-tone and blended effects. May be colored or tinted with oil colors. Is easily applied and wiped.

Bradley One-Cote-Wite

Bradley One-Cote-Wite is a white paint which can be furnished in powder or mixed form. It can be applied with kalsomine brush or spray. Adheres closely, will not discolor, and does not rub off. Produces a dense white effect with one coat. May be colored or tinted as desired. Recommended for industrial plants, garages, basements, and especially adapted for use on concrete and rough plaster, as well as wood and brick-work exposed to dampness or the elements.

Bradley Crack Filler

Bradley Crack Filler is for use on wood, plaster, wallboards, etc. It unites with surfaces and dries without pulling away. Easily worked. Tough and durable. Especially recommended for joints in all wallboard installations.

Service Department

The manufacturers will gladly co-operate with architects by providing samples of the material, finished boards, and exact specification details. They do not apply Stuc-O-Tint but they will be glad to assist the architect with expert supervision of the work whenever practicable.

DURALITH CORPORATION

521 Fifth Avenue, NEW YORK, N. Y.

DURALITH (CANADA) LIMITED, 1502 St. Catherine Street, MONTREAL, QUEBEC

SALES AGENTS

LOS ANGELES, CALIF., J. E. LEININGER, 316 Commercial Street

SYDNEY, AUSTRALIA, S. G. FEIN

EXPORT AGENTS TO LATIN AMERICA: GALBAN & Co., 82 Beaver Street, NEW YORK, N. Y.

FACTORIES AT BROOKLYN, N. Y. and THREE RIVERS, QUEBEC, CANADA

Products

DURALITH—a decorative wall texture consisting of a blend of minerals with casein as the binding agent. Powder form for mixing with cold water.

DURATINT—a high-grade color concentrate solvent in water for pastel shades on textured walls.

Also **Duraglaze**—an oil and wax glaze (neutral and six colors) for textured walls. Also **Durasand**—an extra fine quality fast color sand (six colors) for blowing on textured walls.

How Furnished—Packed in 25, 50 and 100-lb. paper-lined burlap bags and in 1-lb. sample boxes.

Duratint

A new Duralith product. It is pure color finely ground in paste form, soluble in water (50 to 1) and made in a wide range of colors. Duratint is low in price and is undoubtedly one of the cheapest mediums for tinting textured walls yet produced. Applied with a spray gun—electric or hand—singly or in combination of colors while the texturing material is still wet and in plastic condition.

Many pastel shades are obtainable by blending Duratint colors. Duratint in combination with Duralith eliminates five operations and results in a textured wall at a cost comparable with paint and wallpaper.

Furnished in twelve colors in concentrated form, 2-oz. and 8-oz. bottles—2 oz. will make a tinting solution which is sufficient for the average room.

Specification (Short Form)

"The Painting Contractor [Plastering Contractor] shall apply Duralith [Duratint] pure and unadulterated as manufactured by and according to directions of DURALITH CORPORATION, New York, N. Y. Samples showing texture and color scheme shall be submitted to the architect. Approved samples shall be marked and hereby become a part of these specifications."

Samples and Co-operation

Samples of Duralith and Duratint furnished on request. Our Service Department will be glad to co-operate in the creation or development of special effects to suit individual requirements.

Duralith, the Modern Wall Texture

Duralith is unexcelled because of its ease and simplicity of application. Under the direction of the architect the beautiful textured effects to which this unique wall treatment lends itself are innumerable. Recommended for homes, offices, theatres and public buildings. The finish is permanent, reducing maintenance costs to a minimum.

Outstanding Features—

- (1) Mixes readily with cold water.
- (2) Works easily with brush or trowel.
- (3) Requires no slaking.
- (4) Will not sag.
- (5) Does not stain woodwork.
- (6) Very opaque; splendid covering and "hiding" capacity.
- (7) Unaffected by heat or cold.
- (8) Dries in 24 to 48 hours.
- (9) Easily and quickly cleaned.
- (10) Color combinations can be changed at any time.

Covering Capacity—On White Plaster and Smooth Surfaced Wallboard—9 to 20 sq. ft. per lb. On Brown Mortar (floated) or Rough Textured Wallboard—8 to 12 sq. ft. per lb. (Note: No size is required for wallboard unless particularly specified by the manufacturer thereof.) On Metal Surfaces, Kalamien Doors, etc.—About the same as on white plaster.

Mural-Tex—For Textured and Relief Decoration

The color plates featured on this page are photographic reproductions of actual wall surfaces decorated with Mural-Tex.

MURAL-TEX is a product of modern invention and modern manufacture by which a most interesting and unusual array of decorative wall effects may be obtained. With it the period plaster walls of France, Italy, Spain, England and America may be faithfully reproduced. In addition it offers unusual opportunities for original expression. With each new application of MURAL-TEX some new textural effect evolves.

Effects Obtainable—The color plates featured on this page are photographic reproductions of actual wall surfaces decorated with MURAL-TEX and will serve as examples of the many novel treatments in both texture and color that can be readily developed with MURAL-TEX and appropriate coloring materials. In fact, texture and color are, so to speak, incidental details subject to individual expression.

Adaptability—Particularly adaptable for the decoration of interior walls and ceilings. The finer textures and less pronounced color effects are most appropriate for use in the home, and the more rugged designs and bolder color tones are generally employed for decorating the broader areas of wall surfaces in hotels, churches, theaters, clubrooms, lodges, public buildings and other edifices.

Application—Manufactured in dry powder form and simply requires mixing with ordinary cold water to prepare it for use. The mixture is applied with a wall brush and the texture developed by manipulating the surface. The surface is then colored and glazed by simple processes.

Uniformity—MURAL-TEX is manufactured under carefully supervised processes which insure a uniform product of unvarying quality. It is produced by an organization with thirty-five years experience specializing in the manufacture of decorative wall coatings and kindred products.

Hi-Tex Textural Finish

HI-TEX Textural Finish is especially designed for use where economy is one of the deciding factors. It makes possible decorative effects in texture and color that are distinctive as well as attractive and produces these effects economically. It embodies all the essentials that go to make a good decorative medium at a cost well within the limitations of the average purse. Manufactured to a uniform scientific standard of established quality, it provides a decorative medium that makes it possible to achieve beauty and good taste in interiors at moderate cost.

Wall Coatings and Cold Water Paints

Muralo Sanitary Wall Coatings—High Grade Kalsomine

The ideal material for decorating interior walls and ceilings in all manner of residences and public buildings, where harmonious color treatments are essential factors.

Composition—Muralo Sanitary Wall Coatings are manufactured in dry powder form from the best selected raw materials, and compounded in such a manner that they require only mixing with either cold, warm or hot water, whichever is most convenient, to prepare them for immediate application over plaster, wood, burlap or any of the various wall boards.

Expert supervision over all manufacturing processes insures a uniform product that always meets the most exacting of decorative requirements.

Decorative Value—No matter what the style, the general treatment or proposed color scheme for a room may be, Muralo shades harmonize perfectly. They adapt themselves to any type of decoration, from the plain, severe Colonial to the highly ornate.

The deep subdued colors, the range of dainty, delicate tints with their rich velvety finish, devoid of gloss or glare, create an atmosphere of elegance, distinction and refinement, adding new charm to the cottage and mansion alike. The possibilities for soft blending of tints and shades and artistic harmonizing of colors are unlimited.

Muralo Wall Size

Preliminary treatment of wall surfaces prior to applying wall coatings in general is very essential.

A priming coat of Muralo Wall Size produces a perfect foundation and insures the successful outcome of the completed work. Compounded in dry powder form and is ready for use when dissolved with boiling water.

Indelible Exterior Cold Water Paint

A perfectly blended, smooth, fine-spreading paint mixture, which possesses all the adhesive and covering properties of oil paint at only a fraction of the cost. In addition it has fire-retarding properties of recognized value. Furnished in 18 standard colors, white and black.

Composition—Manufactured in dry powder form from the most durable and lasting paint pigments, combined with certain cementing and waterproofing compounds, and so treated by certain processes that it is at once soluble and ready for use when mixed with ordinary cold water, forming a durable cold water paint which has remarkable weather-resisting qualities.

Adaptability—Especially designed for painting the exteriors of factories, warehouses, and all types of industrial buildings. In the larger cities it is used extensively for the painting of airshafts and courtyards of apartment buildings and tenements, due to its sanitary and light-reflecting properties. In the country and farming sections it provides a means of painting farm buildings at a relatively low cost as compared with oil paint.

King's Perfected Interior Cold Water Paint

A high grade paint for interior surfaces, snow white, sanitary, fireproof and light-reflecting.

Composition—Manufactured in dry powder form, under improved processes that make possible the economic production of a cold water paint.

Ready for immediate use when mixed with cold water, and may be applied with brush or spraying machine.

Adaptability—Particularly adaptable for painting the interiors of factories, warehouses and all types of industrial buildings where the cost of oil paint is usually considered prohibitive.

Samples, Literature

Samples of our several products, descriptive literature and further information pertaining thereto will be cheerfully furnished on request. Correspondence invited.

Specifications

Directions for mixing and applying our products are given in detail in our "Mixing Directions" circular, a copy of which is inserted in each container of the respective products.

Color Chart of Muralo Sanitary Wall Coatings

Muralo Sanitary Wall Coatings are milled in the 18 light tints featured on the accompanying color chart, 12 deep colors, white and black.

By intermixing the white with the tints and deep colors or intermixing the tints and deep colors an infinite variety of intermediate shades may be developed to suit individual requirements.

LAUX WALL TEXTURE—A PLASTIC PAINT

MANUFACTURED BY
I. F. LAUCKS, INC.

314 Maritime Building
SEATTLE, WASH.

CHICAGO, ILL., B-33 Builders Building

LOS ANGELES, CAL., 816 Architects Building

EXHIBIT: BUILDERS EXPOSITION, 228 No. LaSalle Street, CHICAGO, ILL.

A PLASTIC PAINT MADE BY CHEMISTS AND APPROVED BY ARCHITECTS AND DECORATORS

Laux Wall Texture enables the architect to obtain for his interiors just the textured effect desired with the knowledge that the finished job will be permanently satisfactory to the client. It insures a uniform job—something not often obtained when textured wall finishes are prepared by using a painter's "private formula."

Whatever type of architecture—whether it be English, Spanish, Colonial, Italian—with Laux Wall Texture interior walls may be made to harmonize in spirit of treatment with the architectural theme of the whole structure. Textures may range from the lightest and most delicate to the heaviest.

Specific Advantages

Ready Mixed Colors—Comes in seven ready mixed colors, beautiful pastel shades. These may be blended into tiffany effects giving soft water color tones. Finished walls have no gloss but are restful and pleasing. Where washable finish is desired, Laux Wall Texture may be painted and glazed in any manner desired. Stencil and relief effects are readily and economically obtained.

Unvarying Uniformity—Made to a precise formula. No variations in color or quality. Uniform results assured.

Adheres Firmly and Is Durable—Laux Wall Texture can be applied over and will adhere to old or painted walls as well as new. Its marble base gives it extreme durability, and even when struck with a hammer it does not chip or crack.

Economical—Its ease of mixing, application and texturing make it an economical material which will not throw cost schedules out of line.

Proven in Use

Laux Wall Texture has given satisfaction on jobs ranging from modest homes to such interiors as: Pierce Arrow Auto Sales Room, Brooklyn, N. Y. Publix Theatres, Chicago and Aurora, Ill. Lankershim Hotel, Los Angeles, Cal. Y. W. C. A., Tokyo, Japan Yellowstone National Park Hotel, Yellowstone Park, Wyo. Medical Dental Building, Vancouver, B. C. and many others.

Architects' Short Form Specifications

The wall and ceiling surfaces noted in the schedule below shall receive proper surface preparation and shall be finished with Laux Wall Texture delivered in unbroken original packages. Both surface preparation and application shall be according to the directions furnished by I. F. LAUCKS, Inc., manufacturers, which directions are made part of these specifications. Sample panels for texture, color and finish shall be developed in the actual material and submitted to the architect, subject to his approval before beginning work. Duplicate samples of the panels accepted are to remain on file at the architect's office.

Schedule—Under schedule the following should be noted:

- (a) Room name or number and sample panel corresponding.
- (b) Whether walls or ceiling or both are to be finished.
- (c) Texture as light, medium or rough.
- (d) Whether material is to be in manufacturer's colors or painted.
- (e) Whether finish is to be glazing liquid or some other finishing medium.

PLASTEX, THE PERFECT PLASTIC PAINT

Description

Plastex is a white plastic paint of the dry powder type made ready for use by simply mixing with cold water to a stiff pastelike consistency. With Plastex, any of the textures so popular in the past ages and in such vogue now may be perfectly reproduced at little cost.

Plastex lends itself to an unlimited variety of texture effects, ranging from the finest stipple to the roughest antique. Italian, Old English and Gothic plaster, Greek, Spanish, Moorish, Early Colonial, Travertine and Caen Stone are simply and economically reproduced with Plastex.

Covering Capacity—Five pounds of Plastex powder when mixed with water will cover 5 to 10 sq. yd. depending upon the texture desired. For coarse textures it is applied heavier.

How to Prepare Surfaces for Plastex

Plastex may be applied over practically any rigid, interior surface that can be painted, kalsomined, or papered. It is important to follow these simple instructions in order to obtain best results. All surfaces must be clean and dry, free from grease, dirt, scaly paint, kalsomine and stains. Aniline stains must be coated with aluminum paint to prevent bleeding through.

Plaster Surfaces—Either Keene's cement, hard smooth finish putty coat, sand finish plaster, or brown coat walls and ceilings, when thoroughly clean, dry and free from grease, dirt and stains, ordinarily need no preparation. When excess amount of suction is present, they should first be given a coat of Plastex Size or a coat of thin shellac or shellac substitute. Cracks, joints and holes should be patched with Plastex Paste but be sure that the patched places are thoroughly dry and sized before applying Plastex.

Painted, Varnished or Enameled Surfaces—All loose paint scales should be scraped off. It is particularly important that painted, enameled and varnished surfaces are free from dust, dirt, grease and scaly paint. If in doubt about being thoroughly clean, use a good paint cleaner and follow manufacturer's directions. Then apply one coat of Plastex thinned to the consistency of thick cream like kalsomine. Allow to dry before applying Plastex at regular consistency.

Plaster or Pulp Wall Board—Wall board usually comes from the manufacturer already sized but when not, it should be given a coat of Plastex Size after all joints have been filled and nailheads covered according to the wall board manufacturer's specifications. Before applying Plastex, the material used for filling joints and nailheads must be dry and, if rough, sanded down, then Plastex may be applied at regular plastic consistency.

Kalsomined and Papered Surfaces—Wash off kalsomine, fill all cracks and make sure that the surface is clean and dry. Follow instructions under heading "Plaster Surfaces." Application of Plastex over wall paper is not recommended. It is best to remove wall paper and treat walls as outlined under heading "Plaster Surfaces."

Masonry and Brick Surfaces—Plastex may be applied to interior masonry and brick surfaces when they are dry, free from dust, mortar and dampness. First use Plastex Size to stop suction; do not attempt to use Plastex over a brick or masonry surface if damp. If the surface requires pointing, use a heavier mixture of Plastex the same as you would patching plaster.

Unpainted Wood Trim or Other Wood Surfaces—Before applying Plastex to such surfaces they should be coated with shellac or varnish size. When the wood surface has been painted, follow directions under the heading "Painted, Varnished or Enameled Surfaces."

Metal, Glass and Other Non-porous Surfaces—Such surfaces must be thoroughly clean and free from dirt, grease

and wax. Two coats of Plastex are necessary—a thin coat first and a second coat of regular consistency.

Fabric Wall Hangings—Plastex is not recommended for application over fabric hangings unless they are thoroughly bound to wall. It is best to remove hangings and follow instructions under "Plaster Surfaces." Sanitas, Lin-crusta and other glossy finish products should

have gloss cut through by washing with a paint cleaner. Wash clean with clear water and allow to dry before applying Plastex.

Glossy, Waxed Surfaces—Follow instructions under "Plaster Surfaces" but make sure the wax is all removed. This is best accomplished with a mixture of equal parts naphtha and carbon tetra chloride. Walls so treated must be sized before application of Plastex.

Caution: Do not use glue or paste size under Plastex.

How to Mix Plastex

Use clean metal containers. Pour cold faucet water into container and add Plastex Powder gradually while stirring. Stir thoroughly until free from lumps and mix to a heavy consistency. Let stand for at least 30 minutes and it is ready for application. If hot water is used, allow to cool before applying. Do not mix more Plastex than required for a day's work. If any is left over, saturate a cloth with water and lay it directly on top of mixture. Pour a small amount of water on top of cloth to keep it moist overnight. Before using again remove cloth and any skins and stir thoroughly.

Caution: If Plastex is allowed to stand over two nights in a mixed condition, more dry Plastex Powder must be added before using.

Coloring and Tinting—Plastex comes in white only but may be tinted with any dry limeproof pigment color. Do not use over 7% of dry color. Added colors must be mixed with water separately to a heavy paste form and then mixed with Plastex in its plastic form. Avoid the use of chemical or aniline colors. Always use same proportion of Plastex and colors to obtain uniform tints. For this reason it is best to prepare enough Plastex for the entire job to insure uniform shade.

How to Apply Plastex

The application of Plastex is simple. Use a clean brush. On large surfaces, a Dutch kalsomine brush is best. Plastex should be laid out on the surface in a fairly even coat, from $\frac{1}{8}$ to $\frac{1}{4}$ in. thick. Shortly after application, it is ready to texture. A sponge, wall knife, scraper, etc., may be used.

Tips on the Application of Plastex—During application wood work and trim may be protected by using gummed tape or Plastex should be washed therefrom with sponge and water before it sets up. Close doors and windows to insure normal temperature during application and open for free circulation of air after Plastex has been applied. The work is best accomplished by two men—one to apply and the other to texture the Plastex.

Decorator's Accessories

Plastex Size and Sealer—A casein size to be used in conjunction with Plastex Plastic Texture Paint.

Reardon's Wall Size—A hot water soluble size. Excellent as a first coater or primer under paint and enamel and for sizing preparatory to kalsomining and wall papering. Positively kills stains, stops suction and neutralizes lime.

Roco Wall Size—Same as Reardon's Wall Size only cold water soluble.

Reardon's Water Putty—For filling cracks and damaged and cracks in plastered surfaces. Does not shrink or crack.

Reardon's Water Putty—For filling cracks and damaged places in wood, stone, plaster and metal surfaces. Sets extremely hard.

MODEX, THE MODERN PAINT

Description

Modex is the latest development in the science of paint manufacture. Its idea was suggested by the paste distemper paints so widely used in Europe, but in developing Modex it was found possible to not only improve the qualities of the European distemper paints, but to compound Modex through a special process in more convenient form.

Modex is marketed in dry powder form instead of the old-fashioned liquid paste and is simply broken up with water, then boiled linseed oil is mixed in and the mixture is thinned for use with additional water. In liquid form Modex closely resembles oil paint in odor, texture and body.

Modex is furnished in white and a variety of tints—packed in barrels of 300 lb. net, drums of 100 lb. net, and 5 lb. cans.

Advantages

Modex is made with the same high-grade opaque pigments that other good paints contain. All of its qualities are in proper balance: Modex flows freely, does not spatter, levels out and dries quickly. Some of its outstanding features are:

Great hiding power	Economical application	Flexibility
Low product cost	Washability	Long life

Modex adheres to damp or dry surfaces; dries with a tough elastic film which will not crack, peel or discolor. When dry it has a velvety flat finish which may be washed with soap and water.

Preparation of Surface

Owing to the great adhesiveness of Modex, preparation of surface is more important than when using other types of paint.

It is absolutely necessary that the surface be clean and firm, for if applied over a scaly or loose undercoating, Modex will lift the undercoating and result in chipping or scaling.

Applied to clean and firm surfaces, it adheres strongly and dries with a tough, elastic and durable film.

The main precaution to take in preparing to apply Modex is to thoroughly remove by washing or wire brushing any old undercoating of glue size, kalsomine, cold water paint or white-wash.

These undercoatings do not provide a sufficiently firm foundation for Modex.

Mixing

To each 10 lb. of dry Modex gradually add 3 qt. of water, stirring as added until mixture is free from lumps.

Then immediately add 1 pt. of boiled linseed oil and, after stirring in thoroughly, add an additional quart of water and stir again until worked in well and mixture is smooth.

Strain through paint strainer.

TEXTONE (THE PLASTIC PAINT) AND ACCESSORIES

TEXTONE

Description

Textone is a plastic decorative material for use over Sheetrock, plastered walls and ceilings, and other surfaces such as paint, canvas, glass, metal, wood, brick and concrete. It affords unlimited decorative treatment, in any desired tint or color.

Textone comes in white powder form, ready to be mixed with water. Textures are obtained with tools employed in everyday use—whiskbroom, stippling brush, sponge, wadded paper—or the palm of the hand.

Textone makes possible walls and ceilings in harmony with the architectural design of any period. Textures with unusual water-color effects, blended tones, grained, stippled and mottled surfaces, and antique effects are easily obtained. With Textone it is possible to achieve attractive caenstone and travertine masonry effects.

The heavy body of Textone produces a splendid opaque finish. One coat of white over a properly prepared surface covers perfectly, thus it is an extremely economical material.

Any color may be obtained by mixing dry pigment colors with the prepared Textone; by blowing in colored sands after the Textone is on the wall; by water glazing with tinted Textone Sealer, or by applying a coat of Textone Glaze which has been tinted with colors ground in oil. Wiping the glaze coat brings out the high-lights and produces striking two-toned effects.

Textone is remarkably adhesive and dries hard.

Package

Shipped in 10-lb., 25-lb., and 50-lb. moistureproof fiber boxes, and in 325-lb. (300 lb. net) barrels.

Covering Capacity

One pound of Textone should cover approximately from 1 to 1½ sq. yds. of surface for a medium texture (slightly more with finer textures).

TEXSAND

Description

A specially prepared silica sand, ground to uniform fineness for obtaining swirl effects in Textone. It is used to produce variegated effects in true color in Textone.

Texsand is sold in white only and is to be tinted with dry color to obtain any desired shade.

Package

Shipped in 10-lb. bags.

GREENSPAR

Description

This material is a finely ground, water floated, natural sand of a greenish color. It is employed with Textone to

produce the color found in the natural pits and markings in travertine stone.

Package

Shipped in 10-lb. bags.

TEXTONE SEALER

Description

Textone Sealer is a specially prepared sealing agent for Textone. The use of Textone Sealer improves the appearance and durability of the completed work, whether used as a protective coat on the finished Textone surface or under the glaze coat.

Textone Sealer is manufactured in dry powdered form and is easily and quickly prepared for use by mixing with water. After mixing, Textone Sealer is a colorless liquid.

Package

Shipped in 1-lb. and 5-lb. packages.

TEXTONE GLAZE

Description

Textone Glaze is a specially prepared, practically colorless glazing liquid for use over textured surfaces. It dries flat to a soft sheen, and gives a durable waterproof finish.

It is used for blended or glazed effects to produce the patina, or age coat, found on the antique rough textured wall surfaces in old buildings in Europe. Where such surfaces have become light in color on the high spots, due to frequent cleaning and to long wear, the original color remains in the low spots, accentuating the uneven modeling of the textured surface. There are also accumulations of moss and dust in the hollows which are sometimes desirable to reproduce for their soft, mellow appearance of age.

Besides the reproduction of antique treatments, numerous rich, two or more toned color and texture effects, such as tiffany blends and polychrome finish, may be obtained.

Textone Glaze is tinted with pigment colors ground in oil or japan.

Container

Shipped in quart and gallon containers.

SPECIFICATION—SHORT FORM

All wall and ceiling decoration not otherwise specified shall be Textone, mixed and applied in strict conformity with the directions of the UNITED STATES GYPSUM COMPANY, manufacturers, which directions are hereby made part of these specifications as fully as if they were set forth here in detail. Panels showing color and texture shall be made by the decorator and submitted to the architect for approval before work is commenced.

Note: List colors and textures selected for walls and ceilings in various rooms.

TEXTONE CEDAR

Description

Textone Cedar is a special Textone (Plastic Paint) composed of inert materials to which is added not less than 8% of cedar wood oil. It is intended for use as a texture paint lining applied ⅛ in. thick over the walls and ceilings of closets as a moth preventive.

When dry, it closely resembles cedar wood in both color and odor. Obviously, no finish of paint or sealer should be applied over the natural, textured Textone Cedar. As in cedar

lined closets, the doors, etc., should be close fitted to seal in the active cedar odor, which is repellent to moths.

Package

Shipped in 25-lb. round metal containers.

Covering Capacity

Approximately one and one-half (1½) pounds of Textone Cedar covers one (1) sq. yd., ⅛ in. thick.

CEMENTICO

(A Cement Stucco Paint)

Description

Cementico is a cold-water, weatherproof, insoluble cement paint for use over such surfaces as unpainted stucco, porous concrete, brick, tile and stone. It is not intended for use on wood or non-porous surfaces such as smooth plaster, terra cotta and enameled brick; or on oily or greasy surfaces.

It is in the form of a white powder to be mixed with water and coloring matter on the job.

An outstanding and almost exclusive advantage is the readiness with which Cementico mixes with water. Because of the absence of "sludge" in the mixture, the usual tedious straining operation is materially lessened. Due to its smoothness and uniform consistency, Cementico paint is admirably adapted to application by spray gun as well as by brush.

Again and quite important, the tendency to "bloom" inherent in most cement-and-lime mixtures, in Cementico has been practically eliminated.

When Cementico is to be tinted, the most lasting results are obtained by the use of U.S.G. Limeproof Colors.

Packages

Cementico is shipped in 25-lb., 50-lb., and 100-lb. round fiber drums and in 300-lb. net weight barrels.

Covering Capacity

One (1) pound of Cementico, applied in one (1) coat will cover 16 to 25 sq. ft., depending upon the texture of the surface to be covered and the heaviness of the application required.

TEXOLITE—A WALL PAINT

Description

Texolite is a paint for use on interior surfaces, such as plastered walls and ceilings, wallboard, concrete, brick and wood. It enters the field between calcimine and oil flat wall paints and combines many of the good features of both.

It dries with a soft sheen, like calcimine, which gives high light reflection, brushes more easily than flat wall paint and is water resistant and will wash as well as some flat wall paints.

Texolite comes in a pure white powder and is prepared for application by mixing with water. It may be easily tinted to any desired shade with limeproof colors and may be applied with a wide brush or spray.

One coat will hide as well as two coats of oil paint. It works well as an undercoat under enamels and flat wall paints and will save one or two coats.

Package

Texolite is shipped in 25-lb., 50-lb., and 100-lb. round fiber drums and in 275-lb. net weight barrels.

Covering Capacity

One (1) pound of Texolite (dry powder) applied in one (1) coat will cover from 25 to 45 sq. ft., depending upon the texture of the surface to be covered and the heaviness of the application.

U.S.G. LIMEPROOF COLORS

Description

Dependable limeproof colors are now available in convenient air-tight packages. The colors are black, raw and burnt sienna, raw and burnt umber, yellow, green, blue and red.

These limeproof colors are to be used for tinting Textone, Em-Bel-Lo and other plastic paints; calcimine, cement paints and other water-mixed products; for tinting Textone sealer; for coloring stuccoes and mortars.

All the colors are lightproof, and most of them are mineral pigments. Many are imported. They are finely ground and have not been "let down" by the admixture of filler.

Package

Packed in two sizes: No. 1 package contains from 12 oz. to 28 oz. of color, and No. 4 package from 48 oz. to 112 oz. The difference in contents of these containers is due to varying density of the colors.

Mixing

To mix, add the dry color to a little water, mix thoroughly to a thin paste, strain through a fine mesh screen to remove lumps, then add to the wet mixed paint or other material.

Caution: The tinted materials will be several shades lighter when dry than when in the wet mix.

RED TOP MORTAR COLORS

Description

Red Top Mortar Colors for coloring masonry mortar, etc. are produced for the UNITED STATES GYPSUM COMPANY by two of the leading manufacturers. The Eastern source is the Clinton Metallic Paint Co., Clinton, N. Y. The Western source is The Ricketson Mineral Color Works, Milwaukee, Wis.

These two products have been made since 1885. They are Pure Mineral Colors of high quality, noted for their fineness and uniformity in strength and shade.

The colors are standard in the industry. Red Top

Mortar Colors will be furnished in Red, Light Buff, Dark Buff, Brown, Double Strength Chocolate, Standard Black, and Double Strength Black. Special colors will be furnished on order.

For further data, see Clinton Metallic Paint Co.'s and Ricketson Mineral Color Works' catalogues in Sweet's.

Package

Shipped in 100-lb. waterproof, paper-lined nonreturnable jute bags.

H. B. WIGGIN'S SONS CO.

Manufacturers of Rufkote Plastic Stone

233 Arch Street, BLOOMFIELD, N. J.

BRANCH OFFICE: 4860 South Halsted Street, CHICAGO, ILL.

Products

RUFKOTE PLASTIC STONE for interior walls and ceilings.

WIGGIN'S SIZEKOTE.

WIGGIN'S GLAZEKOTE.

For page on Fab-Rik-O-Na Cloth Wall Coverings, see Manufacturers' Index.

TRADE-MARK

Wherever suction is likely to occur, the surface should be sized with Wiggin's Sizekote before putting on the Rufkote. Wall boards that have not been sized in manufacture should also be given a coat of this size.

Rufkote—Plastic Stone for Interior Walls and Ceilings

Rufkote is plastic stone. For the finishing of walls where the decorative requirements suggest rough plaster or stone surfaces, it affords a ready resource of the most agreeable quality. A white powdered mineral, it is free from any animal matter and, when mixed with cold water, it becomes a texturing paint of heavy consistency. Not only is it a medium that lends itself readily to manipulation while being applied and fully plastic but, as it sets absolutely without shrinkage, there is no element of chance about the surface texture whose final appearance remains exactly the same as upon first application. Packed in 250-lb. barrels, 100-lb. kegs, 40-lb. pails, 100-lb. and 25-lb. bags.

Rufkote will not fade colors, nor will it set up adverse chemical reactions in paint pigments applied over it.

The exact colors desired may be obtained by mixing in either dry colors or colors ground in oil.

Application of Rufkote

Rufkote may be applied over plaster surfaces, either directly over the brown coat or on the finished white coat. It may also be applied over brick, concrete, wall board, wood or any other material commonly used for wall or ceiling construction.

Wiggin's Sizekote—A Cold Water Size

For sizing and sealing surfaces upon which Rufkote is to be applied and for sizing the textured Rufkote before glazing. Sizekote penetrates, stops suction, brushes out freely and is rapid drying.

Packed in 1, 5 and 25-lb. sizes.

Wiggin's Glazekote—A Transparent Finish for Rufkote Surfaces—Easily Colored

A transparent glaze for finishing Rufkote surfaces. Dry pigments or oil colors may be mixed with it. It is used in producing wiped or blended color effects and makes a tough waterproof finish with an eggshell gloss, adding beauty and character to the texture. The Rufkote should be given a coat of Wiggin's Sizekote before glazing.

Packed in gallon cans and quart cans.

Distribution

Stocks of Rufkote products are carried at Bloomfield, N. J., and Chicago, Ill. Deliveries may be obtained from our jobbing distributors in prominent centers throughout the United States.

Service and Literature Available to Architects

We seek the opportunity to co-operate with architects and offer them the services of our experts regarding the proper use of our products.

We shall be glad to furnish on request a copy of our "Text Book of Textures" by F. N. Vanderwalker and folder of literature and samples of Wiggin's products. Also samples of Rufkote powder and finished boards.

All requests for information will be promptly answered.

Short Specification for Architects Use

All walls and ceilings shall be finished with Rufkote Plastic Stone as manufactured by the H. B. WIGGIN'S SONS CO., Bloomfield, N. J., in approved texture, color and *..... finish. Prepare Rufkote and treat all surfaces in accordance with instructions supplied by the manufacturer.

*Note: Here indicate texture by name such as Roman Travertine, Spanish Palm Finish, etc.

Textures Obtainable with Rufkote Are Unlimited

FREDERIC BLANK & COMPANY

SALUBRA WALL COVER COMPANY

New York Central Building
NEW YORK, N. Y.

24 North Wabash Avenue
CHICAGO, ILL.

Salubra Is "Oil Paint-by-the-Roll"

Salubra is a wall covering which, in one operation, completes and decorates the structure of an interior wall.

Salubra consists of oil paint on a tough parchment background—"Oil Paint-by-the-roll." It is applied to the wall as easily and as speedily as wallpaper. It supplies color and decorative value, yet has all the sanitary and protective qualities of paint and adds to these a durability and washability that make it extremely practical.

Born in the laboratory, Salubra is the result of years of research and experimentation by prominent European scientists. They created this ideal wall covering by combining utility with beauty—perfecting all the favorable features of paint, its protection and sanitation, with the beauty and warmth of wallpaper—without the disadvantages of either.

Protects the Wall Surface

Salubra's strong parchment background offers an additional protection to the plaster, reduces to a minimum the breaks in the plaster surface, and prevents it from crumbling. It acts as a sort of *protective veneer* to the plaster.

Salubra eliminates the unsightly appearance of fire cracks so common in painted wall surfaces, whether new or old. It seals the pores of the plaster, becomes part of the structure and covers its defects. Unaffected by climatic conditions, Salubra neither peels nor scales. It is the modern method of treating walls.

Because it is not in direct contact with the plaster, Salubra's paint surface not only wears better but gives the wall finish a softer, warmer appearance. For the same reason, the color values of Salubra do not change through the action of ingredients of the plaster.

Durability That Approaches Permanence

When applied to the wall, Salubra is almost as permanent as any structural material you specify. Without losing its original freshness, color or lustre, it will remain there for 10 or 15 years, or as long as you choose to keep it. In thousands of European hotels, hospitals, homes and royal palaces, actual records show that

Salubra
REG. U. S. PAT. OFF.

won't fade—will wash

Salubra still retains all its original charm after 15 or more years of continuous service.

Hundreds of Beautiful Designs from Which to Choose

Architects and interior decorators find in Salubra a range of patterns and colors adapted to every type of interior—designs created by leading European artists.

Owing to the uniformity of the texture of its surface and the high quality of its oil colors which are on the base of zinc, a Salubra painted wall radiates a feeling of softness and warmth which is characteristic and possible only through mechanically perfect workmanship.

Salubra dresses the wall. It creates a new luxury in interiors, which permits the architect to complement the interior in complete harmony with the entire structure.

Selection of color or design "in the roll" permits the architect to visualize the finished surface of the wall while the project is still in plan form.

More than two thousand distinctive and colorful patterns await your choice.

Salubra Cannot Fade

The oil colors of Salubra have been specially compounded to resist the action of light and climate. They are unaffected by strong sun-

light, artificial light, heat, cold, moisture or dryness. Salubra may be used anywhere and is being used in the tropics, mountain resorts, at seashore hotels, in cities where smoke and soot abound, and in country homes.

The durability of Salubra, combined with its fadelessness, is *insurance against depreciation*. It keeps the walls for a number of years as you planned them and saves your client considerable money and inconvenience through the elimination of periodic redecorations.

Salubra Is Easily Cleaned

Salubra's non-porous, non-absorbent surface simplifies its upkeep. After a certain length of service, scrubbing with a brush, soap and water restores the room to its original freshness and beauty. Cleaning the Salubra-decorated walls is a simple, easy process even for the unskilled.

Scrubbing with Soap and Water Cleans Salubra

FEATURES AND ADVANTAGES OF SALUBRA WALL COVERING

(1)
Has all the protective and sanitary advantages of paint.

(2)
Has all the favorable features of the finest wallpaper in colorful and distinctive designs—2000 from which to choose.

(3)
Is non-porous, waterproof, and resists the absorption of dust, soot and odors.

(4)
Upkeep is the simplest. Scrubbing with brush, soap and water removes spots and restores all the original beauty of coloring and design.

(5)
Cannot fade under exposure to sun or artificial light—permanent oil colors on waterproof parchment paper.

(6)
Unaffected by heat, cold, moisture or dryness.

(7)
Vermineproof—hygienic. Sanitary properties have been attested by Institute of Hygiene of London and University of Basle, Switzerland.

(8)
Saves time. Completes the structure of the wall and decorates it in one operation.

Sample to Show Character, Texture and Quality of Oil Colors
2000 decorative patterns available

This ease of cleaning is due to the composition of Salubra—the fact that it is non-porous and non-absorbent. Dirt and dust remain on the surface. Since Salubra is waterproof, liquids do not penetrate it. The coloring that causes stains stays on the surface and is removed by washing. Stains that ruin ordinary wall finishes do not affect Salubra. Local spots are removed without injury by applying corresponding solvents. Any cleanser that does not affect textiles (linen sheets) can safely be used in removing spots from Salubra. This washability of Salubra makes for unsurpassed economy of maintenance.

Salubra Is Sanitary

Salubra contains no arsenic or other health-impairing chemicals. Its characteristic surface provides minimum opportunity for germ growth or dust absorption. It does not retain smoke or odors. Exhaustive tests conducted by the University of Basle, Switzerland, have proved that vermin and household insects cannot live on Salubra. Salubra may be washed with many disinfectants without injury.

The exceptional sanitary features of Salubra won for it the *Certificate of the Institute of Hygiene of London*. It is used extensively in many leading European hospitals and sanitariums.

Easily and Quickly Applied

Salubra, though a permanent decoration, can be handled and hung in the same manner as other good wallpapers. Any good paperhanger can do the work.

Reduces Final Costs of Wall Decoration

Salubra typifies "the economy of quality." Salubra's initial cost is not higher than good wallpaper or paint and its long life makes its final cost a great deal less.

The average wall is redecorated every two and a half years. For comparison, suppose we consider only ten years as the life of Salubra. In that time an ordinary room would need redecorating four times as compared with once for the Salubra-decorated room. On this basis, Salubra (1) saves the cost of three additional wallpaper or paint bills; (2) saves the cost of three expensive labor charges; and (3) saves the annoyance and inconvenience of redecoration, as well as lost revenue where rooms are rented and must be vacated during redecoration.

But—ten years is by no means the maximum life of Salubra as our records show many instances where Salubra is still in service after fifteen and even twenty years and more. Considering this and the low maintenance cost, the economy of Salubra is almost beyond comparison.

Unique Features Adapt It to All Types of Buildings

Salubra's beauty, the distinctive atmosphere it creates, its economy, its permanence and the speed with which it is applied adapt it to every type of building. Among its users are hotels, clubs, apartments and apartment hotels, restaurants, institutions, hospitals, offices and residences. Each finds in Salubra advantages combined in no other one wall decorating medium.

Co-operation with Architects

In almost every city are Salubra installations which may be seen. Our showrooms are at your disposal for the selection of patterns. You are invited to submit your problems; in solving them, we place at your disposal the *practical experience gathered during thirty-five years in wall decorating problem under the most varied conditions in all parts of the world*. References and endorsements of users will gladly be furnished on request.

COLUMBUS COATED FABRICS CORPORATION

Manufacturers of Wall-Tex—Oil Coated Fabric Wall Linings and Decorative Wall Coverings

COLUMBUS, OHIO

Decorative, Durable and Washable Wall Coverings

Wall-Tex is an oil coated washable fabric. It is offered in designs to harmonize with every scheme of interior decoration.

Wall-Tex Lining Cloths are used as a background for paint work, stippling, fresco painting and stenciled panels. Or the walls may be covered in a decorative manner with a finished Wall-Tex design. After years of service, the finished design can also be used as a foundation for further painting and decorating.

Wall-Tex strengthens plaster and permanently hides plaster cracks in old walls and ceilings. Being somewhat elastic, it stretches slightly where necessary and prevents new cracks from showing through the surface. The surface of Wall-Tex is easily washed clean.

Wall-Tex Lining Cloths—An Excellent Base for Paint Work

The highest grade fabrics and finest oil coatings provide an even, unbroken background for paint work and thus give the effect of high class painted canvas at very low cost.

Wall-Tex Lining Cloth No. 3099—A three-coat foundation for further paint work. Especially adaptable where paint coat must exactly match shades in woodwork.

Wall-Tex Lining Cloth No. 3098—A dull, smooth white cloth especially desirable for paint work, tiffany finishes and stenciled paneling.

Wall-Tex Lining Cloth No. 3000—A dull, embossed white cloth (see sample) that can be used without further decorating or as a base for any

The Result of Thirty Years' Experience in Making Coated Fabrics

"Wall-Tex" No. 3000

Can be used as a finish or as a base for any kind of decoration

Decorative Wall-Tex No. 3802

A dull finish number which adds color to the bathroom. Glazed finish is No. 3304

Decorative Wall-Tex No. 3910

Wall-Tex offers this pleasing and cheerful nursery pattern

kind of painted finish. Will give a slightly rougher result than 3098.

Wall-Tex Lining Cloth No. 3097—A stiffened canvas that makes a splendid foundation for paint with a result that looks like a stipple or canvas effect.

Wall-Tex Wall Coverings for Living Rooms, Dining-rooms, Bedrooms, Baths and Kitchens

The finest oils and pigments are used over highest grade fabrics to insure walls of lasting beauty and economy. There are many Wall-Tex designs for every room—a complete selection of plain, decorative and colorful patterns in dull and glazed finishes.

Important: This product is made by one of the largest manufacturers of strictly oil coated fabrics in the world—by men who know how.

Applied in Same Way as Wall Paper

Old walls should be cleaned, cracks filled and surfaces sanded. When walls and ceilings are prepared, dried and sized, Wall-Tex Lining Cloths and Decorative Wall Coverings are then applied in the same manner as ordinary wall paper, using a good quality flour paste. Edges are butted together and rolled down with felt roller.

Product

SANITAS MODERN WALL COVERING, the original washable cloth wall covering.

Description of Sanitas

Sanitas is a cloth wall covering finished in durable oil colors. Four coats of paint are smoothly and evenly applied to the fabric back by machines, and subsequently dried in large heated cells. This oil color surface is non-absorbent and repels dirt and grease stains.

The tensile strength of the finished material is 40 pounds per square inch in the warp and 30 pounds on the average woof.

Sanitas Varieties

Sanitas is available in over 140 designs in plain or printed dull and enamel finishes, suitable for any interior, either as a finished decoration or as a ground for glazing, stenciling or decorative mural work. Sanitas Embossed Metalline Brocade makes an interior of great richness wherever a metallic effect is desired.

Plain Flat Finish—A fine selection of pastel and solid tones where plain walls or ceilings are desired.

Decorative Flat Finish—A splendid selection of florals, damasks, foliage, Toile de Jouy, colonial, plastic and air brush blend effects.

Enamel Finish—For bathrooms, kitchens, etc., in modernistic and conventional styles; also made in a fine variety of plain colors.

Metalline Brocades—Cannot be surpassed in richness of tones and durability by any other material. Made in all the popular shades obtainable in silk damasks.

Sanitas Standards of Measurement

Sanitas is made in 12-yard rolls, 48 inches wide, each roll covering 144 square feet or 16 square yards. One of these rolls covers the same superficial area as 4 rolls of wall paper.

The 48-inch width of Sanitas reduces the number of seams on walls and ceilings.

Advantages of Sanitas

Washable—Dust and finger marks on the wall may easily be removed with a sponge or soft damp cloth.

TRADE-MARK

Flexible—The cloth back protects wall cracks, due to plaster shrinkage, from breaking through Sanitas.

Permanent—There are many instances where Sanitas has been on the walls for 12 and 15 years, the only upkeep cost being that of washing off frequently with a damp cloth or sponge.

For All Types of Buildings—The wide range of styles, from the rich Metalline Brocades to the self-toned effects in dull or glazed finish make it possible to employ Sanitas in the decoration of homes, apartments, hotels, schools, offices, hospitals and steamships.

Adaptable—Sanitas has been used successfully in tropical countries and climates where moisture abounds. Sanitas can be applied to any flat surface. Can be used to cover boards or temporary partitions very satisfactorily, due to the strong cloth back on which the goods are made.

Easy to Apply—Sanitas can be hung by any good wall paper hanger. No special paste is required.

Sample of Sanitas in Decorative Flat Finish

Complete Sanitas Sample Book

A sample book showing the entire line of 140 styles will be sent to any architect free on request.

Specifications for Hanging Sanitas (Condensed)

Prepare all plastered surfaces by carefully cutting out and filling all cracks smooth and flush with the plaster plane.

Prepare a glue size by soaking 1 lb. of white ground glue in cold water, add 12 quarts hot water and 1 tablespoon of alum. Apply hot with a paste brush.

Trim the edges of the Sanitas perfectly straight and true with a sharp knife using a long

metal faced straightedge. Paste the back of the goods with any standard paste used by paper hangers, working the paste thoroughly into the fiber of the fabric. Butt the edges to a straight true tight joint and press and smooth with a paper hanger brush. Do not use a hard roller on the seams; wipe over each seam with a soft cloth wrung out in cold clean water. This will render each seam invisible, except to the closest inspection.

H. B. WIGGIN'S SONS CO.

Manufacturers of Cloth Wall Coverings

233 Arch Street
BLOOMFIELD, N. J.

BRANCH OFFICE: 4860 South Halsted Street, CHICAGO, ILL.

Products

FAB-RIK-O-NA CLOTH WALL COVERINGS.

(The words Fab-Rik-O-Na and Ko-Na are registered trade-marks.)

For page on Ruffkote Plastic Stone for interior walls, see Manufacturers' Index.

Fab-Rik-O-Na Finished Wall Coverings

Offered in textured fabrics of plain or patterned designs, various colors and color combinations, they are well filled, evenly colored, thoroughly shrunk and prepared for pasting to the wall.

Rolls contain 50 yards and the fabrics are 30, 35 or 36 in. wide.

Fab-Rik-O-Na Prepared Wall Coverings (to Be Painted)

These fabrics are manufactured in a variety of widths, weights and textures with surfaces carefully prepared to receive paint after having been hung. They are fully shrunk, and well backed, ready for pasting to the wall in the same manner as wall paper.

The heavier fabrics are especially suitable for wainscoting in schools, salesrooms, office buildings and hotels.

Method of Application of Fab-Rik-O-Na Cloth Wall Coverings

All Fab-Rik-O-Na Cloth Wall Coverings are applied to the wall with fresh flour paste.

Details with directions are contained in each roll of goods.

Kling-Ko-Na Undercoating and Size

A white powder prepared for use by adding hot water. For use in preparing walls for papering, painting or enameling, and over painted or varnished walls before hanging wall coverings. Also over dyed burlap or raw woodwork before painting.

Can be used on walls of hard or sand finished plaster, stucco concrete and brick as well as on wall boards.

TRADE-MARK

Suggested Specification for Architects' Use

General—All decorative and prepared canvas, burlap or other fabrics used shall be of the kind below specified and quality of those shown in the Fab-Rik-O-Na line of cloth wall coverings of the H. B. WIGGIN'S SONS Co. of Bloomfield, N. J., and Chicago, Ill., and equal to samples of this material on file in the architects office.

Location—The above wall coverings shall be applied on ceilings and walls of the following

Application—After walls have been plastered, in accordance with specifications for plastering, and are thoroughly dry, they shall be given a coat of Kling-Ko-Na Size manufactured by same Company (or other good wall size approved by architect).

*A good grade of lining paper shall be applied over the entire wall and allowed to dry thoroughly.

The fabrics then shall be pasted to the wall with good stiff fresh flour paste, trimming to a sharp smooth edge butting together in actual contact, thoroughly rolled down. Follow all detailed printed instructions packed with the material.

Old walls shall be thoroughly cleaned and all cracks filled. All edges of cracks and patches shall be sand-papered to a smooth level surface. Walls shall be made smooth and clean and sized as above described.

Painting—Where Fab-Rik-O-Na prepared goods are used they shall be given coats of paint as herein specified.

Service to Architects

We are prepared to co-operate with architects by affording quotations, special samples and practical suggestions for the use of our decorative products.

Distribution

Stocks of Fab-Rik-O-Na Products are carried at Bloomfield, N. J. and Chicago, Ill. Shipments can be made direct from those points or deliveries may be obtained from our jobbing distributors in prominent centers throughout the United States.

*Lining the wall is optional with the architect and unnecessary when applying fabrics which are to be painted.

THE KLEARFLAX LINEN LOOMS, INC.

Manufacturers of Klearflax Linen Rugs and Carpets

DULUTH, MINN.

NEW YORK OFFICE: 295 Fifth Avenue

KLEARFLAX LINEN RUGS AND CARPETS

Where Used

Klearflax Linen Rugs and Carpets have been specified by many leading architects for a wide range of installations—in homes, clubs, churches, hotels, apartment houses, theatres, offices, hospitals, public and private buildings of nearly every kind.

Low Cost

Where unusual effects have been desired on very limited budgets, Klearflax has frequently been the solution. It is here especially that the sterling value of these rugs and carpets appears to best advantage.

Color and Texture

Klearflax is especially unique in both color and texture—two reasons perhaps more than any others, why it has appealed so strongly to architects for such a wide variety of places.

In linen, it is possible to obtain beautiful, soft, pastel shades as well as stronger colors that are not possible in other fabrics.

The texture of Klearflax possesses a rich, homespun or tweed effect that is very pleasing in its simplicity, dignity and restfulness.

Klearflax is thoroughly in accord with the vogue for rough stippled and troweled walls, wrought iron hardware and the best architectural trend of the day.

Other Features

Klearflax has many other features. It is reversible, mothproof, practically burnproof. It does not "furniture-mark." Plain or one-tone rugs and carpets are possible in Klearflax without the usual disadvantages associated with plain floor coverings.

Sizes

Klearflax is made in standard and special size rugs and runners and practically any length in rolls for carpet.

It is made in the following seamless widths—27 in., 3 ft., 4½ ft., 6 ft., 8 ft., 9 ft., 12 ft.

Literature and Specifications

For full information about Klearflax Rugs and Carpets, send for the A.I.A. folder giving in detail all the specifications for both the fabric and how it should be laid.

The House of Kent-Costikyan

The firm of Kent-Costikyan is one of the oldest exclusive Rug Importing Houses in New York today. Since 1886, we have been fitting the finest homes and institutions of America with hand-woven floor coverings. This experience of over forty years, largely in co-operation with the most artistic men and women in the architectural and decorative professions, qualifies us, as no other firm, to meet the most exacting requirements of service, and to find most expeditiously the rugs or carpets appropriate in design, color, price and quality to any particular decorative scheme submitted.

During this time we have fitted all conceivable types of rooms with high grade artistic floor coverings—sometimes with rugs furnished from stock, sometimes with rugs made to order, sometimes with plain carpets cut from rolls. These spaces include club and lodge rooms; directors' rooms and officers' platforms of banks; lobbies and lounges of hotels and apartment houses; reception rooms and executive offices; automobile and piano salesrooms; and fine private residences throughout in all types of decoration and color schemes. Suffice it to say that, given a reasonable time, we can solve any floor-covering problem in a manner that will give lasting satisfaction.

Rug Contracts

Rug contracts are usually let as a part of the decorating contract since they comprise an important part of the interior. Under such an arrangement the architect may be assured of Kent-Costikyan floor coverings being used by making this a

TRADE-MARK

condition under which the decorating contract is awarded. Architects and general contractors, however, are coming more to making the rug contract and other background elements such as paneling and lighting fixtures separate from the decorating contract with a view of furnishing the decorator or owner with a background on which to assemble the various interior furnishings. In such a case, we

are prepared to quote direct to the general contractor or owner and can guarantee the same satisfactory artistic result under the direction of the architect as we do when working in co-operation with an interior decorator.

Form for Specifying Kent-Costikyan Rugs or Carpets

"Rugs and Carpets of Kent-Costikyan Weave in the qualities specified are to be ordered sufficiently in advance so that delivery can be made before (Give approximate date of completion of building.)

Room	Quality	Main Color	Size of Rug or Carpet	Approx. sq. yd.	Floor Margin
.....
.....

"Colored designs are to be prepared in accordance with the architectural period style of the above rooms under the supervision of the architect and submitted to the architect and owner for final approval together with quality sample of the weaves specified and wool color tufts."

Specifications should be accompanied with full set of blueprints and elevations of rooms to be covered.

SCHEDULE OF SPECIAL ORDER QUALITIES

Type	Qualities	Pile and texture	Best adapted to designs of	Price range (list per sq. yd.)	Delivery (N. Y.)	Maximum seamless width, ft. (no limit to length)	Where made
Spanish Handtuft	Sierra, Seville, Oporto, Corsica	Medium and high pile, rough dull texture, chiseled design	Plain, Two-tone All over, Spanish, French Floral Spanish	\$36 to \$63	4 to 6 months	48	Spain

American Hooked	Gloucester, St. John	Low pile, pebbly antique texture	Early American	\$30 to \$81	3 to 6 months	21x15	Canada

Designs

During our many years in business some of the finest rugs of all times have gone through our establishment, and in our design volumes will be found beautiful color sketches of the choicest of these rugs. These sketches, of which we have accumulated several thousand during our forty years in business, are the foundation from which the rug to be made to order is started. Our clients select one that they feel most appropriate, and then our designer changes or modifies this in color or design to fit the exact taste of decorator and owner. The line of qualities carried and the range of possibilities in this department are so great that they can only be appreciated by a visit to our floor, where all designs and quality samples can be inspected. For those who find this impossible, however, these pages, supplemented by quality sam-

ples as orders come up, will be found adequate in most cases.

Samples

Samples suitable to show to prospective customers, complete in colors and qualities carried, will be sent upon request. Our samples are made in a standard size, 3x2 ft., and after serving their use as samples can fit very well in doorways, alcoves, etc. Samples are expensive to make up, and we are obliged to make a charge for them, if not returned within 30 days. However, we are willing to refund payments on all samples at any time, provided not damaged. We recommend that only samples be ordered in the types of merchandise for which it is felt there is a call in your own territory. Prices for 3x2 samples equal one-third of the list square yard price on each quality.

Specially Designed and Emblem Rugs

For Clubs, Fraternities, Lodges, Banks and Hotels (Not Sold for Private Homes)

Types—Alsatian E—High pile, pebbly texture.

Alsatian EE—High pile, smooth texture.

Plain Carpet Department

In addition to Chenille, to meet the large demand for plain floor coverings and still retain the quality in texture and durability of Orientals, we have perfected our Kentshah Plain Seamless Hand-woven Carpet. This we carry in stock for 2 to 5-week delivery in widths of 9, 12, 15, 18 and 21 ft., in four standard neutral shades. This goods, unlike machine-made carpet, can be dyed in the piece to any other color desired, and its texture blends perfectly with Orientals adjoining. It has a delicate sheen that enhances with wear and shows footprints less than any other plain fabric. It can be cut in exact sizes desired, in either dull (unwashed) finish or silky (washed) finish, with or without fringe. Special colors can be matched.

Price Range on Plain Seamless Carpets—\$11.00 to \$48.00 per sq. yd.

Seamless Chenille Rugs Made to Order in Scotland

Delivery—10 to 14 weeks.

Range of Colors—Unlimited.

Maximum Width—33 ft.

Price Range—\$21.00 to \$66.00 per sq. yd.

Qualities (from Cheapest to Most Expensive)—Ayre, medium pile; Shetland, medium pile; Sutherland, low pile; Essex, high pile; Tudor, medium pile; Orkney, medium pile; Argyle, medium pile; Kentico, medium pile; Wight, high pile.

Patterns Available—

Plain—Entirely plain rugs in any color.

Band Borders—Entirely plain centers, with any arrangement of plain lines or band borders in any color combination.

Two-tone Effects—Simple two-tone designs with lines, band or simple figured border. Repeat of design limited to 4½ in. For special designs there is an extra charge of \$50.00.

Type K—More elaborate designs, with designs of repeats up to 9 in. Any color variety can be used. For special designs there is an extra charge of \$125.00.

Designs of more elaborate nature than Type K can also be made, but they should be submitted to us for special estimate.

Borders and All-over Effects for Seamless Plain Carpets

Block print borders or all-over effects have the great advantage over woven-in borders of quick delivery; the artistic effect is equal, if not superior, and we guarantee absolute satisfaction as to wearing qualities and fastness of color.

Delivery—Block print borders or all-over designs, 3 weeks; woven-in borders or all-over designs, 3 to 6 months.

Range of Colors and Qualities—Kentico Seamless Chenille in beige, sand glow, faun, mellow gold, walnut, taupe lake, taupe, rose taupe, briar, henna, raisin, jade green, Nile green, green, peach, rose, blue, orchid; Kentshah Seamless Plain Hand-woven Carpet in beige, camel, taupe or beaver.

Special colors made to match sample, in Kentshah quality \$8.00 extra per sq. yd. 5 weeks delivery.

Widths in Stock—Kentico Chenille, 9, 12, 15, 18 and 24 ft.; Kentshah carpet, 9, 12, 15, 18 and 21 ft. (Wider than above must be made to order.)

Price Range—For borders \$5.00 to \$10.00 per lin. yd. in addition to price of carpet. For all-over pattern \$5.00 to \$10.00 per sq. yd. in addition to price of carpet.

Flat extra charge for special designs; one or two colors \$50.00; three or four colors \$100.00.

Advantages of Hand-woven Floor Coverings

Our Oriental rugs and hand-woven plain carpets, while more expensive than machine-made domestic floor coverings, have certain advantages.

(1) They give a home atmosphere of hospitality that is impossible to get with other floor coverings.

(2) They excel in durability and investment value. It is a fact, proven by many rugs sent to us by estates of former clients, that a good Oriental will last a lifetime in the home and for ten years at least under condition of heavy hotel wear. It is also well known that in the liquidation of estates the Oriental rugs bring a larger per cent of their original cost than any other property.

(3) They can be readily repaired without detection, native weavers in America simply restoring damaged spots by hand in the original weave.

(4) Their texture is the most attractive and shows no footprints, an objection often raised to chenille and other machine-made carpet.

(5) They can be made seamless to fit exactly any decorative scheme and in perfect sizes.

Rugs Made to Order for Period Rooms

(See third preceding page.)

The majority of home builders, architects and decorators do not realize the wonderful decorative results now possible in having practically any type of hand-made rugs, including Orientals, made to order. All with decorative experience will admit that the floor covering is a most important part of the foundation scheme of a room (which should be given consideration at the same time that the walls and ceilings are planned), yet the tendency is to let the selection of rugs, which are fully as much a background as the walls, remain until the very last even after furniture and draperies have been selected. The final artistic result under such a plan of decorating is very likely to be disappointing. The ideal rugs for the room will more than likely be the wrong size or the wrong color or inappropriate in design or too high in price and the unhappy decorator will spend many vexatious months hunting the market for something suitable. All these difficulties can be overcome by meeting this problem when it should be met—viz: immediately on completion of the blue prints. There will then be time to carefully plan the rugs for the important rooms in the same manner that the fixtures and other parts of the background have been planned.

It is now possible through our organization to weave abroad and deliver in from 3 to 9 months practically every kind of rug available in the stores with many additional types not found in the usual commercial channels. Even antiques can be reproduced in a manner that will give the same charming color and texture effects so much sought after in these old pieces at a much more reasonable price than the originals from which they are made. Among the weaves we have successfully made to order are the French Aubusson and Savonnerie rugs, the Persian Fereghan, Sarouk, Kashan and Kerman rugs, Chinese Rugs, Spanish and Austrian Handtufted rugs and American hooked rugs. These are woven by hand exactly in the same manner and under the same conditions as all Orientals for ages past. It is because of modern improvements in transportation and our careful supervision work that made-to-order rugs are now available in a reasonable time and with assurance of perfect execution. We can furnish many unsolicited letters of appreciation from clients who were at first inclined to be skeptical of the possibilities of this new method of meeting their rug problems.

The success of such work lies largely in the hands of the architect, since he alone can visualize the various rooms as they will appear on completion and he is therefore in the best position to make the proper selection from the various designs and samples submitted. Moreover, the architect is probably the only adviser the owner has to see at the time of completing the blue prints—and if the best results are to be attained the rugs must be planned then. The architect will be well repaid for his efforts in controlling the selection of floor coverings, as the spirit of the home, so often spoiled after the architect has completed the construction, will be carried out to include the interior furnishings. The rugs will be perfect in size, harmonious in design and color, and of a style and texture suited to the home and room which is being planned.

In order to make our suggestions we must be supplied with a set of blue prints including elevations, with the approximate appropriation for rugs and with the predominating colors desired. We then submit colored designs, quality samples and very often small rugs which can be modified to suit the owner's, architect's and decorator's taste exactly. The final approved sketch made up by our designers is sent to our looms in Persia, India, China or Europe, and within the time specified the completed rug will arrive in New York. In case the time available is not sufficient we loan suitable temporary rugs without extra charge pending final delivery. Rugs made to order in this manner having no carrying charge are reasonable in price, and the owner is assured of something unique without duplication.

Should a client have a room already furnished for which a rug is needed his problem of selecting a suitable piece from stock except in the standard sizes is even more difficult. Unless he is fortunate the rug will clash in color or pattern with some of the other furnishings. Here again, the best solution is offered in our special order service—making a rug to fit its surroundings in color and in spirit. The owner will be well repaid for the short wait by having a pleasing and restful ensemble.

Products

WESTFELT CARPET and RUG
CUSHIONS.
TREADSOFT CARPET CUSHIONS.

What Is Westfelt?

Westfelt is a strong, protecting cushion or padding for use under any soft-surface floor covering. When laid under rugs and carpets, it gives a sense of luxurious ease. You have a thick, soft, springy cushion between your feet and the floor. Besides this "feel" of depth and softness which it imparts to any rug or carpet—from the least expensive to the most costly—it gives longer, more comfortable service to the rug thus protected and reinforced.

Westfelt is actually an extra rug or carpet-length manufactured from combed jute fibre, obtained from a plant of the same name grown principally in the Province of Bengal, India. By a special process, the finely combed jute fibres are vertically interlaced through a heavy burlap base which is also made of jute.

Advantages of Westfelt

Economy—Gives long, satisfactory service at a reasonable price. The use of Westfelt and Treadsoft doubles the life of new rugs or carpets; adds years to the life of used ones.

Durability—Westfelt will give years of wear. It lies absolutely smooth and flat; will not curl, twist, or stretch out of shape. It retains remarkable cushion qualities even under carpets subject to terrific traffic.

Sanitation—Westfelt is purely vegetable and sanitary. Being absolutely free from hair or animal matter, there is no possibility of germs, odor or vermin.

Ease of Cleaning—It has a smooth surface, so dust does not work into it. It can be thoroughly and easily cleaned by the professional dry cleaner or with a carpet sweeper or vacuum cleaner.

Comfort—It retards slipping or sliding on polished surfaces; it makes walking safer and easier.

WESTFELT RUG AND CARPET CUSHION

½-in. Westfelt Rug Cushion

Ease of Installation—No anchor is necessary to hold Westfelt to the floor, because it clings as if it were a part of the covering itself. Merely put under rugs at any time by rolling them back. Install under carpets when laid, or before relaying after cleaning. Use cement on sloping aisles in theaters only.

Quietness—Westfelt absorbs the shock of shoe heels and reduces friction between the rug and the floor.

Many builders are using Westfelt underneath carpets in apartments to reduce the overhead noise between floors. The same use applies in private homes, Pullman and private railway cars.

Moth Resistance—Made entirely of vegetable product, Westfelt is free from the animal taint or hair which attracts moths.

Sizes—Westfelt rug preserver cushions are manufactured to fit all size rugs. Popular standard sizes are carried in stock with the edges neatly bound and taped. Odd sizes made special.

All rug cushions are made slightly smaller than the rug size, so that no portion of the pad shows. Each rug is packed in individual dustproof wrapping.

STANDARD DIMENSIONS OF WESTFELT AND TREADSOFT YARD GOODS IN ROLLS*

Thickness	Width	Length	Average weight per sq. yd.
*¼ in.	27 in., 1, 2 and 3 yds.	75 ft.	2.25 lb.
†⅜ in.	27 in., 1, 2 and 3 yds.	75 ft.	2.90 lb.
†½ in.	27 in., 1, 2 and 3 yds.	50 ft.	4.00 lb.
†¾ in.	27 in., 1, 2 and 3 yds.	50 ft.	5.00 lb.

*Made in Treadsoft quality only.

†Made in both Treadsoft and Westfelt quality.
Give exact width required when ordering.

Treadsoft

Made from a raw jute material not quite so light in color. Has wonderful cushion quality and widely used for contract work. Has been also widely used by hotels without any complaint.

Westfelt Guarantee

Westfelt carpet and rug cushions are guaranteed by the manufacturer to give satisfaction. Each is trade-marked for your protection.

The Mohawk Carpet Mills Offers Architects a Modern and Complete Woven Floor Covering Service

The selection of suitable rugs and carpets involves many technical problems which may at the start deter the architect from entering this field of activity. There is no reason, however, why any architect, who will take advantage of the service that the manufacturer stands ready to offer, should hesitate to venture into this field. To be specific: he may count upon the following services of co-operation from the MOHAWK CARPET MILLS:

Expert Consultation Service Without Charge

(1) We will, without obligation, send an expert to go over with him the plans for the building to be equipped, to determine the types of fabrics that will suit each particular use.

Samples

(2) We will submit for his examination samples

of the different types of fabric suitable for each use, with approximate cost per square yard.

Stock or Special Pattern

(3) We will offer him a wide range of stock patterns suitable for use in the type of building he is erecting. If none of the stock patterns meets the particular needs, our designing department will prepare for him special designs to blend in motif and coloring with the other features of the building.

Prices

(4) We will give him prices, based upon as low production costs as are to be found in any mills in America.

Delivery

(5) We will deliver goods on the date promised, subject, of course, to conditions beyond our control.

Mohawk Mills Produce Every Modern Weave

Mohawk, the *only* mills in America producing every modern weave, offers to architects for contract specification carpets in the weaves mentioned on this and the preceding page. Each weave, in turn, is offered in a

number of grades. This makes it possible to carpet every part of any building economically and with exactly the right fabric—and all from one mill, assuring uniform quality.

Chenilles

Deep-piled, lustrous, softly beautiful, Mohawk Chenilles possess a distinctive and luxurious character. Chenille is the one domestic floor covering of unlimited possibilities, in design, color, shape and depth of pile. It can be woven to order to fit, without cutting, any specified outline, however irregular.

For example, the giant Mohawk Chenille rug in the Fox Theatre in San Francisco has a large semi-circular inset, woven in, to run around the grand staircase. Specially designed symbols, made a part of the pattern, reflect the personality of the theatre and bespeak its individuality.

Made of lustrous yarns

of selected quality, Mohawk Chenilles are recommended for lobbies and public rooms where long wear, coupled with sumptuous "feel" and appearance, are

desired. Many of America's finest hotels, apartment houses, theatres and private residences are equipped with Mohawk Chenille. Chenille is also available ready woven in many plain tones, both in rugs and carpets.

Executive Officers' Foyer in the Bank of Manhattan Trust Company—Mohawk Carpeted

Mohawk "Capital" Broadloom Carpet

Mohawk "Capital" Broadloom Carpet is contributing its charm and service to countless interiors of distinction. Broadloom is made in eight widths, from 27 in. to 18 ft., and in 24 varied shades and colors. With this wide range of fabrics it is possible to cover any floor in a beautiful single tone carpeting—seamless from wall to wall. It is a durable, deep-piled fabric made of yarns that provide a carpet of great resiliency.

The Broadloom range of colors, shown at left, is wide enough to insure a tonal blend with any decorative scheme, or the carpet itself will form the background for tasteful color harmony. Homes, clubs, hotels, offices and theatres take many *miles* of Mohawk "Broadloom" every year. Broadloom colors are: Taupe, Natural, Fawn, Peach, Burma Rose, Briar, Castillian Red, Taupe Lake, Heather Mist, Rose Taupe, Jade Green, Blue, Raisin, Orchid, Black, Forest Green, Mulberry, Burgundy, Ashes of Roses, Turquoise Blue, Sage Green, Crimson, Gold, French Blue.

Worsted Wilton Carpet

Worsted Wilton Carpet is especially suited to the higher type of hotels, clubs and residences. Next to Chenille, Wilton is the most luxurious weave. It is the one generally known as having "buried" or hidden quality, since a portion of the yarn used in the fabric is buried in the back, adding resiliency and quality to the carpet. On this page are shown two of the many worsted Wilton patterns.

Kenmore Pattern 2144-C

Kinross Pattern 3018-T

Mohawk Carpet Fabrics Are Styled Each Year

All of our carpet fabrics are thoroughly styled each year to insure an active choice in keeping with decorative trends in general.

Mohawk Saxony Pattern 19-E

Saxony Weave (Wool Wilton) Carpets

These carpets are woven of heavy spun woolen yarn and are built in various frames. They are suitable for hotels and institutional lobbies, corridors and other public concourses. The wool is blended with great care to give the carpet the durability it must have. Mohawk offers several grades or variants of the Saxony construction.

Mohawk Saxony Pattern 90-H

Gordon Pattern 396-K

Wool Wilton Carpets

Wool Wilton Carpet is a high pile fabric suitable for theater auditoriums, public spaces in institutions, and for residences where a high type of carpet is desired. Wool Wilton is a durable carpet built for hard usage and offers excellent facilities for special design and color combinations.

Gordon Pattern 316-E

Aristo Pattern 1023

Axminster Carpets

The Axminster is a firmly woven carpet which has been an extensive seller on the American market and its quality is very well known. The pile is high and is composed of lustrous yarns. The new line of patterns includes splendid up-to-date effects for contract work. The Axminster is also a heavy duty carpet.

Tampa Pattern 6605

Columbian Pattern 5341

Velvet Carpets

Velvet Carpet is a good-looking, substantial fabric especially recommended where service considerations and price are paramount. It is made both in body and stair carpets, plain and designed.

Columbian Pattern 2340

Mohawk "Orientals"

A wide choice of American "Orientals" is offered in Mohawk's two exceptional series—the Caliph and its lower-priced running-mate, the Viceroy.

Architects whose plans require the charm of

pattern and lustre, the silky "feel," peculiar to the Oriental, will find in the Caliph and Viceroy, fabrics to meet every decorative need and every budget allowance.

The Caliph

This rug is woven of worsted yarn and has a deep, rich pile and an incomparable lustre. Included in the range of Caliph patterns are 30 faithful reproductions of venerable museum pieces, all of them priceless. The Caliph is, in fact, the *only* sheen-type rug in the \$150 price range, which is *all worsted*. Like the Viceroy, it is available in all the standard sizes.

The Viceroy

Oriental lustre at a remarkably low price could be produced only through the resources of a great mill like Mohawk. The Viceroy is offered in a choice of 20 color combinations and patterns, each inspired by a museum masterpiece. It's a seamless rug, woven of heavy wool, and has a deep, rich pile—truly an astounding achievement in the art of rug weaving. The Viceroy is in the \$100 retail price range.

Caliph Pattern 136/99

Guarantee

We guarantee every yard of Mohawk goods against defects either in materials or workmanship.

We want to emphasize that all this service is rendered in co-operation with local dealers or with contract supply houses. You can get their service in addition to all the above at no added cost. We will also give the names of reliable local dealers who can handle the entire contract and give estimates for the work.

Handbook

We have issued a handbook of rugs and carpets containing valuable information for architects and decorators. It is a 27-page booklet in full color, durably bound. It will serve you as a modern reference work on the various types and grades of carpets and rugs manufactured to-day.

Write for your free copy. Address the Contract Department.

A Deep and Enduring Lustre

The Caliph's lustre will endure for the life of the rug. The proof? Take a pencil, or your index finger, and lay back the pile. Notice its depth and also the fact that the softly beautiful lustre penetrates clear through to the warp. This distinctive feature of the Mohawk Caliph is the result of a careful selection of wools—plus a perfected treatment.

FLOOR ACCESSORIES CO., INC.

Tackless Carpet Strips

GENERAL OFFICE
KANSAS CITY, MO.

AGENTS IN PRINCIPAL CITIES

Products

TACKLESS CARPET STRIPS.

For Ankortite Floor Joiners, Floor Clips, Buck Anchors, Shelf Angle Fixtures and Hanger Fixtures, Recessed Floor Bar and Standard Brass Thresholds, see Manufacturers' Index.

Tackless Carpet Strip

By eliminating tacks, the Tackless Carpet Strip produces a smooth carpet installation—free from exposed tack heads or depressions. The smoothness and beauty of carpeted floors, together with the simplicity and economy of the strip, makes it a most practical and satisfactory method of carpet fastening.

Design No. 1

Fits Under and Locks Behind the Baseboard

This design is installed when the baseboard is being attached

The Tackless Carpet Strip is made of 24-gauge non-corrosive metal with three rows of upturned teeth for holding the carpet. It contains 36 teeth per lineal foot, which take a firm grip in the base of the carpet and hold more securely than a single row of tacks in wood or composition strips, or plugs. The strip is used in both new buildings and in carpeting rooms or offices where the baseboard is already in place.

As the baseboard is put on the Tackless Carpet Strip is laid under it with the baseboard resting in the channel of the strip. The baseboard, when attached, locks and holds the strip in place, but the strip may also be nailed to the floor at intervals if additional security is desired. Special case-hardened nails for driving into concrete floors are furnished for this purpose. The installation of the strip, therefore, is quick and economical.

When the strip is in place the carpets are laid by the same methods as where tacking is used, except that the carpet is pressed over the teeth on the strip by running a hammer or other tool over it instead of driving tacks into a nailing strip. After the carpet is laid, the base shoe is attached to the baseboard as usual.

The Tackless Carpet Strip is placed along the baseboard only. At doorways or other openings and around hearths where there is no baseboard, the carpets are fastened in the manner ordinarily used at such places.

Advantages

Produces a smooth, workmanlike and beautiful carpet installation, free from tack heads or depressions.

Is simple, quick and economical to attach.

Eliminates tacking. Facilitates laying. Lasts the life of the building.

Holds stronger than tacking; is more durable and dependable.

Permits easy removal of carpet for cleaning or replacement without injury to carpet or strip. Shows same economy in relaying as in original installation.

With concrete floors it eliminates the cost of material and labor to provide a tacking strip since it is necessary only to float the structural concrete to a level surface.

Eliminates the burying of wood grounds in concrete floor slab prior to determining the exact location of partitions as well as the uncertainty of finding the grounds.

Installation of the strip requires but one operation, the cost of which is easily determined, and is far more economical than methods that require several scattered operations that are hard to compute individually but nevertheless have an excessive combined cost.

Design No. 2

Used Where Baseboard Is Already in Place

This style is slid under the baseboard slightly and nailed through holes provided in the opposite flange. Special nails for driving into concrete are furnished with this design also

Prices

Design No. 1.....5¢ lin. ft.

Design No. 2.....5¢ lin. ft.

Concrete nails included and freight allowed. Furnished in standard lengths of 8 ft. and is easily cut on the job to fit any space.

When ordering, please state design desired and thickness of lining to be used under carpet. On orders for No. 1 Design, thickness of baseboard should also be given.

Architect's Specification

(Recommended under carpentry work.)

This contractor shall provide and install at all walls, partitions and other vertical surfaces in rooms shown or specified to be carpeted, the Tackless Carpet Strip manufactured by the FLOOR ACCESSORIES Co., Inc., Kansas City, Mo. This Carpet Strip shall be their Design No. (state here whether No. 1 or No. 2) of the proper height to accommodate the thickness of carpet lining to be used and placed in accordance with manufacturer's directions.

ECCLESIASTICAL WORK, such as: Altars, Altar Railings and Pulpits of Marble, Scagliola and Rigalico; Statues, Stations of the Cross; Cemetery Groups, Stained Glass Windows, Sounding Boards; Baptismal Fonts; Sanctuary Lamps; Electroliers; Monuments, Oil Paintings, Mosaics, Special Modeling and Sculpturing, Voice Amplifier Systems, etc. Correspondence invited.

Services and Facilities

The DAPRATO STATUARY COMPANY are designers, sculptors, and makers of ecclesiastical products.

Their studios, which have been established for 70 years, are today among the largest of their kind in

the world, and maintain a staff of artists, modelers and sculptors of exceptional skill and ability.

The Daprato Library of Ecclesiastical Art, which they believe is the most extensive of its kind, enables them to certify to the liturgical, historical and architectural correctness of their productions.

Original designs of architects for the creation of new forms in architectural embellishment in the form of special statuary, relief work or ornamental effects will be faithfully and correctly executed.

The DAPRATO STATUARY COMPANY will gladly assist in the execution of monumental projects as well as in the execution of smaller projects where the financial resources are necessarily limited.

Designed by Joseph Venne, Architect

Rigalico Altar—Sacre Coeur de Jesus Church, Montreal, P. Q.

Altar and ornamental arch (the latter rising above section shown) are made of Rigalico. Some conception of the size of above altar will be gained from the fact that there are more than 250 statues in the reredos niches. Note that upper panels contain mosaics, central panel reliefs, while the lower panels are embellished with gold glass mosaic. With the exception of the angelic choir shown in upper relief, the above altar was executed in its entirety in the studios of DAPRATO STATUARY COMPANY, Chicago, New York and Montreal.

THE GORHAM COMPANY

Ecclesiastical Productions

576 Fifth Avenue at 47th Street
NEW YORK, N. Y.

G. E. WALTER, INC.

Designers and Manufacturers of Duretta Composition, Artificial Stone, Ornamental Plaster, Duro-Compo Ornaments for Woodwork, Lighting Fixtures, Wrought Iron, Metal Work and Interior Finishes

425 East 53rd Street
NEW YORK, N. Y.

Products

Ornamental Plastering—All period styles including the modernistic, antique plaster finishes and parge plastering.

Interior Cast Stone—All types of plain and ornamental imitation stone for interiors, both applied and precast. Caen Stone, Limestone, Travertine, etc.

Cast Stone Mantels—Catalogue on request of period reproductions.

Duro-Compo Ornaments for Woodwork—Pressed composition exactly imitating carved wood and applied to woodwork. Soft and flexible when applied but becomes hard as rock, and if properly applied, will adhere permanently. Six or seven thousand stock designs comprising column and pilaster caps, mouldings, rosettes, festoons, friezes, corbels, stair brackets, panels, Grinling Gibbons ornaments, and a wide variety of other ornamental details.

Models—Will execute plaster or carved wood models for stone or metal.

Lighting Fixtures—Design and manufacture all types of lighting fixtures in wrought iron, bronze, crystal and compo. Specializing in reproduction of the antique and special design work. Wide range of designs in English, Italian, Spanish, French and Colonial styles, comprising wall brackets, ceiling fixtures, lanterns, floor and table standards. Will submit special designs for entire schemes for any type of building.

Wrought Iron, Bronze and Other Metals—Equipped to make a considerable variety of special objects and architectural details in metal requiring a high type of workmanship. Fine finishes and originality of construction, including cast metals, such as bronze, brass, aluminum, galvano work, sheet metal and wrought metal.

Duretta, Ornamental Plaster, Cast Stone and Wrought Iron by G. E. Walter, Inc.

Door Panel D-106

Duretta Fireproof Composition

What It Is—Duretta is a fibrous fireproof composition, cast in gelatin moulds and reinforced with metal where necessary. It exactly reproduces plain and carved woodwork or metal, is comparable to wood in durability and will neither warp nor shrink. It can be easily stained, painted or gilded. Duretta work is easily erected and can be secured in place with nails or screws.

The Bureau of Buildings of New York City has approved Duretta for use in fireproof buildings.

General Types and Uses—Duretta can be used as a substitute for wood in the decoration of fireproof buildings and is suitable for plain and carved paneling, ceilings, mantels, grilles, frames, consoles, lighting fixtures, etc. There are three distinct types of Duretta which are specified according to their uses:

Duretta Wood Composition.

Duretta Iron Composition.

Duretta Exterior Composition.

Modernistic Style—Duretta in special finishes such as polished silver, gold and copper is an excellent medium for the expression of modern ideas in decoration.

Planning Special Work—We are prepared to co-operate with the architect in the planning of any special work involving the use of Duretta. Where given definite information as to the general type of work, sizes and quantities, we will prepare sketches utilizing our stock designs where possible. This service is rendered without obligation.

Cost—In the matter of cost Duretta work will generally be found considerably more economical than wood. This is especially true where the design includes carved features. Where plain paneling is used the saving over

wood will depend upon the proportion of repetition, the extent to which a limited number of moulds can be used for a quantity of casts.

Columns—Exterior or interior columns and pilasters of any type are practical in Duretta, or caps, alone, can be supplied for columns or pilasters in other materials.

Half-timber—Duretta half-timber work is recommended primarily for fire-proof construction, and for use in general, where the design is largely ornamental.

Mantels—Duretta mantels in imitation wood are especially adapted for requirements calling for a quantity of mantels of the same design and size. Also, mantels in imitation stone.

Duretta Wainscots—Duretta wainscots are cast in sections of one to four panels in width. They can be screwed to wood grounds or applied to any wall presenting an even surface.

Ceilings—Duretta is used for coffered and beam ceilings in carved wood effect, also cornices and corbels.

Duretta Door Panels—Duretta door panels are cast in one piece and can be inserted in either wood or fireproof metal doors. They can be secured with narrow mouldings or by screws.

Ornamental panels of various types can also be successfully used in connection with woodwork for many other purposes.

Rails—Duretta has been extensively used for carved balusters.

Duretta Grilles—Duretta grilles are furnished unfinished or in bronze, gilt, verde antique, rusty iron, polished iron, marble and various other finishes. Duretta grilles range in thickness from 1/2 in. up, according to the design.

Special Designs and Estimates

In addition to our large line of stock ornaments in Compo and Duretta composition, we are equipped to make up models of special designs, and will quote prices promptly on this character of work upon receipt of scale

or detail drawings. Where given definite information as to the general type of work, sizes and quantities, we will prepare sketches utilizing our stock designs where possible.

ART METAL IN THE MODERN BANK

For more than forty years ART METAL CONSTRUCTION COMPANY has assisted architects, bankers and public officials in the arrangement and decorations of banks and buildings of the commonwealth. Practically every city in America does its banking in one or more institutions in which the steel equipment and bronze grilles, doorways and furniture were produced by the ART METAL CONSTRUCTION COMPANY. One bank in every four has Art Metal furnishings. This vast experience in building metal equipment for bank interiors has given Art Metal engineers and designers a tremendous store of specialized knowledge of the requirements of bank work. This experience is freely available to every architect confronted with the problem of designing a bank interior.

Art Metal equipment for banks includes the following: Bronze entrance and vestibule doors; elevator enclosures; check desks, counter screens; wicket and vault grilles; cage partitions; bank counters, filing equipment; bookkeeping desks; savings ledger desks; desks for officers' use; coupon booths, etc.

The Counter Screen Gives Character to the Interior

During its long experience ART METAL CONSTRUCTION COMPANY has produced every style of bank equipment for every size and kind of bank from the large metropolitan banking institutions to the modest rooms of banks in small communities all over the country. Probably the most prominent feature of any banking room and one which gives it character is the counter screen.

While the style of this equipment is largely one of individual taste the modern trend is away from the high, massive screen towards the low one which gives a more open, airy effect, enhancing the architectural design and decorative details of the banking room. In some instances the screen above the counter is entirely eliminated. Art Metal counter screens are composite fixtures built with metal or marble front, harmonizing in material and finish with the general architectural scheme.

When desired, ART METAL CONSTRUCTION COMPANY will handle the entire work including the marble base although they prefer to do only the metal work, placing it on marble or other base after it has been finished by others.

A Type of Counter for Every Need

ART METAL CONSTRUCTION COMPANY makes two general types of counters. One is the usual flat counter and the other is provided with a metal roll top which can be readily closed, protecting everything on the counter when the teller is temporarily absent. The space below the counter may be left open or drawers or a cupboard for the teller's use may be placed there. Both types of counter with different bases are shown in detail on page 8 and illustrated on page 9.

Tellers' Cages

Modern practice is also towards the elimination of cages which carry out the open effect of the low screens and at the same time afford more room. Sometimes the tellers' desks are separated by counters which provide additional working space. Where cages are desired there are many types. They may be of metal panels as high as the counter with glass or rails above. A metal lattice or a perforated metal grille may be used in the lower portion to afford ventilation. A few types are illustrated on page 9 but variations are almost endless.

Produced by Skilled Artisans Using Modern Equipment

ART METAL CONSTRUCTION COMPANY has unsurpassed facilities for the production of wrought or ornamental cast bronze work of highest quality. The uniform quality of Art Metal bronze is insured by the most modern equipment of thermometers and gauges and by constant laboratory tests.

To produce work of the highest character requires skilled artisans. The volume of work always in progress enables ART METAL CONSTRUCTION COMPANY to give permanent employment to a large force of highly trained men—each a true artist. A great deal of reverence and love for fine cabinet work in steel and bronze goes into the production of each order. It is an Art Metal tradition to

cast, polish and hand chase bronze work as carefully as though each piece were to repose on a library table or to occupy an honored place in a museum.

Co-operation with Architects Insures Individuality

Working from blue prints of the floor plans, Art Metal engineers will be glad to submit modern layouts of counter equipment and cages for the most efficient conduct of the work of the bank. This, of course, is done after consultation with the architect and banking officials and a determination of the requirements of the particular institution.

Architectural individuality is obtained by Art Metal designers working with the architect and carefully modelling the details from his designs. All work is individually prepared and carefully executed for each important contract. The work is finished with cutting tools, chisels, files and gravers. Often the natural skin of the metal solidified in contact with the mould is preserved. Then again it is carved and chased, beaten, wrought and embossed.

It has been our good fortune to visualize in bronze and steel the designs of the most eminent architects. The interior of an Art Metal bank is remembered for its genuineness, dignity and all-pervading refinements.

Stock Designs Are Available When Cost Is a Factor

Where cost is consideration ART METAL CONSTRUCTION COMPANY has a wide range of stock designs which may be combined to produce a most attractive interior effect at a minimum expense.

PETERSON & CLARKE, Architects

ART METAL BANK EQUIPMENT

Not only does ART METAL CONSTRUCTION COMPANY produce the beautiful, ornamental bronze work which adorns the public spaces of modern banks. It also builds steel equipment which includes every item used in a bank, office or public building, from desk tray and waste basket to officers' desks and fire resisting record safes. In filing devices, all forms and sizes to take every standard size record in use are manufactured.

Any requirement in desks, vault trucks, steel

safes and filing devices which cannot be filled from stock can be met in our facilities for built-to-order work.

On this page are illustrated some of the special equipment designed and built by Art Metal to facilitate the rapid and efficient handling of the large volume of work in some of the largest banks in the country. Art Metal engineers will gladly consult with architects and bank officials regarding special equipment which will assist them in handling their problems most efficiently.

SPECIFICATIONS FOR BANK COUNTERS AND EQUIPMENT

Counter Work

Pedestals—See pedestal specifications.

Knee Space Panels—To be made of No. 18 gauge steel with $\frac{1}{2}$ in. adjustment and No. 18 gauge adjustment strip at bottom. Bronze cove mould will be furnished in place of adjustment strip at bottom at extra cost if so desired.

Legs—To be of No. 18 gauge steel formed up square and tapered, with corners welded, or of 2-in. sq. tubing of No. 16 gauge if so desired. Bottom of leg to be fitted with bronze foot of suitable design and equipped with adjustable bolt at bottom.

Front Aprons—To be made of No. 13 gauge steel formed at right angle at top and zee section at bottom for strength and to form strike for drawer. Front to be reinforced by heavy steel bar which extends from end to end of counter and is securely bolted to lower flanges of uprights.

Rear Aprons—To be made of No. 13 gauge steel formed at right angle at top, with knee space panel screwed to bottom.

Drawer Uprights—To be of No. 18 gauge steel flanged all around and, securely welded to top, front and rear aprons.

Pistol Openings—To be made with bottom and back in one piece of No. 20 gauge steel.

Top—To be of No. 14 gauge steel, reinforced as necessary, all exposed edges formed into a channel section and all corners rounded to a $\frac{3}{8}$ -in. radius. Top to be covered with the best grade linoleum .119 in. thick, color green, securely cemented to steel with edges bound by bronze binding secured to top with concealed screws. When deal plates are required, same will be recessed flush with top.

Cupboard and Pedestal (Hinge Doors)—Single Wall Construction

Ends and Backs—Forming shell or jacket with an area of 1,500 sq. in. or less for any one surface when formed up shall be made of No. 18 gauge steel; for larger surfaces No. 16 gauge steel shall be used. Front edges of uprights to be formed into a channel section with a 1 in. flat face. Top and bottom edges to be flanged or stiffened by angles electro-welded to same. Strikes for doors to be formed $\frac{1}{8}$ in. high on return flange of uprights, and perforations for shelf adjustment 1 in. centers to be made in returned flange. Large ends to be reinforced as necessary.

All pedestals under counters to be built with $\frac{1}{2}$ in. adjustment at bottom and with an 18-gauge steel adjustment strip running all around at floor.

Bronze cove mould will be furnished in place of adjustment strip at bottom at extra cost if so desired.

Bottom Plate—To be made of No. 18 or No. 16 gauge steel, depending on size, to be formed with offset at front for door strike. Bottom plate to form base at front.

Plain Shelves—To be made of No. 18 gauge steel front formed into a box channel section with a $\frac{3}{4}$ -in. flat face, end and back to be flanged down. Bracket adjustment to be used at

front. Rear of shelf to be hung on adjustment strips with lugs formed at intervals of 1 in.

Doors—Up to and including 21x36 in. to be made of No. 11 gauge steel. Doors over 36 in. high and up to and including 48 in. high to be made of No. 8 gauge steel. Over 48 in. high, doors to be made of No. 20 gauge steel formed up with stiles and rails $\frac{3}{4}$ in. thick to be flush outside. Doors over 20x60 in. to be reinforced with channel section. Doors to be hung on heavy wrought hinges.

Door Knobs—To be of solid cast bronze and arranged to operate a steel latch to which up and down bolts are attached when doors are in pairs or are over 18 in. high, thus holding doors securely at top and bottom when locked. When locks are specified Yale locks shall be used and lock bolt is to engage latch on door when in locked position.

Top Plates—To be of such gauge sufficiently reinforced to carry superimposed loads. Both top and bottom plates to be securely welded in place except in large cases where knock-down construction is essential.

Cupboard and Pedestal (Hinge Doors)—Double Wall Construction

Inside Uprights—To be made of No. 20 or No. 18 gauge steel, depending on size, to be flanged at rear and with Z-shape formation at front for additional strength. These uprights to be perforated for adjustment 1 in. on centers. Bracket adjustment to be used at front. Rear of shelf to be hung on adjustment strips with lugs formed at intervals of 1 in.

Drawer Pedestal

Drawer pedestals shall be made with gauges the same and with construction very similar to pedestal construction described above with drawer strikes at proper intervals.

Drawer Construction

Outside Head—To be flat. Edges to be formed into a $\frac{5}{8}$ -in. box channel section with back turned flanges at sides and bottom and welded through these flanges to body. Top corners to be oxyacetylene welded to prevent opening of joints and all corners ground to a slight radius to eliminate sharp corners. Outside head with an area up to and including 130 sq. in. to be of No. 22 gauge, no reinforcement; over 130 sq. in. up to and including 198 sq. in., No. 22 gauge reinforced; above 198 sq. in., No. 20 gauge reinforced.

Inside Heads—To be of No. 24 gauge steel, formed or flanged on all edges, to be slipped into place after hardware has been applied. Approximately $\frac{1}{2}$ in. dead air space to be left between heads as a fire resistant.

Bodies—Sides bent up at right angles to bottom with top edges formed into a $\frac{5}{8}$ -in. sq. tubing section and rear edges flanged and electro-welded to back. Bodies up to and including 20x4 $\frac{1}{2}$ in. or equivalent area to be made of No. 24 gauge steel. Above this size No. 22 gauge shall be used.

Backs—To be made of No. 18 gauge steel.

Hardware—To be of design shown on drawings and securely fastened through outside heads. Where drawings so indicate, drawers in standing desks, tables and counters are to be constructed to pull out by reaching under head, eliminating projecting pulls. Where specified, locks shall be recessed into inside head, leaving inside of drawer smooth.

Suspensions—Drawers will be equipped with channel suspension, progressive suspension or Amco suspension, as requested.

ART METAL COUPON BOOTHS

ART METAL CONSTRUCTION COMPANY supplies coupon booths made to special design to fit the space available or assembles them, using standard partition

units as illustrated in the partition section. (See Art Metal in the Manufacturers' Index.)

ART METAL EQUIPMENT FOR PUBLIC BUILDINGS

Furnishings for public buildings have long formed an important part of Art Metal production. Throughout the country, government and state buildings, city halls, court houses, county clerks' offices, etc., are completely equipped with Art Metal products.

This equipment includes counters with or without files, cupboards or drawers below, document files, roller shelving for large record books, plan files, safes, desks, etc., down to letter trays and waste baskets.

Constructed of High Grade Steel .

Public building equipment is nearly always of steel. This insures long life under the extremely hard wear to which such equipment is subjected and also reduces the hazards of fire.

The sheet steel used in all Art Metal products is a high grade stock especially made for the product. Re-annealed to withstand sharp bending. It is patent leveled, full pickled to remove scale and all impurities, resquared and finally oiled to prevent rusting.

After fabrication the units are carefully filled and finished using slow-baking enamel or lacquers which have been developed through long years of testing and experience. The finish will never chip, flake or peel.

Cooperative Service

Art Metal engineers will gladly consult with architects and public officials and after ascertaining the requirements, will submit layout to care for the records most efficiently.

ART METAL LIBRARY EQUIPMENT

For a period of 40 years the ART METAL CONSTRUCTION COMPANY has been manufacturing *quality* steel library equipment.

During this time, development and research has been carried on to continuously improve and perfect the equipment.

Art Metal Steel Library Equipment is used in a large percentage of the modern libraries in this country as well as many foreign countries.

If the architect wishes to view an installation, the company will be glad to refer him to several in his community. Every state in the country, as well as practically every important city, has many Art Metal installations.

For a partial list, see Art Metal page 24.

The production of a complete line of modern fire-resisting steel equipment for libraries and museums of various kinds is a specialty of this company. The line of products is complete for the equipment of small private or town libraries to the great city libraries, such as the new Free Library of Philadelphia in which over 2,783,000 lb. of Art Metal Steel library equipment was used.

The Art Metal line includes not only the shelving for books but indexing systems, trucks, delivery desks, tables, display cases, magazine racks, metal furniture, iron or bronze railings, stairs and stack floor construction, as well as hollow metal trim and doors for the entire building. No order is too large for the Art Metal factories to handle.

DEFINITION OF ART METAL LIBRARY EQUIPMENT TERMS

Shelf Compartments

A unit of shelving one shelf wide between supports and extending one tier high. Standard height, 7 ft. 6 in., floor to floor and floor to cornice, but also furnished in heights to suit conditions.

Range

A row of shelf compartments placed end to end. Length is as required but it is advisable to have it in even multiples of the shelf unit adopted. A range may be single or double-faced.

Single-faced Range—A range that is usually placed on side or end walls with or without a back.

Double-faced Range—Two single-faced ranges back to back, with aisles at the front of each.

Tier

A number of ranges one story high placed side by side with aisle space between each.

Bookstack

A series of superimposed self-supporting tiers or an isolated tier.

Each tier is separated by a deck floor which is supported by the tier or tiers beneath.

Standard Bookstack—Consists of a number of removable book shelves supported by vertical shelf supports extending from floor to floor. The supports also extend the full depth of the shelves.

See Art Metal pages 15, 17 and 18.

Bracket Bookstack—Consists of a number of shelving units, each composed of a shelf and end brackets secured to each other as a solid steel unit by the Art Metal No Bolt Process.

The unit is hooked directly into slotted openings in the vertical column which extends the entire height of stack. Brackets extend full depth of shelves.

See Art Metal pages 15, 19 and 20.

PRELIMINARY DATA FOR THE ARCHITECT'S USE IN DESIGNING LIBRARIES

Ranges

Depth, single-faced without back 91½ in.
Depth, single-faced with back 81½ in.
Depth, double-faced without back 161¼ in.
Height, standard floor to floor 7 ft. 6 in.

Note: Height also variable to suit conditions.

Shelves

Depth, standard stack 71½ in.
Depth, standard stack (oversize) 101½ in.
Length, standard stack 36 to 42 in.
Depth, bracket stack 7 in.
Depth, bracket stack (oversize) 10 in.
Length, bracket stack 36 to 42 in.
Vertical depth, all shelves ¾ in.

Main or Corridor Aisles

Width, not less than 2 ft. 6 in.
Length: Blind at one end 12 ft.

Open both ends 18 ft.
Storage for seldom used books, up to 30 ft.

Stack Stairs

Number of risers for floor to floor height of
7 ft. 6 in. 12
Tread standard 10 in.
Well length 8 to 19 ft.
Width of stairs, average 2 ft. 6 in.
Approximate diameter of spiral stairs . . 4 ft. 2 in.

CAPACITY OF 7-IN. DEPTH SHELVES

Class of books	Volumes per ft. of shelf	Class of books	Volumes per ft. of shelf
Bound periodicals*...	5½	Law	6
Circulating	10	Medical*	6½
Economics	9	Public documents	6
Fiction	9	Reference works	8
General literature	8	Scientific	7
History	8	Technical	7

*10-in. shelf depth is better suited to these books.

HORACE TRUMBAUER, Architect

ART METAL STANDARD STACK SHELVES AND SHELF SUPPORTS

The Art Metal Standard Stack Compartment consists of two parts: The one-piece shelf support and the one-piece plate shelf. Both are made of smooth plates of steel, finished with baked-on enamel. There are no cast iron parts.

Shelf supports are U-shaped with a trifoil formation at the front and flanged at the rear for reinforcing.

In the front, the supports have horizontal slots incorporating the Art Metal Lock Shelf feature. These slots engage the projecting bearings or flanges on the ends of each shelf and provide a bearing which keeps the shelf firmly in position.

The supports are also perforated in the rear flange for further shelf support. Into these perforations falls the channel formation on the back of the shelf. By this means of construction and assembly the shelf has solid bearings at the extreme ends. The simplicity of these features is unusual, and any shelf may be easily removed without the use of tools and without disturbing other shelves.

The shelves are formed from single steel plates, shaped at the front and back in the form of a channel. This gives a finished appearance and reinforces the shelf at the same time. The ends of the shelves are also reinforced by shaping in the form of a flange, which also serves to lock the shelf in place.

The shelves will not warp, twist, split, shrink or swell and because of their hard, smooth surface can be readily cleaned. Shelves without perforations are recommended and usually furnished. Perforated shelves, to provide extra ventilation, may be had if desired.

Shelving may be any length required but should be of uniform length, if possible.

There are two kinds of shelf supports: Finished ends which are used at the ends of ranges, and partition or intermediate supports. Each of these is divided into two classes: Double-faced, where ranges have shelves accessible from both sides; and single-faced, where shelves are on one side only. The finished ends are entirely plain and smooth, with rounded edges. Where preferred, they may be paneled.

ART METAL BRACKET STACK SHELVES AND SHELF SUPPORTS

The "All Wrought" Bracket Shelf is made of steel, with front and back formed to a box or channel section which, with its smooth steel-plate brackets, makes a solid steel unit without intermediate part between itself and the standard. It is hooked directly into the slotted openings in the standard by stout lugs on the back of the bracket.

Framing for intermediate floors is introduced as in the Art Metal Standard Stack.

This type of shelving is light and easily handled, or stored, having no cast iron parts liable to breakage. It is entirely smooth, having no sharp openings that would crease or wear books and afford lodgement for dust. It is most durable, being built entirely of steel without loose parts.

This shelving is easily adjusted, being hooked directly into the supporting standard. It can be shifted by anyone without disturbing the books, no tools or spirit level being required for adjustment. Absolutely level shelves are assured by mathematic levels on the supporting standards.

Brackets have flanged edges so that books will not easily straddle them; thus the wear on books through handling at the stack is reduced to a minimum. The brackets are connected to the shelves by the Art Metal patented *no bolt* process.

Ranges have open ends, thus allowing free circulation of air and light.

Solid ends can be provided when it is desired to exclude direct sunlight.

ART METAL DECK FLOORS

Note: *The bottom floor of a stack room is not included with the deck floors and is usually not a part of the contract for equipment, but is installed by the contractor for the building.*

Between each pair of tiers there should be a deck floor of light structural framing supporting some solid material that is dust and waterproof, preferably marble, glass or slate.

Reinforced concrete slabs may also be used but are not recommended. Wood cannot be used to advantage for deck flooring as it multiplies noise, feeds fire, catches dust and dirt, is hard to keep clean, does not reflect light and is generally unsatisfactory.

Glass for floors is $\frac{3}{4}$ in. thick with top or floor side sand blasted to obscure the vision and make footing more secure.

It is bedded in a special cement putty with slabs leveled so that there are no projecting edges. In stack rooms having a skylight, glass floors permit light to pass through.

Marble is now generally used for deck floors in larger stack rooms. The marble should be $1\frac{1}{4}$ in. thick, sound and without pronounced veinings, with both sides sand rubbed. It is set in cement with joints neatly pointed.

Slate, while not frequently used, makes a satisfactory floor aside from its appearance and the fact that it does not reflect light. The under surface is often painted white to help reflect the light. Slate floors should be $1\frac{1}{4}$ in. thick and set in cement, joints neatly pointed and adjoining slabs leveled.

Total thickness of deck floors for ordinary spans up to 48 in. from top of floor to bottom of steel floor beam, is $3\frac{1}{2}$ in. plus the thickness of glass, marble or slate. When alcoves are large enough for reading tables, deck floors need heavier construction.

Along the face of each range there should be a horizontal or vertical deck slit of 2 to 3 in. wide or high for ventilation and light. These are protected by a curb angle as illustrated on Art Metal pages 17 to 20.

On this page is shown the two story standard stack in elevation and in plan. The elevation at the right shows the method of fastening and bracing. The end view at the center shows the location of label holders, light switches, etc. The sectional view of the left is taken at line A-A on the plan. It shows

the curb angle supporting second floor slab while the smaller sectional view shows the application of special shelves for large books, etc. At the top are shown plan views.

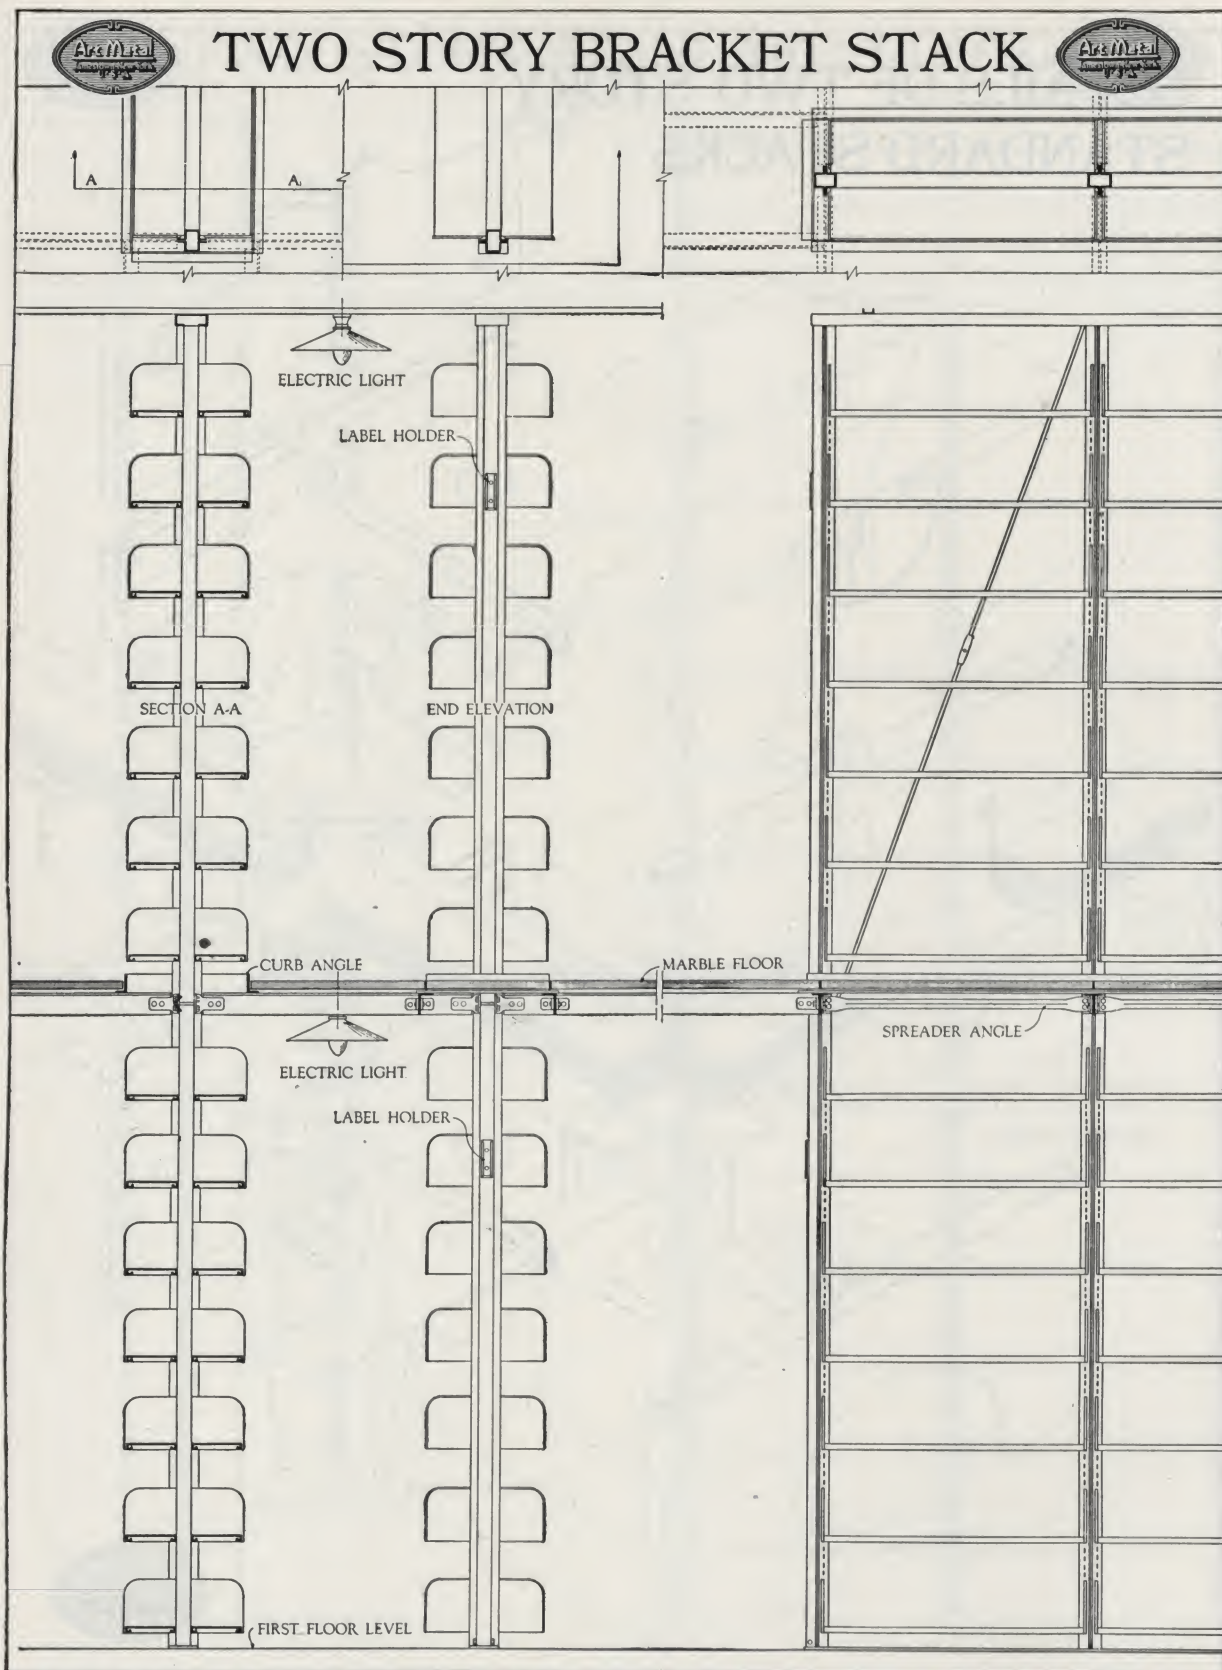

Details of construction are shown on the opposite page.

DETAILS OF TWO STORY STANDARD STACKS

On this page are shown the construction details of the two story standard stack.

The lower portion of the page shows the first story with the second story above. Note the columns which carry the load of the second story and the curb angles which support the floor slabs. The stack is braced by the spreader angles in both directions and the tie rods to form rigid structure.

On this page is shown the two story bracket stack in elevation and in plan. The front elevation at the right shows the method of fastening and bracing the stack. The end elevation in the center shows the bracket stack ends, location of

label holder, etc. The sectional view at the left is taken at line A-A on the plan. It shows the curb angle supporting the second floor slabs. At the top are plan views. Details of construction are shown on the opposite page.

DETAILS OF TWO STORY BRACKET STACKS

On this page are shown the construction details of the two story bracket stack. Note the tubular construction of the columns which extend the full height of the stack and carry the second story load and also form supports for the shelves.

Where the loads require it, reinforcing channels are placed inside the columns as shown on page 14. The stack is braced by the spreader angles in both directions and by tie rods to form a rigid structure.

ART METAL LIBRARY ACCESSORIES AND GENERAL EQUIPMENT

Stack Accessories

The list of accessories that can be provided where desired includes label holders for ends of stacks, shelf label holders, range finders, book supports of different types, portable reference shelves, perforated shelves, roller shelves, etc.

Railings and Stairways

Railings for galleries across open ends of stack decks and open stairways should be in keeping with the design of the library interior. Stairs located between the finished backs of two adjacent single-faced ranges are provided with either steel, bronze or wood handrail as desired.

Below are shown standard railings of designs particularly adapted for use in libraries. Class "A" is a plain design used largely in stack rooms on stairways and around stairwells.

Class "B" and "C" are more elaborate designs used for the same purpose and also used on balconies.

Class "D," "E" and "F" are ornamental railings suitable to all conditions in a library where a railing of more artistic design is desired.

Class "A" railing has a 2-in. steel tubing handrail fitted into a channel top member to which are attached the $\frac{5}{8}$ -in. square wrought iron vertical rails. The lower ends of vertical members are attached to a $\frac{3}{4}$ in. by $\frac{3}{8}$ -in. channel. Posts are 1 in. square wrought iron.

Class "B" and "C" railings have 2-in. bronze tubing handrails fitted into channel. The horizontal members are 1 in. by $\frac{3}{8}$ in. steel bars into which are fitted the $\frac{5}{8}$ -in. square tubing vertical members. Posts are 1-in. square steel bars.

Class "D" railing is built up of bars with 2-in. bronze handrail, posts being 1-in. square steel bars.

Class "E" railing is similar to Class "A" with the addition of cast ornaments applied to three of the vertical members in the center of each section between posts.

Class "F" railing has a 2-in. bronze tubing handrail fitted into a channel, the two intermediate horizontal members through which the vertical members are mortised consist of $1\frac{1}{2}$ in. by $\frac{1}{2}$ -in. bars.

The bottom member consists of a $\frac{3}{4}$ in. by $\frac{3}{8}$ -in. channel to which are attached all vertical $\frac{5}{8}$ -in. square bars as well as the $\frac{3}{4}$ -in. square bars at each side of the ornamental panel occurring at the center of each section between 1-in. square posts.

The ornamental panel is built up from $\frac{3}{4}$ in. by $\frac{1}{2}$ -in. bars and cast ornamentations.

The finish used for all railings is a baked enamel with a brushed bronze finish for bronze handrails.

Stack Stairs

Main corridors should connect the aisles between the ranges of each tier and the tiers should be connected vertically by stairs and lifts. For standard stair dimensions, see Art Metal page 11.

Stairs are frequently placed between two parallel ranges thus saving floor space. As a rule, stairs should be near the center of the stack. They are made of cold-rolled steel which gives a better surface for applying the baked-on enamel finish.

Treads of various kinds are available: Corrugated rubber, safety tread, marble, glass, slate or linoleum.

Booklifts

Booklifts are regularly supplied for operation by a handpower mechanism with automatic brakes which hold the car where it is stopped. Car is made of brass mesh or wood and has a capacity of 100 lb. Booklift enclosures consist of corner posts to which are bolted steel panels. An opening is provided at each stack level. These openings are covered with slide down or swing doors. A steel shelf 6 in. deep is provided at each opening to assist in placing books on and removing them from the lift. An access door to the machinery is provided at the top of the enclosure.

Electrically operated can also be furnished when ordered.

Cubicle Partitions

Metal partitions for providing study rooms or cubicles can be furnished with a reference shelf that will serve as a work table, and adjustable shelves on which books may be placed within convenient reach of the student.

Bronze Museum Cases

These cases are constructed of architectural extruded bronze shapes. All joints are of dustproof construction.

All corners of doors and case panels to be securely fastened together by means of concealed connection angles. All panels of case are held in position by means of concealed sliding lock bars.

Glass or Vehisote panels optional and are cemented in the bronze frames so as to make a dustproof joint and absolutely rigid construction.

Cases can be had with removable panels or hinged doors fitted with locks.

Cases are made to any specified size for mounting on tables, sanitary or closed bases.

For illustration, see page 24.

Delivery Counters

A typical Art Metal Counter for library requirements is shown below. Charging card trays are placed in the top of the counter and are protected by a disappearing cover. The rear of the counter is equipped with card index drawers, cash drawers, storage cupboards and open shelving for returned book storage.

Book Trucks

Facilitate handling of books between stack room, delivery counter or other departments. Art Metal

Trucks for this purpose are built entirely of steel and have baked enamel finish. Trucks are equipped with ball bearing wheels and casters with either rubber or aluminum tires.

Reading Room Equipment

Art Metal equipment for reading rooms includes folio cases, periodical racks and newspaper racks. In smaller libraries the periodical and newspaper racks are placed on casters for ease in moving about the room.

The newspaper or periodical is tightly held and locked in a specially designed holder. Only a small part of the margin is covered by the holder and all inside columns are exposed with margin to spare.

All equipment is made of steel and finished with the durable baked enamel.

Electrical Equipment

The furnishing and installing of rigid conduit fittings, receptacles and switches may be included with the contract for stacks, but not the wiring and furnishing of lamps.

Conduit risers extend on the underside of each deck floor.

Horizontal conduits to carry the wires are supported in the deck floor construction.

Lights in the aisles between ranges should be located 6 ft. apart and controlled by switches countersunk in the finished ends of the ranges. Main aisle or corridor lights may be located 12 ft. apart and should be controlled by switches adjacent to stack room entrances, or at foot or head of stairways.

Single or double switches may be used to control range aisle lights. Three-way switches are very convenient where ranges are open at both ends and 12 ft. or longer.

JAMESTOWN METAL EQUIPMENT COMPANY

INCORPORATED

Metal Furniture and Equipment for Banks, Hospitals, Libraries, General Offices and Public Buildings

GENERAL OFFICE AND FACTORY

JAMESTOWN, N. Y.

NEW YORK CITY OFFICE, 205 East 42nd Street

Products

FURNITURE and EQUIPMENT in METAL:
Bank Equipment; Library Stacks; Metal Furniture for Offices; Metal Equipment for Hospitals; Steel Shelving; Metal Partitions; Courthouse Fixtures; Vault Interiors.

Furnished in stock designs and built to architects' specifications.

Construction

Designing and engineering is under the supervision of capable men who have had long experience in building steel equipment of quality. The materials are carefully selected from the most suitable stocks and fabricated with modern machinery and equipment by skilled craftsmen. Architects are invited to refer inquiries to us for estimates, submission drawings or details of construction. This service is furnished without cost or obligation.

TRADE-MARK

Quality

Jameco equipment is built to give uninterrupted service and the utmost efficiency in a minimum space. Careful attention is given each detail of construction and all finishes are oven baked to make their beauty permanent.

The handsome appearance of Jameco equipment is the result of well balanced design and many refinements of construction that experience has shown to be essential to a good product.

Deliveries

Shipment and installation schedules are under constant supervision and delivery is made to conform with the requirements of each project.

Catalogue

Complete catalogues of Jameco Products will be mailed upon request.

The Company and Its Services

THE SIKES COMPANY offers a broad service to architects interested in chairs specially suited to their environments.

There are Sikes Chairs in over 500 standard designs for the executive office, the boardroom, the general office, the bank, the school, the public building. Moreover a Department of Design executes new and interesting patterns for special uses.

We are glad to co-operate with architects in the selection of furniture suitable for each use. This service includes drawing up tentative designs for criticism, planning complete layouts, recommending furniture arrangements, color schemes, drapes, floor coverings, etc. This service is advanced without cost or obligation. It is authoritative, based on an experience of seventy years. Write for the complete catalogue, describing the nature of your requirements.

Some Sikes Construction Features

(1) Rim is fastened at every point of contact with double dowels, making it one solid unit.

(2) Stretchers are chuck doweled, *glued and bradded*.

(3) Notch on the back legs, deep enough to take the full thickness of the stretcher and relieve the strain on the dowel.

(4) Each back leg forms its own corner block. The making of leg and block in one joint adds immensely to the strength of this joint.

(5) Corner blocks firmly fastened by both glue and screws give additional strength at these points.

of something even better—a chilled steel pivot operating in a bath of lubricant. This pivot, which carries the weight of the chair, revolves with the smoothness, ease and silence of the jewel bearing in a watch. The lubricant, being in an enclosed well, cannot escape and its evaporation is a matter of years. Under ordinary conditions the original lubrication, given at the factory, should last fifteen to twenty years.

New Improved Swivel Mechanism Used on All Sikes Revolving Chairs

This is the first chair iron in which provision is made for *long time* lubrication of that part of the iron which carries the load.

After years of experiment and observation of chairs in actual use, we discarded ball bearings in favor

The Sikes Line

Today, the Sikes line of office chairs consists of nearly 500 different models. On this page is shown a few of the many Sikes designs. It is impossible in this limited space to give a full idea of the Sikes line. A complete catalogue will be forwarded to any architect on request.

Sikes Office Easy Chairs

BASSICK FLOOR PROTECTION EQUIPMENT

MANUFACTURED BY
THE BASSICK COMPANY
BRIDGEPORT, CONN.

FLOOR PROTECTION WITH BASSICK NOMAR FURNITURE RESTS

A Positive Protection Against Marring of Soft Floors of Linoleum, Cork, Rubber

This information should be of particular interest to architects, for they may best serve the interests of their clients by recommending the installation of floor protection equipment.

Neat in Appearance

The dark brown Atlasite base adds a finishing touch of neat appearance to the furniture leg.

Durable

The Atlasite in the base is a special composition with a polished hard surface, which will not break, crack or chip under severe service.

Tilt

Every NoMar Rest has a flexible joint which allows the base to remain flat on floor when furniture is tilted. This is a very important feature when used on chairs. It prevents sharp edges of legs from digging into floors.

Quiet

The joint of the NoMar Rest is made with a spring tension to prevent rattles and chatter when furniture is moved.

Tilting Joint Keeps the Broad Base Flat on the Floor

Atlasite Base Will Not Break, Chip or Rust

SPECIFICATIONAL DATA BASSICK FLOOR PROTECTION EQUIPMENT

The "Drive-On" NoMar

Easy to Apply—Will Not Split

This type on furniture which has never been equipped with casters or bored for caster sockets, eliminates the necessity of boring holes.

A driving tool furnished with each set and a hammer will do the job as easy as driving a nail. A patented hollow driving tube gives a positive grip—it will not come off.

No.	Diam. of base, in.	List price, set of 4
NR-10	1 1/4	\$0.50
NR-20	1 1/2	.60
NR-30	2	.70
NR-40	2 1/2	1.00

The "Socket" NoMar

For Use with Grip Neck Caster Sockets

The "Socket" type NoMar is furnished with standard 3/8-in. grip neck caster sockets. Where it is desirable to replace casters or where furniture legs have caster socket holes this type should be used.

No.	Diam. of base, in.	List price, set of 4
NR-1	1 1/4	\$0.50
NR-2	1 1/2	.60
NR-3	2	.70
NR-4	2 1/2	1.00

Bassick NoMar Desk Cups

For Use Under Round or Square Desk Legs, Stove Legs, Radiator Legs, etc.

Made of brown Atlasite, neat in appearance and unbreakable these cups fill a need for attractive durable floor protection. No. NDC-6 is especially adaptable for use as a caster cup. A curved depression in the center holds the caster wheel firmly in place.

No.	Size of opening, in.	List price, set of 4
NDC-125 Square	1 1/2	\$0.90
NDC-225 Square	1 3/4	1.00
NDC-325 Square	2	1.30
NDC-6 Round	1 3/8	.60
NDC-7 Round	1 1/2	.80

BASSICK CASTERS

THE BASSICK COMPANY, one of the largest manufacturers of casters, makes a complete line of casters for every purpose. Information re-

garding proper types of casters for any furniture or equipment for use on all kinds of floor will gladly be furnished on request.

Note: These products can be secured through leading hardware distributors and dealers, office supply houses or direct from the manufacturer.

STEEL LOCKERS.

Also Shelving, Storage Cabinets, Wardrobes, Filing Cabinets and Light Weight Fireproof Safes. For our pages on Metal Building Material, see Manufacturers' Index.

Berloy Steel Lockers

Made in designs and sizes to meet every locker need and have every construction advantage which makes for long life and freedom from repairs. *More than one million are now in use throughout the world.*

Material—Two-pass deoxidized stretcher leveled steel. This material is all made in our own mills from ore to finished sheet and given special processes to insure perfectly level sheets with smooth surfaces. The door frame is also made of sheet metal same as balance of locker and matches up perfectly.

The Unit Principle of Construction—Followed throughout gives great flexibility of arrangement. As many or as few lockers as desired may be built into any group and rearrangement of any equipment is easily and quickly accomplished.

STANDARD SIZES OF BERLOY STEEL LOCKERS

Combination Lockers Type G

No. 2860—5 small compartments, each 15 in. wide, 21 in. deep and 15 in. high; 1 small compartment 21 in. wide, 18 in. deep and 15 in. high; 1 large compartment 18 in. wide, 18 in. deep and 60 in. high.

Details of Berloy Steel Lockers

Type S.S. Single Tier

All of the parts are punched and formed over standard dies which make all corresponding parts uniform. This makes it possible to rearrange lockers at any time. (Note dissected view which illustrates clearly how parts are assembled.)

Doors—Made of 20 gauge steel with a ¾x1½-in. filleted tubular reinforcement at inner edge of door and two ¾x¾-in. filleted tubular reinforcements at outside edge. Entire door made of one piece of steel welded together. Lock cannot be removed from outside of door as no lock bolts appear on outside.

Ventilation—Types S.S., S.D., F.S. and F.D. hooded slots or louvers are embossed in the field of the doors. These are not mere slits in the metal, but are roomy louvers measuring 5½ in. wide and extending ¼ in. from face of door. They assure ample ventilation, while the hoods furnish protection against dust, dirt, theft, and fire originating in the locker.

Positive Latching Device—Locking bar operates between the two tubular reinforcements at the outside edge of door and runs the full length of door. Both the locking clip on the door and the locking lug on door frame are made of heavy 13 gauge steel. Both the locking clip and lug are scientifically designed so as to force door to positively latch when closed. A silencing feature permits locking bar to drop into locked position with minimum noise.

Lockers Recessed in Corridor Walls

These accompanying details are given to show the size opening required for the recessing of locker equipment. The

SINGLE TIER LOCKER

DOUBLE TIER LOCKER

height of the opening for recessed lockers should be at least 2 in. greater than the over-all height of the locker without legs. Depth of recess to be 1 in. greater than depth of locker. Width of recesses should be 2 in. greater than the over-all width of the total number of lockers in the group.

Example, five lockers 12 in. wide, 12 in. deep by 60 in. high, without legs, recess in one group, the opening should be 5 ft. 2 in. wide, 13 in. deep, 62 in. high.

Manufacturer's Specifications of Lyon Steel Lockers

Single Tier Locker
WIDTHS AND DEPTHS,
IN.

60-in. hts.		72-in. hts.	
W	D	W	D
12	12	12	12
12	15	12	15
12	18	12	18
15	15	15	15
15	18	15	18
18	18	18	18
18	21	18	21

Doors—Full cold rolled, patent leveled, 20-gauge furniture steel, formed with channel shape reinforcement at each vertical edge, providing double thickness of steel where locking device and hinges are attached. Top and bottom are flanged and all joints and corners electrically welded.

Frames—Both vertical and horizontal members are 1x1x $\frac{1}{8}$ in. hard steel angles. Joints rabbeted and electrically welded.

Body—24 gauge steel, flanged at all sides to give a double thickness of metal at each edge.

Tops—Flat, unless sloping tops are specified.

Hinges—Full looped hinges—3 hinges on 60-in. and 72-in. high doors; 2 hinges on 36-in. and 42-in. high doors.

Ventilation—Standard louver perforations 5 in. wide by $\frac{1}{4}$ in. deep.

Locking Device—Three point locking device on single tier lockers; two point locking device on double tier lockers. Gravity locking bar remains up when door opens. Closing the door releases locking bar which drops quietly into place.

Locks—Masterkeyed flat key locks with two keys each. Combina-

tion locks or padlocks can be furnished when specified.

Legs—Front legs are integral with frame. Rear legs are 1x1x $\frac{1}{8}$ in. hard angle. Fitted with adjustable feet.

Number Plates—Brass, with $\frac{1}{2}$ -in. etched black enameled numerals.

Equipment—Single tier locker, one hat shelf. Double tier locker, no shelf. 12-in. wide lockers have 3 single prong and 1 double prong ball pointed, rustproofed coat hooks. Over 12-in. widths, 4 single and 1 double prong hooks.

Silencing Devices—Rubber cushions at all points where door strikes jamb, and where lock trigger passes through door. Gravity locking device, which eliminates noise due to locking mechanism "riding over" jamb.

Finish—Standard finishes—Lyon green or Lyon gray baked enamel. Coat hooks, cadmium plated. Bolts Parkerized.

Recessing—Complete details in our locker handbook No. 209.

Erection—All lockers shipped knocked down. We can erect or furnish erection superintendent.

A complete set of architects drawings, A.I.A. File No. 28a-1, showing locker details will be gladly sent upon request.

Locker Specifications

Doors—Full cold rolled, patent leveled No. 20 gauge special enameling steel with tubular reinforcement at each vertical edge and hemmed flange at each horizontal edge.

Frames—Uprights, 1x1½ in. hard steel angles; cross members, 1½x¾ in. No. 14 gauge formed steel channels, joined by two ⅝ in. countersunk rivets at each corner.

Body—The remaining parts of locker are made of No. 24 gauge steel.

Locking Device—Concealed type operated by stamped steel (not cast) straight lift handle with curled grip which provides ample space for comfortable hand-hold, latching automatically and quietly when door is closed.

Lock Fingers—Improved design with rubber silencers. Three on both single tier and double tier standard lockers.

Padlocking Attachment—This attachment complete with rubber silencers furnished on standard single and double tier lockers at no extra cost.

Locks—Masterkeyed flat key locks (with two German Silver keys each) fastened to inside of door without exposed bolt heads. Combination locks or padlocks can be furnished when specified.

Hinges—Reinforced, full-looped, 5-knuckle "strap" hinge permitting door to open approximately 180 degrees.

Legs—Front legs integral with frame. Adjustable feet furnished. Rear legs also adjustable.

Tops—All lockers have flat tops unless sloping tops are specified.

Ventilation—Standard louver perforations in doors, "safety type" 4½ in. wide, ⅝ in. deep.

Equipment—Single tier, one hat shelf 9 in. from top; double tier, no shelf. 12 in. wide lockers, one double prong ceiling and three single prong side hooks. Lockers more than 12 in. wide, one double prong ceiling and four single prong side hooks. All hooks arranged for attaching with two bolts.

Coat rods, mirrors, comb trays, towel rods, umbrella racks, drip pans, golf ball trays, golf bag chains, drawers and other special equipment to order.

Finish—Standard No. 307 olive green baked enamel and No. 213 standard gray baked enamel. Other colors at reasonable cost. Coat hooks, Udylyte finish. Bolts and nuts parkerized. All outside bolt heads are slotless type.

Number Plates—Polished brass with ⅞-in. black filled numerals.

Sizes—Widths: 12, 15, and 18 in.; depths: 12, 15, 18, 21 and 24 in.; heights: 60 and 72 in. single tier; 30, 36 and 42 in. double tier.

*Overall height with standard legs is 6 in. greater than nominal heights listed.

Multiple Tier (Box) Lockers

Multiple Tier Lockers conform in general with specifications of standard lockers with following exceptions:

Doors—Full cold rolled, patent leveled No. 16 gauge special enameling steel, flanged on all edges.

Frames—Same as standard lockers with No. 20 gauge intermediate channel cross members between door openings.

Combination Handle and Padlock Attachment—All Multiple Tier Lockers are furnished with neatly formed stamped steel (not cast) straight-pull curl handle combined with padlock attachment. When doors are closed, spring clips keep them shut.

Equipment—No hooks or shelves.

Sizes—Widths: 12, 15 and 18 in.; depths: 12, 15, 18, and 21 in.; heights: 12, 15 and 18 in. Usually furnished in tiers four to six high. Also combinations of lockers and Multiple Tier Lockers in all sizes.

Top and End Finishing Strips

The perfect fitting top and end finishing strips are by far the neatest and most attractive trim ever furnished for recessed locker installations. Durabilt Finishing Strips project ⅜ in. in front of the face of locker. The edge of top strip adjacent to locker is offset ⅜ in. to overlap the locker. End strips do not overlap but to project ⅜ in. in front of locker same as top strip. Our strips are easily attached by means of concealed screws and joint clips. When the joint clips are engaged there is a spring contact which holds the finishing strips in alignment with a smooth, flush butt joint.

Additional Information

For additional locker information telephone our nearest sales office or write us direct at Aurora for a copy of Folder No. 6000. No obligation incurred.

Top and End Finishing Strips

Gymnasium Lockers

A complete unit consists of one standard single tier locker with multiple tier lockers, 2 or 3 high (depending on size) in sections of 1, 2, 3, or 4 wide.

Padlocks are most practical to use with gym type lockers.

Equipment—Each large compartment has one hat shelf. Small compartments have none. All compartments have one double prong ceiling and three or more single prong side hooks (depending on size of locker). Large compartment doors are standard single tier locker construction. Doors on small compartments are multiple tier (box) locker construction.

Small Compartments

W. D. H.*	
6' x 12x30"	Double Tier Arrangement
6' x 15x36"	Double Tier Arrangement
7½' x 12x30"	Double Tier Arrangement
7½' x 15x36"	Double Tier Arrangement
9' x 12x20"	Triple Tier Arrangement
9' x 15x24"	Triple Tier Arrangement

Large Compartments

W. D. H.*	W. D. H.*
12x12x60"	15x15x60"
12x15x72"	15x15x72"

Two-in-One Lockers

W. D. H.

15x15x72"	without coat rod
15x18x72"	with coat rod
15x21x72"	with coat rod

Coat compartments are 7½ in. wide x 54 in. high. Hat compartments are 15 in. wide x 9 in. high, making total height 72 in. exclusive of legs.

Equipment—One double prong ceiling hook and two or more single prong side hooks, depending on size of locker. Lockers 18 in. deep and over have a coat rod in addition to hook equipment.

Two Person Lockers

W. D. H.*

15x12x60"	15x12x72"
15x15x60"	15x15x72"
15x18x60"	15x18x72"
15x21x72"	

Equipment consists of two hat shelves, vertical partition dividing lower part into two coat compartments each having one double prong ceiling and two or more single prong side hooks, depending on size of locker. Can be furnished without partition when desired.

"Doorless" Lockers with Trays

Equipment consists of 19 3-in. trays in 60 in. high and 23 3-in. trays in 72 in. high lockers. Trays are removable. These steel lockers can be furnished with doors if desired. Can also be made without legs for recessing in walls when desired.

Co-operation

We welcome the opportunity of working with you on your storage problems when plans are in the formative stages. It is then that our "Specialized Knowledge" will prove most profitable to you. For further information phone our nearest sales office or write us direct at Aurora. Literature will be gladly sent on request without obligation to you.

Cabinet Construction Features

Cabinet doors, back, top, bottom, sides, and storage shelves are of full cold rolled patent leveled No. 20 gauge enameling steel—rolled to our own specifications.

The door frame is made by interlocking the top, bottom and sides. It is offset where doors overlap, assuring a close fit. Doors are reinforced in center with full length panel, spot welded to inside, which makes them exceptionally strong and rigid. The front, sides, and top are free from unsightly bolt heads or screws. These features make Durabilt Cabinets unusually secure, dustproof, fire-retarding and verminproof.

Positive Locking Device and Handle—The locking device consists of a special, triple action, straight throw, mechanism operated by an attractively designed nickel plated lever type handle. Vertical locking bolts which are concealed in tubular reinforcement engage holes at top and bottom of door frame while a heavy, horizontal bolt locks doors at center.

Secure Locks—Durabilt Steel Locker Co. special cabinet locks are standard on all cabinets with doors. Locks are so attached that it is impossible to chisel bolts off when doors are locked.

Exceptionally Strong Hinges—Our special designed strong strap hinge is so attached that no bolt heads appear on exterior of doors. The hinge construction also permits doors to open all the way back against sides so as not to take up valuable aisle space.

Attractive Color Finish—The rich "Satin Texture" olive green finish on Durabilt Cabinets which harmonizes with any interior trim makes them both permanently beautiful and dignified in appearance. (Other colors may be had at slight extra cost.)

Complete Range of Sizes—Durabilt Cabinets are available in various widths, depths and heights, and the line covers cabinets in both one and two-door types as well as cabinets without doors. All Cabinet dimensions listed are overall. Door openings are 3 in. less in width and 7 in. less in height than nominal dimensions given under illustrations.

Interior Equipment—The following can be furnished:

Storage, wardrobe, and combination shelves; full length and short partitions, also half width shelves for attaching to same; shelf partitions; shelf trays; plain, tool and blue print drawers; drawer dividers, partitions, and separators; bin fronts and extensions; Indian club and dumb-bell racks; milling cutter panels; key panels; and various other standardized parts which permit of easy attaching without drilling any extra holes, etc.

Wardrobe or Storage Cabinet

(One Door)
W. D. H.
19½x18x66 in.
19½x21x66 in.
19½x21x78 in.

This one door cabinet is furnished with adjustable wardrobe shelf assembly with coat rod and four double prong ceiling hooks. Storage shelves can be inserted when desired without the use of special tools.

Combination Wardrobe and Lavatory Cabinets

W. D. H.
30x18x78 in.
30x21x78 in.
30x24x78 in.

A standard Durabilt Cabinet in every respect except that it has a special short back to which the following equipment is attached: mirror, comb and brush shelf; soap dish; tumbler holder; also electric light fixture with convenience outlet. A towel rod is bolted to inside of top flange. (Can be furnished without special back and equipment, if desired.) Standard wardrobe cabinet furnished same size as lavatory cabinet when used in combination with it. Wardrobe equipment consists of shelf for hats and parcels; coat rod and six double prong ceiling hooks.

Durabilt Hospital Cabinets

Private Room Cabinet "Built-in" Type—Hospital units of this type, either "built-in" or "portable" have one, two or three 19½ in. wide wardrobe sections (depending on number of patients to be accommodated) and a section consisting of one storage compartment above a utility compartment. For one and two patient units, the latter section is 19½ in. wide. In the three patient units, it is 24 in. wide with double doors. For four or more patients, use combinations of these units best suited to your requirements. These cabinets are usually furnished in 78-in. heights and 21-in. depths.

W. D. H.

Small—15x6x30 in.

Large—24x6x30 in.

The 15-in. wide cabinet furnished with 100 to 600 key hooks as follows:

Panel on back only—

100 hooks.

Panel on back and

panel on door—200 hooks.

Panel on back and one

swinging leaf—300 hooks.

Panel on back, panel on

door and one swinging

leaf—400 hooks.

Panel on back and two

swinging leaves—500 hooks.

Panel on back, panel

on door and two swinging

leaves—600 hooks.

Above arrangements in

a 24-in. wide cabinet

would provide twice as

many hooks. (Each hook

will hold five locker keys

but hanging capacity is re-

duced when larger keys

are stored.)

Each combination hook

and number or label holder

is adjustable horizontally on

1-in. centers and vertically

on 2½-in. centers. No tools

required.

Durabilt Blue Print, Map and Plan Cabinets

Any size Durabilt Steel Cabinet may be equipped with sliding drawers with tilting suspension for the safe and convenient storage of drawings, tracings, blue prints, charts, graphs, photographs, decalcomania, printing plates, electros, small tools, bits, screws, etc., and thousands of other items.

Sliding drawers are furnished in 2, 3, 4, 5, 6, 8, 10 and 12 in. depths overall. They can be perforated for attaching front to back and left to right partitions—thus making it easy to arrange for storing items of various dimensions with the minimum loss of space.

Accidental pulling out of the drawers is prevented by the Durabilt concealed drawer lock which can be easily released by a half turn with a screw driver. As many or as few drawers can be placed in a Durabilt cabinet as present needs would require—more can be added later as the demand arises.

Locks can also be furnished when ordered on drawers 3 in. or higher.

Blue Print, Map and Plan Cabinets

W. D. H.
36x18x42, 66 or 78 in.
36x21x42, 66 or 78 in.
36x24x42 or 78 in.

Equipment includes: sliding drawers with tilting suspension, blue print flap at front and hood at rear, drawer pulls and label holder.

Products

Makers of SNEAD STANDARD BOOKSTACKS, SNEAD SHEET METAL BRACKET STACKS and NEWSPAPER STACKS for University, College, Public and Special Libraries.

For pages on ArmorGrids and Steel Partitions for office and factory, see Manufacturers' Index.

Snead Standard Stacks

The Snead Standard Stack has been installed in the majority of the most important libraries. This shelving is suitable for small installations consisting of a single stack tier (story) as well as for multi-tier (story) installations in larger library buildings. The end uprights of the Snead Standard Stack are fabricated of cast iron or sheet steel and may be had in several designs. The cast iron upright lends itself particularly well to various designs, finishes, color effects, etc., to harmonize with the architecture and color scheme of the room in which it is installed. The uprights are manufactured in one-tier heights, and are superimposed one over the other to obtain the desired number of tiers. Such uprights occupy the minimum space and are entirely free from dirt and dust collecting hollow spaces.

Deck floors or galleries between tiers give direct access to all shelves. The steel stack structure can be economically designed to carry overhead roofs and floors, without concentrated loads, and to brace the walls of the stack room.

The adjustable shelves may be either of the solid plate type, or, preferably, of the special Snead Open Bar construction, which is light, strong, resilient and

has dust collecting surfaces reduced to a minimum. Top cover plates protect books from dust and injury.

The interchangeability of parts and the flexible design of Snead Standard Stacks allow them to be readily taken down, re-erected, and extended both horizontally and vertically.

The construction of the uprights and of the shelves, as well as the special slit along the face of the ranges, facilitates the heating and ventilating of the entire unit.

The adjustable shelves are completely finished at the factory with baked-on ebony black rubber japan. All fixed metal parts are finished after erection with air-drying paint and enamel.

Snead Bracket Stacks

Bracket stacks consist of vertical tubular steel columns which may be superimposed one above the other to form a series of stack tiers. Solid plate shelves attached to brackets are cantilevered from the vertical tubular steel columns.

One-tier bracket stacks may be furnished free standing and require no attachment to the walls of the room in which they are installed. The shelves and columns are fabricated of cold rolled steel, finished with smooth, wear-resisting baked enamel, usually in olive green. If desired, the shelves may be factory finished in baked-on ebony black japan, the most durable finish known, without additional cost, or the entire equipment may be finished in any standard plain color at slightly increased cost. The structural steel framing is painted in the field to match the color of the stack.

Snead Standard Type A Stack in Library of Congress
DAVID LYNN and PIERSON & WILSON, Architects

Snead Steel Bracket Stack in San Francisco Public Library
GEORGE W. KELHAM, Architect

Snead Standard Type B Bookstack

16-in. double faced range. Similar single faced ranges also supplied. These ranges are 7 ft. 4 in. high over all and are carried in stock

General

The distance between main building floors should be an even multiple of the desired stack tier height (preferably 7 ft. or 7 ft. 6 in.) so as to line up the main building floors with the stack deck floors.

Service

The Snead staff of library experts is available for consultation, criticism, layouts and estimates, all without obligation. From a simple installation of wall shelving or a free-standing range to a fifty-tier tower stack—nothing is too small nor too large for SNEAD & COMPANY's attention.

Complete architectural and engineering information on bookstacks, as well as a host of valuable examples of Library plans and designs are given in the large book on Library Planning published by SNEAD & COMPANY, which, if desired, is obtainable on request by owners, architects and librarians.

Particular care has been given to the development of satisfactory lighting systems, featuring the Snead Stack Aisle Light Reflector. Snead engineers have also developed the Snead Book Distributor, and the Snead Heating and Ventilating Systems. Information will be gladly furnished upon request.

BOOK CAPACITIES

Average per lineal foot of shelf

U. S. Patent Specifications	2 volumes
Law, public documents, bound periodicals	6 volumes
Medicine and science	7 volumes
Reference and general literature	8 volumes
Economics and fiction	9 volumes
Circulating books	9 to 10 volumes

STANDARD STACK DIMENSIONS

Special sizes built to order if quantity warrants
Shelf widths—For books, 8, 9, 10 and 12 in.; newspapers, 18 and 22 in.
Shelf lengths—3 ft. usual—varied to suit conditions
Tier heights—7 ft. to 7 ft. 6 in.
Aisle widths—Main, 2 ft. 6 in. to 5 ft.; minor, about 28 in. minimum, 30 to 36 in. average.

STANDARD STACK WEIGHTS

Uprights and shelves	7 to 10 lbs. per cu. ft. of range
Books	20 to 25 lbs. per cu. ft. of range
Deck framing	5 lbs. per sq. ft.
Deck flooring, $\frac{3}{4}$ -in. glass	10 lbs. per sq. ft.
Deck flooring, $1\frac{1}{4}$ -in. marble	18 lbs. per sq. ft.

Snead Free Standing Bracket Stack

20-in. double-faced range. Similar single-faced ranges also supplied. These ranges are 7 ft. 3 in. high over all and are carried in stock.

The same uprights will take shelves of different width, adjustable in height at 1-in. intervals. A handy man with wrench and screwdriver can erect such a range in a few minutes.

No attachment necessary to floor, walls or ceiling

TRADE-MARK

Sixty Years' Experience at Your Service

A force of engineers with a background of 60 years' experience in design, fabrication and installation will submit layouts, recommendations and estimates without obligation.

Penco Steel Shelves

Simple, durable, exceptionally strong and fully interchangeable. Readily erected with the aid of only a screwdriver. Quickly disassembled and re-erected.

Penco Standard Specifications—Uprights made of No. 14 gauge cold formed angles, 3, 6, 7, 8, 9 and 10 ft. high. A combination of the above will give any desired height. Punched for 2-in. adjustment.

S104

S101

Shelves are 9, 12, 15, 18, 24, 30 and 36 in. deep, 24, 30, 36, 42, and 48 in. wide, made of No. 18 gauge steel. Reinforcing angles are supplied for heavy duty shelving. The 24 and 30-in. widths are used to fill out shelving in lengths not a multiple of 36 in.

Flat steel backs and divisions, same heights as uprights, are punched for attaching to flanges of the uprights and shelves, and at equal distances from top and bottom edges to make them reversible.

Dividers of No. 24 gauge are 6, 8, 10, 12, 14, 16, 18 and 24 in. high by all shelf depths. (Flanged top and bottom for bolting to adjoining shelves). Beaded front and back.

Bin fronts (with continuous label holders when desired) are readily attached to uprights by steel clips.

Counter shelves and hinged doors with locks also supplied.

Finish is olive green baked enamel. Special finishes at additional cost.

Special shelving made in accordance with specifications or requirements. Blue prints and estimates on request.

Penco Tinclad and Kalamein Doors

Tinclad Door

Standard equipment in office buildings, hotels, apartments, schools, hospitals, etc. Made to exact specification in any size or type, and installed by experts.

Kalamein Door

Penco Steel Lockers

Penco steel lockers are made of cold rolled steel, in single tier (full height) and double tier (half height), either in banks one row deep or in double rows (back to back).

STANDARD SIZES OF PENCO STEEL LOCKERS

(Width x depth x height, in.)

Single tier	Double tier
*12x12x60	*12x12x36
*12x15x60	*12x15x36
*15x15x60	12x12x42

*12x15x72	
*15x15x72	
*15x18x72	
*18x18x72	
*24x24x72	

*Carried in stock for immediate shipment.

Sizes other than those listed above will be made to order. Write for prices.

50U2

Sides and backs are made of No. 24 gauge steel, or when specified, of expanded metal.

Tops, bottoms and shelves are made of No. 24 gauge steel, reinforced on all edges, with ventilating louvres as illustrated, or with expanded metal.

Equipped with top shelf, gravity latch locking device and master-keyed cylinder lock.

Wall hooks supplied in single tier lockers (full height) and double tier (half height).

All lockers are supplied with 6-in. legs of 1x1x1/8-in. steel angle. Adjustable shoes permit leveling on uneven floors.

All Penco Lockers are accurately punched for quick assembly. Finish is olive green baked enamel; special finish at additional cost.

Penco Steel Cabinets

Several types—two-door, single door, desk, counter high, and wardrobe.

Standard finishes—olive green, walnut and mahogany—baked on.

No. 201

No. 200

No. 202

Penco cabinets are unusually serviceable and an ornament as well. They embody every feature of the well-known Penco locker line.

Penco Ceilings

A pattern for every purpose.

Experienced designers will submit sketches and suggestions for most practical treatment.

Penco ceiling is rigid, clear stamped and square sheared. Contracts for Penco installation—thermalizing and final decoration, carry assurance of complete satisfaction. Thousands of such contracts prove it.

CAPITOL MAIL CHUTE CORPORATION

TELEPHONE
STILLWELL 4-3790

21-30 44th Avenue
LONG ISLAND CITY, N. Y.

Products

Manufacture and installation of the CAPITOL MAIL CHUTE and RECEIVING BOX for Post Office collection service.

Capitol Mail Chute Corporation

The CAPITOL MAIL CHUTE CORPORATION is the development of an organization successful in its field for 24 years.

Authorization

The Capitol Mail Chute bears the approval of the Post Office Department and we are under bond in a large penal sum to strictly carry out the Post Office rules and regulations.

Features

As the result of persistent research and experimenting combined with the use of the best material, the Capitol Mailing System stands out as one of the most perfect means for safe delivery of mail to the hands of the Post Office collectors.

The panel frames, a special feature of the Capitol Mail Chute, are made of heavy extruded bronze material $\frac{3}{8}$ in. thick with $\frac{1}{4}$ -in. clear plate glass. These panels are rigid and easily opened for cleaning by the proper authorities. They are secured by locks made specially for us.

Design and Finish

The Capitol Mail Chute has been designed to combine its proven quality with the architectural refinements of today.

Special finishes of any kind, to conform with the architectural requirements, will be done at a slight additional cost, if any.

Service and Information to Architect

We shall be pleased to furnish to architects while plans are in progress any information necessary as to location of chutes, number of chutes, cubic capacity of receiving box.

Capitol Receiving Mail Box
Model 310

Model C
Capitol Mail
Chute

Specifications for Furnishing and Installing Capitol Mailing Systems

Note: Rough openings in the floor and patching are not part of the mail chute contract and are left for us by others. Architect should make provisions for these items in other trades.

Furnish and install where shown on the drawings, and as hereinafter specified, the Capitol Mailing System as manufactured by the CAPITOL MAIL CHUTE CORPORATION, 21-30 44th Avenue, Long Island City, New York, N. Y.

Preparatory Work

This contractor shall prepare the building to receive the mail chute equipment by furnishing and erecting (.....) frame of 2x2x $\frac{1}{4}$ -in. steel angles, securely fastened, in the rough openings provided.

The frames shall extend from the top of the mail box in the (first) story to a point 4 ft. 9 in. above the finished floor in the (top) story. At this point the angles shall be neatly mitered and returned across the top. The frame shall be left flush and plumb throughout and sufficiently rigid to properly support the mail chute. Frame shall be finished with two coats of lead and oil, dead black (or as directed).

Erection

Erect on this steel frame the Capitol Mailing System, consisting of ... Model C Mail Chute and No. 310 Standard U. S. Mail Box. The mail chute shall be ade-

quately supported by and fastened to the angle frame and shall be properly connected with the mail box. Chute shall extend from the top of box through ... floors and to a point 4 ft. 8 in. above the finished floor of the (top) story where it shall be suitably joined to the angle frame. Openings for mail shall be provided in each story.

Mail Chute

Mail chute shall be manufactured of No. 20 U. S. gauge, cold rolled steel, with removable panels of plate glass, set in bronze frames and secured in place by special locks with keys in the hands of Post Office authorities.

Mail Box

Mail box shall be CAPITOL MAIL CHUTE CORPORATION design No. 310, size, constructed of heavy sheet bronze, door and frame of cast bronze and mouldings of extruded bronze. Finish of channels and neck pieces and cast iron subbases in rustless black enamel, with fittings in bronze. All bronze surfaces shall be finished slightly oxidized, or statuary bronze color and lacquered as directed.

Conclusion

The entire work to be done to the satisfaction and acceptance of the architect, in strict accordance with the regulation of the Post Office Department.

FACTORY
ROCHESTER, N. Y.

Copyright 1930 by CUTLER MAIL CHUTE COMPANY

Product

The manufacture and installation of the CUTLER MAIL CHUTE.

Cutler Achievement

The Cutler brothers invented and patented the modern method of mailing letters from the upper stories of buildings in 1883. In 1884 four Cutler Mail Chutes were installed; at the present time there are few important high buildings in the United States which are not equipped with Cutler Mail Chutes. In addition they are in use in many foreign countries.

Cutler Quality

The name "Cutler" stands for the highest quality of design, workmanship and service.

The design is simple, substantial and elegant, and has a refined architectural and artistic character which is appreciated and much commended by architects.

The workmanship is the highest of its class attainable. The Cutler factory at Rochester, N. Y., is designed, built and equipped exclusively for the manufacture of the company's *one product—The Cutler Mail Chute.*

A complete organization and an experience of 47 years permit the maintenance of the Cutler quality of work and prompt and satisfactory execution and completion of contracts.

U. S. Post Office Requirements

When installed in connection with the U. S. Free Collection Service, this work is subject to the Regulations of the Post Office Department. Among the rules most affecting architects are the following:

Mail box should be placed as near the main entrance of building as possible, preferably within 50 ft.; not to exceed 100 ft. under any conditions. Mail chute must run in a vertical line through a public hall, or premises visible and freely accessible to the public and post office authorities. It must not be placed behind a partition or elevator screen.

Cutler Mail Chute

Standard—The Cutler Mail Chute in its standard form, known as Model F, is substantial, simple, practical. Its interior, under government lock, is quickly and easily accessible to authorized persons, as the front is removable in convenient sections.

The removal and particularly the replacement of the fronts is simple; by turning the official key in any one of the locks, the two adjoining panels are released and either or both of them can be removed and replaced as desired.

Twin Chute Equipment—For buildings where large quantities of mail originate, two or more mail chutes are provided, usually installed in pairs. By opening the chutes on alternate floors, danger of overcrowding is avoided, and in case of need one chute can be cleared, cleaned, or repaired, while the service is maintained by the other without interruption.

Special details on request.

Standard Finish—Steel chute channels (sides and back of chute) and sub-bases in dead black baked enamel; caps, duplex electrobronze plated; bases, mailing pockets and frames of glass fronts of bronze, slightly oxidized or statuary bronze color.

Bronze Finish—Model F is also made with all exposed parts of bronze. In this construction the sides of the chute channels are covered with sheet bronze. It is not unusual to use this finish in the first story, combined with the standard finish in the upper stories.

Mail Boxes—The mail box furnished with the standard finish is, for buildings of moderate size, the No. 4165 made of heavy cold rolled steel, duplex electrobronze plated, with mouldings, where the most wear comes, of bronze. Also furnished in bronze throughout.

Design 4038, illustrated, is one of a series intended for use in connection with the modernistic style.

Stock boxes are recommended where it is necessary to have a low figure. Special and semi-special designs are also furnished. In the semi-special designs stock models and patterns are used in combination with new details as may be necessary to complete a consistent design.

Installation

The CUTLER MAIL CHUTE COMPANY erects its work complete, including steel angle supports, but *not* including rough openings through floors and the repairing and finishing of plaster and other materials coming in contact with the work.

U. S. Mail Box, Design No. 4038

Model F
Full story

The Post Office Department requires from us scrupulous observance of its regulations with regard to the installation and use of mail chutes in buildings, and we are under bond in a large penal sum to insure such observance.

Specifications

Note: Rough openings through floors are not included in the mail chute contract, and are otherwise provided for together with the items of general cutting and patching and repairing of plaster.

When concrete construction is used, openings should be formed by setting centers or curb boxes (7x12 in.) when concrete is poured.

(1) Mail Chute Equipment—Mail Chute where indicated on drawings shall be the Cutler Mail Chute Equipment. To be manufactured and installed complete, including supports, by the CUTLER MAIL CHUTE COMPANY, Rochester, N. Y., as follows:

(2) Supporting frame to be of 2x2-in. steel angles, securely fastened, extending from the floor or top of the mail box in the first (ground) story to a point 4 ft. 8 in. above the finished floor in the (top) story, and there finished by neatly mitering and returning the angle across the top. This frame to be plumb and flush in all stories, and sufficiently rigid to form a suitable support for the Mail Chute. Finish to be 2 coats of dead black or color to match elevator screen, as directed.

(3) Furnish and erect on the steel frame described above (one) Cutler Mail Chute,

Detail of Model F Type
Unlocked, panels released, and lower panel removed

Model F, and (one) (special) U. S. Mail Box. The Mail Box to be located in the first (ground) story, and the Mail Chute, properly connected with and extending from the top of the Mail Box through stories and 4 ft. 7 in. into the (top) story, with openings for mail in each of these stories.

(4) Mail Chute to be constructed of No. 20 U. S. gauge cold rolled steel formed in channels with removable panels of rolled glass, set in frames of bronze and secured in place by the standard Cutler U. S. Mail Chute locks with keys in the hands of the Post Office authorities.

(5) Mail Box to be of design No. 4165, 37x21½x11¼ in. over all, electrobronze plated, with mouldings of bronze. Finish of Mail Chute in all stories to be standard—steel chute channels and subbases in dead black baked enamel with other fittings in bronze. All bronze surfaces to be finished slightly oxidized and lacquered.

(6) Work to be done to the satisfaction and acceptance of the architects,; in strict accordance with the regulations of the Post Office Department, and installed with the approval of the Postmaster of Any and all defects in workmanship or material developing within 1 year from date of completion, to be made good without charge.

Note: If bronze finish is desired in the first story, substitute the following paragraph for paragraph (5) above:

(5A) Mail Box to be of bronze from design No. 4165, Exposed parts of Mail Chute and supporting angles in first story to be of bronze; construction and finish of Mail Chute in upper stories to be standard—steel chute channels and subbases in dull black enamel with fittings in bronze. All bronze surfaces to be finished slightly oxidized or statuary bronze color and lacquered.

General Installation Details of Cutler Mail Chute

FRANCIS KEIL & SON, INC.

Manufacturers of Apartment House Mail Boxes

401-425 East 163rd Street
NEW YORK, N. Y.

For Keil Burglarproof Cylinder Locks, see Manufacturers' Index

Description

"Keilson" Government Approved Apartment House Mail Boxes are neat and artistic in design and are made of heavy wrought brass. They insure safety of the mail and are convenient for the carrier.

They are built in accordance with United States Post Office Department Order No. 3979.

"Keilson" Boxes have been also improved by increased receptacle space, and are entirely free from all obstructions in the way of mechanical construction, yet retaining economy of wall space.

Specification Details

Made of heavy wrought brass with steel receptacles. Each box is (over all) 17½ in. high and 3½ in. wide (end box 4½ in. wide). Receives mail up to 15x3¼ in. Visitor's card slot, 2¼ in. Tenant locks have 3 tumblers and have 60 changes.

Master lock applied with special patent machine screws for the convenience of the post office authorities in replacing damaged locks without defacing or marring either the master door or name plate.

Surface of boxes entirely flush and without any screws or fastenings showing to mar their appearance.

Finishes

Finished in "Sprayed Brass" Finish only, except to order at extra charge, as follows: Sprayed Antique Copper; Sprayed Verde Antique; Sprayed Statuary Bronze; Sprayed Colonial Iron. Also other standard finishes imitated by spraying process.

These finishes are best preserved by simply washing the surface with soap and water.

Telephone Equipment to Fit "Keilson" Boxes

Manufacturers of telephone units will furnish their telephone equipment to fit our standardized "Keilson" Combined Receptacles and Frames.

These match up with "Keilson" Letter Boxes and may be placed either alongside or amongst the letter box groups that are placed in single rows or may be placed entirely separate therefrom.

When used in combination with single row letter box groups, all sizes specified there can be used together, however, with the sizes specified below to accommodate the selected "Receptacle and Frame" for the telephone unit.

"Keilson" Combined Receptacle and Frame Sizes to Accommodate Telephone Units

The size required must be determined by the make of telephone unit and the number of push buttons required. Frames are made of wrought brass, receptacles of steel (see Finishes).

When telephone units (or extra button units) are used in combination with letter boxes mounted in double rows, we give no plans for letter box groupings, nor mention sizes for wall cut-outs, as the telephone or the push button units effect the general grouping of double rows of letter boxes and as there are so many possible layouts for telephone units, extra push button units and the letter boxes, we respectfully ask prospective purchasers to submit wall space available and the plan of desired layout (if any decided upon), whereupon we shall furnish the wall cut-out size if requested and a plan if desired.

DIMENSIONS OF "KEILSON" COMBINED RECEPTACLE AND FRAMES

Outside sizes of "Keilson" Receptacles and Frames, in.	Size of telephone plates required to fit "Keilson" Receptacles and Frames. Being equivalent to 1, 2, 3 and 4 single "Keilson" Letter Box Units as specified, in.	Add to width of wall cut-out when placed alongside of "Keilson" Single Row Grouped Boxes	Add to width of wall cut-out when placed between (2) groups of "Keilson" Single Row Boxes	Make wall cut-out when used entirely separate from the letter boxes
No. 1 17½ high x 5½ wide	15½ high x 3 wide	5½ in.	5½ in.	4 in.
No. 2 17½ high x 9 wide	15½ high x 7 wide	9 in.	9 in.	7½ in.
No. 3 17½ high x 12½ wide	15½ high x 10 wide	12½ in.	12½ in.	11 in.
No. 4 17½ high x 16 wide	15½ high x 14 wide	16 in.	16 in.	14½ in.

Thickness of metal required for all .060. Templates for screwholes furnished.
Push button vertical plates also furnished for use with these boxes.

Information

"Keilson" Receptacles and Frames are also utilized for push button and panel layouts for use in vestibules, and these can also be made in combination with loud speaker to order.

"Keilson" Receptacles and Frames overlap the specified wall openings (1) inch all around.

"Keilson" Receptacles and Frames are fastened to the wall in the same manner as "Keilson" Letter Boxes.

"Keilson" Receptacles and Frames are made in the same finishes as "Keilson" Letter Boxes. Telephone Units may be sent us for matching up the finishes of the letter boxes.

All packed in double cartons to assure safe delivery to distant points.

UNITED MAIL BOXES

Manufactured by

UNITED METAL BOX CO., INC.

473-491 President Street, BROOKLYN, N. Y.

Product

UNITED MAIL BOXES.

For our page on Bathroom Cabinets, see Manufacturers' Index.

United Mail Boxes

Designed to meet all requirements of the Post Office Department Order No. 3979, issued March 9, 1926. Standard over-all height 16½ in. Made in gangs of 3, 4, 5, 6, 7 and 8 units, each unit accommodating mail for one tenant. Each gang fitted with post office lock, furnished by United States Post Office Department, each unit with tenant lock.

United Mail Box units are built as one box, not assembled. Casing is of steel with rustproof coating of lead and zinc. Fronts are heavy gauge brass designed in panel effect. All hinges and screws concealed. Upper master (postman's) door is counterbalanced and acts as sorting shelf for postman when opened. Lower (tenant's) door opens upward to a stationary position leaving both hands free. Opening doors can not cover tenant's name plate.

United Boxes are made with or without speaking tube mouthpiece and push buttons. Boxes with mouthpiece and push buttons have buttons on removable plate to allow easy access to wiring.

See table for sizes and gang arrangements.

Service

It is our desire to co-operate with the architect and contractor in every way and to have them utilize the experience and facilities of our organization in dealing with any problem involving the selection and installation of mail chutes and equipment.

Our engineers are at the service of the building trade and are ready at all times to assist in the solution of individual problems or to furnish information regarding costs of installation, etc. All estimates on mail chutes and mail boxes are written to cover our standard finish unless otherwise specified.

Write to us for any information, regarding cost of installation, or your own particular problems.

Improved Construction of U. S. Mail Chutes

The construction of the interior of United States Mail Chutes is such that there can be no impediment to its successful operation.

The process whereby the channels are practically embedded in the panel frame makes the interior of the chute equivalent to one-piece construction in effectiveness. This construction eliminates crevices and precludes blockage in the chute.

The panels are composed of special bronze moulding and $\frac{1}{4}$ -in. clear glass which permits observation of the passage of the mail. These panels are absolutely pryproof and are secured by special locks made for us by Corbin.

The simplicity with which these glass panels can be opened by authorized persons for cleaning is clearly shown at the right.

Officially Approved by the United States Post Office Department

UNITED STATES MAIL CHUTE CORPORATION equipment has been officially approved by the United States Post Office Department.

United States Postal Service Regulations call for strict observance of their requirements. The form of contract we use is based on these requirements and governs the installation of the UNITED STATES MAIL CHUTE CORPORATION's mail chutes and boxes.

Single and Twin Chutes

In buildings of moderate size our Model A Single Chute will often suffice but in large buildings where a heavy deposit of mail makes the single chute inadequate, our twin chute, with openings for mail on alternate floors, has the necessary capacity and eliminates overcrowding or congestion of either chute.

Stock Designs and Special Finishes

While the UNITED STATES MAIL CHUTE CORPORATION has given every care to assure the practical utility of its device, the ornamental aspects have also received due consideration. Simplicity of line is stressed throughout, achieving a harmonious dignity in accordance with conventional and modern architectural motifs. In addition to stock designs and patterns, U. S. Mail Chutes and equipment can be supplied in any finish the architect or owner may desire in order to conform with the decorative scheme of the building in which the installation is to be made.

Specifications

Work Included—Equipment of mail chutes shall be of UNITED STATES MAIL CHUTE CORPORATION'S manufacture and shall include (one United States Mail Box No. in). This equipment shall be located where indicated on plans and installed complete by the UNITED STATES MAIL CHUTE CORPORATION, New York, N. Y.

Note: All in accordance with the requirements of Part B, New York Building Congress Standard Specifications for Mail Chutes, Items 5 to 8, inclusive, quoted verbatim as follows:

(5) **Preparatory Work**—Rough openings, in floor construction and suspended ceilings, or chases in walls or partitions necessary for the proper installation of mail chutes and mail boxes will be provided under other divisions.

After the installation by this Contractor, of thimbles or sleeves, angle frames, mail chutes and mail boxes, the contractors for other divisions will finish their work neatly against or around the work furnished and installed under this contract. This Contractor, however, shall assist in the location and plumbing of openings and chases.

(6) **Construction**—Where Standard Mail Chutes are called for under Part A, this Contractor shall furnish and install:

(a) Steel thimbles extending down from finished floor, through the construction, to finished ceiling.

(b) A frame, consisting of 2x2 in. steel angles, starting from the top of the mail box, located in the first (ground) story and extending through each story to be served, to a point 4 ft. 8 in. above the floor of the last story served. At this point the frame shall be finished by mitering and returning the angle across the top. This frame shall be erected true and plumb throughout its entire height in the relation to structural framing, indicated on the architect's drawings and be firmly and rigidly secured in place.

The floor sleeves and angle frames shall be installed before plastering.

(c) A chute, consisting of No. 20 gauge cold rolled steel, forming channel sections, extending from the floors to ceilings, the front of which shall consist of special mail chute glass panels set in bronze frames. These panels shall be secured in place by locks acceptable to the United States Post Office authorities. The chute shall be finished, at the floor with a neatly designed die-cast sub-base and base and, at the ceiling, with a die-cast ceiling collar.

(d) A mail box, of the size, design, material and finish specified under Part A. Where the type of box is not given under Part A, the estimate shall be based on furnishing and installing a mail box of stock design, subject to the architect's selection, of size sufficient to accommodate mail matter of the building; the box shall be constructed of sheet steel and cast iron, electro bronze plated, with mouldings of drawn bronze.

(*Note:* The UNITED STATES MAIL CHUTE CORPORATION'S stock design boxes are constructed of heavy gauge solid sheet bronze and cast bronze, with mouldings of extruded bronze.)

(7) **Finish**—Unless otherwise specified under Part A, the standard for the various parts of the installation shall be as follows:

MAIL CHUTE FRAME—Two coats of lead and oil finished flat black, unless otherwise directed by the architect.

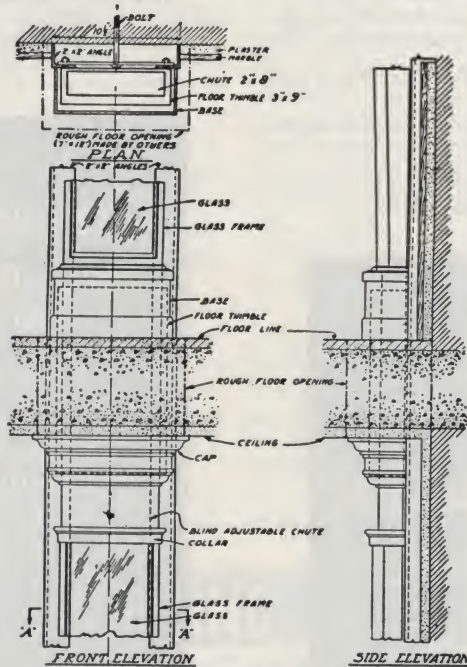

MAIL CHUTE CHANNELS AND SUB-BASE—Flat black, baked enamel.

BASE AND CEILING COLLAR—Electro bronze plated.

(*Note:* Base and ceiling collar of UNITED STATES MAIL CHUTE CORPORATION equipment is cast bronze.)

MAIL BOX AND ALL BRONZE FITTINGS—Statuary bronze, lacquered.

(8) **Post Office Requirements**—This Contractor, as part of his contract, agrees to execute all work, in connection with the construction and installation of the mail chute, strictly in accordance with the regulations of the Post Office Department. Before acceptance of the work by the owner this Contractor shall obtain the approval of the local Post Master or other Post Office Department official having jurisdiction.

Installation Details of U. S. Mail Chute

Standard Mail Box No. 12

Made of heavy gauge sheet bronze, with door, frame and mouldings of cast bronze, in slightly oxidized or statuary bronze finish

Special Standard Mail Box No. 86

One-piece construction, with front of cast bronze and body of 14 U. S. gauge sheet bronze

Standard Mail Box No. 15

Constructed of heavy gauge sheet bronze, with door, frame and mouldings of cast bronze, in slightly oxidized or statuary bronze finish. Designed to conform with the modernistic motif in architecture

ADVANCE DIRECTORY COMPANY

Manufacturers of Building Directories and Bulletin Boards

303 Fourth Avenue, NEW YORK, N. Y.

Products

BUILDING DIRECTORIES (Strip or Loose Letter Type); CHANGEABLE BULLETIN BOARDS, ANNOUNCEMENT BOARDS, CORK BULLETIN BOARDS, MEMORIAM BOARDS, IN-AND-OUT and STATISTICAL BOARDS, GOLF HANDICAP BOARDS.

Building Directories (Strip Type)

Advance Building Directories are modern in design, compact, practical and ornamental.

Frames—Wood, iron or bronze (drawn, extruded or cast); stock or special designs created to fit any requirements. Blue print of mouldings on request.

Sections (Glazed Panels)—Cold rolled steel fitted with bevel plate glass and lock.

Removable separately from face of frame—names remain on steel backboard exposed to view permitting convenient and rapid insertions, removals or respacing of name strips.

Name Strips—Lettering embossed by machine process assuring perfect spacing and alignment and uniformity.

Service or Sale—We maintain directories on contract or sell same outright. New name strips furnished promptly.

Bulletin Boards—Changeable Letter Type for Indoor or Outdoor Use

Used in hotels, office buildings, public buildings, churches, banks, clubs, schools, colleges, etc., for sales charts, announcements, hymn boards, etc.

Frames—Wide variety of designs and materials, glazed or unglazed as desired.

Grooved Boards—Boards are made of kiln dried wood, properly reinforced, covered with best quality cloth of standard or special colors.

100-Name Directory

Letters—"Advance" die-cast aluminum letters, with letter and invisible prongs in one piece.

Easy to insert, shift or remove. Artistically designed, clean-cut and legible. The faces of the letters are flat, with a baked semi-flat white finish and black beveled edges which throw the letters into strong relief.

Sizes $\frac{1}{4}$ to $2\frac{1}{2}$ in. in height. Can be had in colors if desired. Guaranteed against breakage and discoloration.

Advance Die-cast Aluminum Letter

Sizes—Strip type directories consist of any number of sections, as described above, fitted into an outer frame. For computing sizes of frames for any given number of names refer to chart below.

SIZES AND NAME CAPACITIES OF ADVANCE STRIP TYPE DIRECTORIES

Wide Scope of Adaptability

Building Directories and Floor Directories—For office and loft buildings, banks, hotels, clubs and fraternal organizations, department stores, hospitals, schools and colleges, business departments, and public buildings and places where alphabetical or group listings are required.

Bulletin and Announcement Boards—For hotels, churches, railroad and steamship schedules, theater ticket agencies, rosters, menus, programmes, etc.

Statistical Boards—Sales record tabulations, factory production records, hospital and institutional census records, fire department calls, competitive records, stock quotations, etc.

Club Boards—Rosters, golf handicap boards, in-and-out, changeable letter bulletin boards, and cork bulletins for thumbtack notices.

Building Directories (Akina Type Strip Directories)

This new and improved directory has been developed by our organization and is the result of our many years of manufacturing directory boards.

Patented October 20, 1925, No. 1557542 and February 16, 1926, No. 1573126.

Advantages—Construction so simple no supervision required for making changes. In making changes, it is only necessary to remove the doors with a key, leaving all name strips in place, so that operator is always working from the front, making alphabetical mistakes improbable. This method of making changes is a distinct advance over any other system, since it permits changes to be made with one operation, allowing the directory board to be in full use while changes are being made. Any door may be removed and cleaned without disturbing the names. Changes are supplied promptly at nominal cost.

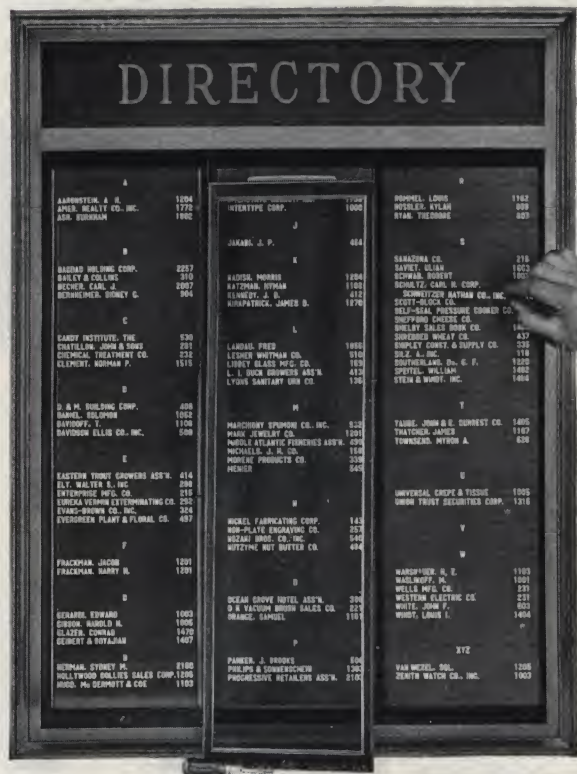

Frame Designs and Finishes—Frames for the various types of directory and bulletin boards are furnished either in approved stock designs or in accordance with the architect's specifications. Special designs are created when desired. They can be had in bronze, wood or iron in any finish required. We supply our systems without frames if so desired.

Service—Directories are sold outright and service maintained, or furnished on rental basis.

AKINS PRODUCTS, INC.

118

$\frac{3}{8}$ -in. Strip, $\frac{1}{4}$ -in. Letters for Akina Type Strip Directory, Actual Size Shown
Also made $\frac{1}{2}$ in. wide with $\frac{3}{8}$ -in. letters and $\frac{1}{8}$ in. wide with $\frac{1}{16}$ -in. letters

Akina Type Strip Directory
Stock design No. 226, bronze frame

Cast Bronze Directory, Style No. 306
36 in. wide x 43 in. high
Capacity, 265 names

Specifications—(1) Frame—Frame to be constructed of bronze (steel, iron or wood), workmanship and design to meet approval of architect. Title of directory shall be in bronze.

(2) Fillers—Any door shall be removable, allowing easy access to change name strips, without disturbing balance of directory. Name strips to remain in directory while changes are being made. Name strips shall be held in place by a steel backboard, covered by locked doors of cold rolled steel finished in baked enamel (or bronze). Doors to be glazed with beveled plate glass.

(3) Name Strips—Name strips to be of flexible fibre board, covered with dull black paper. Names to be made with white embossed letters, machine spaced, alignment to be perfect and all lettering uniform.

(4) Service—Must be accurate and prompt. Directory to be purchased outright (furnished on rental basis).

Style 376

Style 377

Elevator Directories

Style No. 376—Listing the names of tenants in the smaller buildings.

Style No. 377—For inspection card and listing profession or business of tenant and regulation card in one frame, combining the requirements in the elevator of a modern office building. Convenient to locate tenants on various floors and a service greatly appreciated.

Changeable Letter Type Directory Installed in the Municipal Building, New York, N. Y.

Special design cast bronze frame, using broadcloth covered grooved backboard and Akina's letter type B

Greeley Changeable Letter Directories

This is the original changeable letter system. Directories in use for over 40 years are still giving excellent service, testifying to the durability of the system.

In making changes, the entire equipment is under complete control of the owner—no outside assistance is needed.

Backboard—Made solid or in interchangeable strips, each strip designed to hold a name or a line of reading matter, and the whole grooved horizontally and covered with durable broadcloth. The wood used is well seasoned, kiln-dried and free from knots, ribbed and reinforced in an improved manner to prevent warping.

Broadcloth—Of fine durable quality, all wool.

Colors—Black, blue, green or special colors.

Letters—Type "A"—Made of an ivory white durable solid plastic material. Have moulded prongs to fit into the grooves of the backboard and are removable and replaceable with perfect ease. The prongs are so fixed as to assure perfect alignment.

Sizes— $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, 1 and $1\frac{1}{2}$ in.

Type "B"—Are convex faced and stamped in one piece (including tongues) from half-hard brass and covered with a special ivory white enamel, guaranteed against discoloration, cracking or chipping. The letters are set and held in place by tongues top and bottom, and can be set in an upright position only and will align perfectly.

Sizes— $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$, 1 and $1\frac{1}{2}$ in.

Type A

Type B

Continued on next page

Changeable Letter and Strip Backboard

For use in small buildings. Strips are removable. Names are made with loose letters which are inserted on strip. The strips can be removed, inserted or transposed without disturbing or removing adjacent strips.

A tool, as shown in illustration, may be used or removal can be made by hand.

Every strip holds in place individually and slides up or down as required.

Cast Bronze Floor Directional Arrows

Made of cast bronze in stock designs or from architect's details. Easily attached to any wall. A sign that will be understood. Also made in glass illuminated.

Solid Bronze Letters

Made in a number of stock designs or architect's specifications accurately followed. Sketch to scale or space on receipt of accurate measurements.

Reflectolite Signs—Wall and Hanging Types

An illuminated sign for all purposes where an effective sign is required for hotels, clubs, banks, theatres, office buildings, public buildings and stores.

Type No. 1. A plate glass with etched letters. The source of illumination is entirely hidden. The light enters the plate through the edge. The plate appears dead, except where the etching occurs, giving a surprisingly beautiful and original effect.

Type No. 2. Raised opalite letters on a ground of deep rich bronze.

No. 420

Single or double face with flange to attach to wall or casing. Made with plates 14 and 26 in. long. 4 to 8 in. high

No. 424

Hanging. Single or double face. Made with plates 14 and 26 in. long. 4 to 8 in. high

No. 425

Single face. Made with plates 14, 26, 38, 50, 62 and 74 in. long. 4 to 8 in. high

ESTABLISHED 1913

Products

BUILDING DIRECTORIES for Lobby or Floors: CLARK LIBERTY (INTERCHANGEABLE LETTER) and CLARK EMBOSSED STRIP.

Also Rosters, Bulletin and Announcement Boards, Desk and Teller Name Plates, and Cork Tack Boards.

Clark Directories

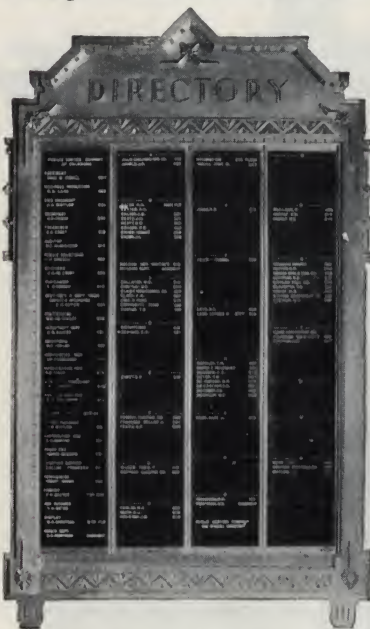

Clark Liberty Directory (Interchangeable Letter)—Little or no up-keep cost; immediate service to tenant; letters and covered strips can be re-used many times; practically same wall space required as for gummed-strip using same size letter. Letters made of best white celluloid under Clark patent.

Embossed Strip Directories—Also supplied and a service on strips given. Service costs approximately 15% of customary rental. We do not rent directories, but save owner about 85% of such rental charge. Strips fit easily into groove and are held in position with felt covered back.

Styles and Sizes

All sizes, styles and finishes supplied—ornamental iron, plain or ornamental extruded bronze, wood filled bronze, and wood in either oak, walnut, mahogany or ebony finish.

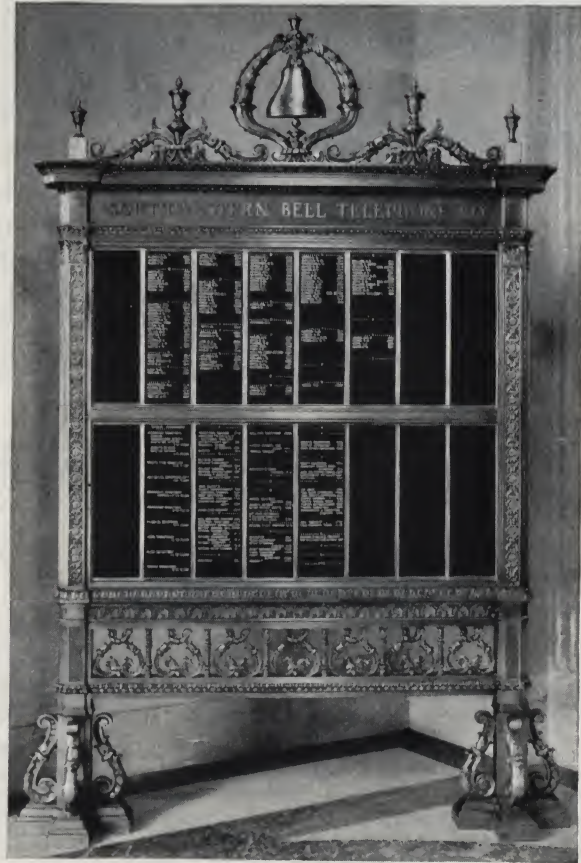

Standard width

4-section Special Clark Liberty Directory

3-section Special Clark Liberty Directory

16-section Clark Liberty Directory, Special Bronze Frame

of sections: for changeable strip (embossed strip), $7\frac{1}{2}$ in.; for Clark Liberty (interchangeable letter) $7\frac{1}{2}$ in. with $\frac{1}{4}$ -in. letters and 12 in. with $\frac{3}{8}$ -in. letters. Sections also made 15 in. wide for $\frac{1}{2}$ -in. letters.

Any convenient heights can be made; standard sizes are given on following page.

Estimates

For all ordinary buildings two names to the room will be the approximate capacity of directory required. In the case of special buildings, more or less, according to purpose of the building.

In writing for estimates, state total number of names board must hold; material; style; finish; and, particularly, available wall space, if limited.

Vertical Cross Section of Clark Liberty Directory

SPECIFICATIONS

Directory—At the place indicated on the plans or to be designated by the architects, the contractor shall install an "A" section "B" strip directory made by the R. W. CLARK MFG. Co., 4311 Ravenswood Avenue, Chicago, Illinois.

The strips shall be made for the use of "C" inch Clark interchangeable celluloid letters and shall be covered with black broadcloth.

Sections shall be glazed with beveled plate glass with frame of "D."

The directory frame shall be "E."

Legend—"A"—State number of sections of fifty strips each. (40 for 1/2-in. letters.)

"B"—Calculate at two to two-and-a-half times the number of rooms.

"C"—One-quarter, three-eighths or one-half.

"D"—"Wood," "black steel" or extruded bronze.

"E"—Oak, mahogany or ebony finish, black ornamental iron, bronze wood filled, extruded bronze, extruded ornamental bronze or cast bronze.

DAVENPORT-TAYLOR ALPHABETICAL and CHANGEABLE BUILDING DIRECTORIES for every type of building.

CLUB and STORE DIRECTORIES.

EMBOSSED and PRINTED GUMMED LABELS and SEALS, in paper, foil and metal.

Also, Key Cabinets.

For our page on Bronze Tablets, Bronze Memorial Plaques, Name Plates, Electric Directional Signs, Exit Signs, Interior Electric Signs and Cast Letters, see Manufacturers' Index.

Quality

The name Davenport-Taylor stands for the highest quality of design, workmanship and service. A complete organization and twenty years' experience assures the maintenance of the Davenport-Taylor quality of work and prompt and satisfactory completion of contracts.

Changeable Building Directories Sold Outright or Installed on the Yearly Rental Plan

These two plans afford the architect and owner the opportunity to choose the plan they want.

Directory Service

When a Davenport-Taylor Directory is received at a building it contains all the names of tenants who have already signed leases for office space. This detail is arranged by the company through the owner or renting agent. Subsequent name strips are furnished by the company as needed, or the owner can purchase supplies and letter the names. Lettered strips are shipped within 24 hours after receipt of order.

Construction

Full size detail will be furnished on request. Frames are cast bronze, extruded bronze, iron, steel, metal covered wood or wood in any finish. Heading may be in cast letters or white letters on a black card. Removable sections or units to hold the names are provided in numbers sufficient to accommodate the names required. Units or sections are fitted with plain or beveled plate glass to protect the names. Names are lettered with our die-cut white paper letters on black cards which slide up or down in the holder to permit insertion of new strips in alphabetical order.

Cast Bronze, Design No. 501, Capacity 250 Names, Installed in Richmond Trust Building, Richmond, Va.
STARRETT & VAN VLECK, Architects, New York, N. Y.

Special Designs

We are equipped to complete special designs requiring the greatest skill. Our workmen are artists in the work.

Panels Only

We also supply our system for frames made by others according to our details.

STEEL FRAME AND UNITS, "D & T" DIRECTORIES

Number of names	Number of units	Size of units, in.	Sight opening of frame, in.	Outside size stock frames, in.
50	2	7 1/2 x 26 3/8	14 7/8 x 26	18 1/2 x 34 1/2
100	3	7 1/2 x 26 3/8	22 3/8 x 26	25 1/2 x 34 1/2
150	4	7 1/2 x 32 1/2	22 3/8 x 32 1/2	25 1/2 x 41
	4	7 1/2 x 26 3/8	29 7/8 x 26	33 x 34 1/2

	6	7 1/2 x 26 3/8	44 1/8 x 26	48 x 34
300	6	7 1/2 x 32 1/2	44 1/8 x 32 1/2	48 x 41
	7	7 1/2 x 26 3/8	52 3/8 x 26	55 1/2 x 34 1/2
400	7	7 1/2 x 32 1/2	52 3/8 x 32 1/2	55 1/2 x 41
	9	7 1/2 x 26 3/8	67 3/8 x 26	70 1/2 x 34 1/2
500	8	7 1/2 x 32 1/2	59 1/8 x 32 1/2	63 x 41

To Figure Capacity and Size—The capacity should be figured on a basis of at least two names to each individual office to insure against future renting arrangements. Reference to the detailed schedule shows the approximate over-all size, varying with the design. If no wall space is available, single or double face directories or standards should be provided.

SELLING AGENTS IN PRINCIPAL CITIES

Products

LIBERTY BUILDING DIRECTORIES (Changeable Embossed Strip) and LIBERTY BULLETIN BOARDS (changeable Noglare Celluloid Letters).

Also manufacturers of Bronze Tablets and Signs (Send for Catalogue G), Interchangeable Letter Signs, Hotel Bulletin Boards, Statistical Boards, Cork Bulletin Boards, Edgelow Electric Signs, Bronze Signs, "In and Out" Boards for clubs, Golf Club Handicap Boards, Wood and Metal Frames, Name Plates, etc.

Liberty Directory Boards for the Better Type of Building

Liberty Directory Boards are sold outright. They provide an owned board which will represent an actual saving of from 25% to 50% over the rented board. Strips, both blank and embossed, are furnished without charge on installation. Additional name strips cost only 15 cents each. Thus the building management pays only for what it needs and uses.

Custom Built Frames—Liberty Boards are made with special heavy gauge drawn bronze or cast bronze frames, as well as bronze frames over wood core or solid wood. Each frame is custom built for its respective installation. Frames mitered accurately and strongly reinforced from inside. No corner pieces employed. Panels are fitted with heavy beveled plate glass.

How the Welded Steel Door, with Beveled Plate Glass, Opens

How the Embossed Changeable Strip Slips Quickly and Easily Into Place

HOW TO FIGURE THE CAPACITY OF LIBERTY STRIP DIRECTORIES

Size of directory units, in.	Maximum capacity using $\frac{3}{8}$ -in. Liberty strips		Maximum capacity using $\frac{1}{2}$ -in. Liberty strips	
	Blanks	*Names	Blanks	*Names
$7\frac{1}{2} \times 26$	60	40	40	25
$7\frac{1}{2} \times 32$	80	60	50	35

*Name capacity is less than "blank capacity" due to necessary spacing and extra line names.

Note: In order to allow for proper elasticity, it is always better to figure two names to each office; because, while one entire floor may be taken by a firm which will require but one name strip on the directory, a single office may carry as many as eight or ten names. Then, too, it is well to figure enough room so as to make allowances for the future, when floors may be cut up into offices.

Liberty Changeable Embossed Strip Directory—Made for Liberty Bank, Buffalo, N. Y.

Each of the 10 sections is $7\frac{1}{2} \times 26$ in. and holds 60 $7\frac{1}{2} \times \frac{3}{8}$ -in. strips

No. 3 1/2 S, size 14×22 in. over all. Wood frame in oak or mahogany finish. Capacity 20 $10 \times \frac{3}{8}$ -in. strips. Price \$25.00.
No. 3S, size 14×34 in. Capacity 40 $10 \times \frac{3}{8}$ -in. strips. Price \$35.00

No. B3 1/2 S, size 13×23 in. over all. Bronze kalamein frame. Capacity 20 $10 \times \frac{3}{8}$ -in. strips. Price \$65.00.
No. B3S, size 13×34 in. Capacity 40 $10 \times \frac{3}{8}$ -in. strips. Price \$75.00

Liberty Changeable Embossed Strip Directories
Installations from coast to coast and in many foreign countries. Write us for installations in your city or nearby

Note: Liberty equipment, however, may be purchased separately when the directory frame is included in the bronze contract. In this case, drawings should be sent to us for our approval, as dimensions must fit our standard sections.

Frame should be shipped to our factory where installation of our equipment will be made. It is then sent direct to the building ready for erection.

Legibility and Appearance—The changeable name strips are made of special imported dull fibre and are *reversible*—an exclusive feature.

Liberty strips, which are made in two standard sizes, $\frac{3}{8}$ and $\frac{1}{2}$ in., are held in channels in the back boards so they cannot slip. The special spring back board with its channels, and action of door when closed, cause all name strips to flatten out evenly against the glass.

The lettering on the name strips is done by machine embossing. This produces a beautiful, perfectly aligned and clean cut result.

Service—Return mail service on name strip is guaranteed. This is similar to the system adopted for firehouse assignments where service is imperative. Hundreds of managers of important buildings are glad to recommend this service.

When Making Inquiries

Give number of offices to be served (note that two lines should be allowed for each office); kind of frame: whether solid drawn bronze, kalamein bronze, or wood (if wood, give kind and finish); maximum dimensions of space available.

Building Directories

Bronze Frames—3 styles, (a) drawn bronze over invisible wood core—see sections on following page, (b) extra heavy extruded bronze, without wood core, (c) ornamental cast bronze. Finishes: Light natural brushed bronze or dark oxidized bronze.

Wood Frames—Finished mahogany, walnut, oak or ebony.

Changeable Letter Style—(Shown below) permits changes by owner without outside assistance.

Changeable Name Strip Style—(Shown following page) uses standard name strips—either $7\frac{1}{2}'' \times \frac{3}{8}''$ or $10'' \times \frac{5}{8}''$. Fast service. Low cost.

Ornamental Bronze Directories

Architect's own design or Matthews. Changeable letter directories made any size. Name strip directories should accommodate standard panels—see following page.

"MUNICIPAL." Standard solid cast bronze directory, $39'' \times 46''$. Either changeable letters or name strips. Changeable $\frac{1}{2}''$ letters recommended—capacity 75 names.

CHANGEABLE LETTER DIRECTORIES

No. 130 Changeable Letter Style

Bronze frame No. 50 or 51 (see following page) with No. 54 for inset hinged glass door. Illustration $28'' \times 40''$. Made any size. With wood frame Style No. 30

Flat Face Celluloid Letters

For matching up existing installations or where flat face is preferred. $\frac{1}{2}''$, $\frac{3}{4}''$, $1''$, $1\frac{1}{2}''$ and $2''$. White, red and yellow.

DeLuxe Metal Letters

White enamel face on cast aluminum. Hand-some in appearance. $\frac{1}{4}''$, $\frac{3}{8}''$, $\frac{1}{2}''$, $\frac{3}{4}''$, $1''$, $1\frac{1}{2}''$ and $2''$ sizes.

Suitable floor standards made in either bronze or wood—supplied where wall attachment is not desired

Letters have wings on back to fit in grooved background (grooves $\frac{1}{4}''$ c-c). Background is black broad-cloth. Other colors can be supplied

No. 150 Changeable Letter Weatherproof Outside Directory

Made any size. Frame section No. 53, dark oxidized bronze finish. Hinged glass door. Illustration $24'' \times 48''$ with $8\frac{1}{4}''$ cast bronze header. Header optional

"Embossed" Celluloid Letters

Beautiful contour and highlighting. Made in white, yellow, green and red. Sizes $\frac{1}{2}''$, $\frac{3}{4}''$, $1''$ and $1\frac{1}{2}''$. Sold in "fonts" arranged for average use (letters or figures). One size to a font. Fonts of 100, 200 or more.

CHANGEABLE NAME STRIP DIRECTORIES

Section No. 50

Section No. 51

Section No. 52

Section No. 53

Section No. 54

No. 180-S Directory

Made with any number of panels. See sizes below. Name strip $7\frac{1}{2} \times \frac{3}{8}$ ". Frame section No. 50 or 51 recommended. Solid bronze letters in header. Plate glass inset panels in black enameled steel frames.

DIRECTORY CAPACITIES

Directories using name strips $7\frac{1}{2} \times \frac{3}{8}$ " use standard size inset panels—either $7\frac{1}{2} \times 26$ " or $7\frac{1}{2} \times 32$ ". Approximate capacities and over-all sizes are given below. Capacities are for directories comfortably filled. Maximum capacity would average about 25% more.

Number of names	Number of $7\frac{1}{2} \times 26$ " panels	Approx. over-all sizes, in.	Number of names	Number of $7\frac{1}{2} \times 32$ " panels	Approx. over-all sizes, in.
75	2	18 x 34	125	2	18 x 40
125	3	25 $\frac{1}{2}$ x 34	195	3	25 $\frac{1}{2}$ x 40
175	4	33 x 34	265	4	33 x 40
250	5	40 $\frac{1}{2}$ x 34	335	5	40 $\frac{1}{2}$ x 40
300	6	48 x 34	405	6	48 x 40
350	7	55 $\frac{1}{2}$ x 34	475	7	55 $\frac{1}{2}$ x 40
400	8	63 x 34	545	8	63 x 40

BUILDING DIRECTORIES; BUSINESS DIRECTORIES; CHURCH DIRECTORIES; STORE DIRECTORIES; CLUB MEMBERSHIP and HANDICAP BOARDS; CHANGEABLE LETTER SIGNS and BULLETIN BOARDS; "IN" and "OUT" BOARDS; HOSPITAL REGISTER BOARDS; INTERIOR ELECTRIC DIRECTIONAL SIGNS; CHANGEABLE DESK AND GRILLE NAME PLATES; WILLSON'S GUMMED PAPER LETTERS and FIGURES; SELF-SPACING PYRALIN SELL-U-LETTERS; EMBOSSED and PRINTED LABELS and SEALS.

(A) Building Directories—Service or Sale

(A-1) Service—

THE TABLET & TICKET Co. will install its directory equipment as specified, furnish name strips as ordered, and keep the directory up to date, making name changes as ordered. The service will be installed under a five-year contract at an

agreed annual fee based upon the name capacity of the equipment. No charge is made for the equipment.

(A-2) Strip Service—In cities where our plant and branch offices are located, we render 24-hour service on strip changes, and in any other cities, service within 3 days.

(A-3) Maintenance—A staff of men visit our directories periodically to see that they are kept clean, in repair and in good working order. There is no additional charge for this service.

(A-4) Sale—THE TABLET & TICKET Co. directories may be purchased at a very reasonable cost; in this case regular Tablet & Ticket Directory service may be had at special rates.

(B) Description of Office Building Directory

(B-1) The Directory—Each directory consists of two or more units, the frame and one or more sections.

(B-2) Frames—Our stock frames can be furnished in any of four styles of extruded Benedict nickel; four styles of extruded bronze; two styles of kalamein moulding; or two styles of ornamental iron moulding. These can be finished in natural polish, or the various plated finishes as desired. Among these will be found a

SINCE 1870

style to harmonize with any bronze or ornamental iron work. Where special frames are included in the work of the ornamental iron or bronze contractor, Tablet & Ticket sections only are specified.

(B-3) Headings—Two styles of headings are available—a bronze tablet with cast bronze letters or a black background with white letters covered with beveled plate glass.

(B-4) Sections—Each section is a unit in itself. Section frame is of extruded bronze, steel, nickel, or special white metals with beveled plate glass front. The strips fit into grooves in each side of the section frame and are held flat and in perfect alignment against the plate glass front by the broadcloth covered removable wooden back piece.

All standard sections are 7½ in. wide and use No. 1 strips as illustrated. The chart below shows the strip and name capacities of different length sections.

tions. Special size sections with appropriate strips to fit special frames can be supplied.

(B-5) Name Strips—An actual size illustration of No. 1 name strip is shown below. The strips are pliable black cardboard of special texture, ⅜ in. wide, 7⅛ in. long, lettered with ¼-in. glazed white gummed letters, providing sharp contrast and unusual legibility. The name is also typed on the reverse side of strip enabling the operator to see the entire set-up without disturbing the strips when the section back is removed.

The strips slide easily up and down in the side grooves making it convenient to remove or change a single strip without disturbing the others.

HEALTH EXTENSION SERVICE

212

(B-6) Other Directories—Other types of THE TABLET & TICKET Co. directories are: Floor Directories, used on individual floors to show tenants of such floors; Business Directories, giving the business as well as the name of the individual or company; Church Directories; Department Store Directories, for listing the locations of different merchandise departments; Golf Handicap Boards; and Club Membership Directories with our patented "in and out" feature. Specifications will be immediately furnished upon request.

(C) Changeable Bulletin Boards

(C-1) Description—The Tablet & Ticket Changeable Bulletin Boards are made in three types—(1) without glass front; (2) with stationary glass front and take-out back; (3) with hinged glass door. All have the same kind of grooved backboard.

(C-2) Frames—The stock changeable bulletin boards range in sizes from 6x10 in. to 28x40 in. over all. De Luxe models may be of wood moulding or kalamein. Extruded bronze mouldings will be furnished to order. We advise the purchase of stock sizes, but will furnish special sizes at slightly increased cost.

(C-3) Backboards—Backboards have parallel grooves $\frac{5}{16}$ in. apart covered with best quality broadcloth. Black covered backboards only are carried in stock, but any color broadcloth can be furnished on order.

(C-4) Standards—Stock standards are 62 in. high and are furnished in oak, mahogany, or walnut; or bronze or iron. Special finishes on order.

(C-5) Letters and Figures—Our Bulletin board letters and figures are known as Sell-U-Letters. They are die-cut from pyralin .020 in. thick and made with our patented self-spacing flanges. Stock colors are red and white, but any color, including gold or silver, will be supplied on special order.

Sizes range from $\frac{1}{4}$ to 2 in. high in either block or Roman style, single or double flange.

(C-6) Application—These boards are especially adapted for use in banks, hotels, theatres, clubs, hospitals, railroad stations, schools and public buildings, as well as in industrial plants as manufacturing production schedules or sales record boards.

(D) "In" and "Out" Boards

(D-1) Description and Application—We manufacture several styles of Changeable Name "In" and "Out" indicator boards to meet every normal requirement, and are prepared to build special "In" and "Out" boards as may be designed.

Such boards are a necessity in large offices, hospitals, etc., to keep accurate record of the movement of executives, doctors, etc.

(E) Cork Back Bulletin Boards

(E-1) Description and Application—These boards are made like our regular grooved-back boards with the exception the backboard is of cork composition. These can be furnished in any size and the cork backboards may be covered with any color broadcloth or without covering.

These are particularly appropriate for use in banking institutions, retail stores, museums and educational institutions for displaying advertisements, drawings, etc., which are attached to the cork backboard with thumb tacks.

(F) Willson's Gummed Paper Letters and Figures

(F-1) Description and Application—Willson's gummed paper letters and figures are die-cut from highly glazed gummed paper in stock colors of white, red and black, but can be furnished in any desired color on special order. We have a wide range of sizes and styles of letters from $\frac{3}{16}$ to 4 in. high. These are furnished in individual envelopes as well as in small alphabet assortments and large handy box assortments to suit every need.

Paper letters and figures are used extensively in drafting rooms, for marking and lettering drawings and tracings. They photograph perfectly. Free samples will be furnished on request.

Electric Directional Signs

Casings are made of drawn bronze in natural polish, brushed bronze or statuary finish, or drawn steel sprayed any desired color.

Glass faces can have sandblasted letters either embossed or incised with contrasting colors or can be etched in plate glass. Emblems, symbols, trade-marks, etc., can be successfully reproduced.

Standard Mazda lamps of showcase type provide illumination.

Our standard moulding will harmonize with any architectural design, but we will furnish cast or drawn bronze frames of special design on special order.

"Letr-Lite" Standing Type

We have illustrated only one of the four distinct types of Letr-Lite directional signs which are: standing type, hanging type, flat wall type, and flange type.

The type sign required is governed by the place it is to be used and the manner of its attachment.

Product

ARMSTRONG'S CORK BULLETIN and TACK BOARDS for schools, colleges, hotels, lodge rooms, offices, factories, etc.

For Armstrong's Corkboard for Building and Roof Insulation, Cold Storage Insulation, Pipe Coverings and Machinery Isolation, Linoleum, Linotile, and Cork Tile, see Manufacturers' Index.

Description

Armstrong's Cork Bulletin and Tack Boards wood-backed and burlap-backed. Wood-backed boards are composed of a layer of burlap-reinforced cork composition $\frac{1}{4}$ -in. thick cemented securely to a backing of $\frac{1}{4}$ -in. 3-ply wood insert compo board. Burlap-backed board differs from wood-backed in that it does not have the compo board reinforcing.

Particular Advantages of Armstrong's Cork Bulletin and Tack Boards

Because of the peculiar texture of the cork composition used in their construction, Armstrong's Bulletin and Tack Boards are far more satisfactory than wooden ones. Thumbtacks can be pushed easily into the cork. They are held securely and can be removed readily without the use of a tack puller or knife, and without damage to the finger nails. Furthermore, due to the resiliency of the cork, the tendency of the tack holes is to close up gradually. Hence, Armstrong's Cork Bulletin and Tack Boards are not marred by unsightly splinters and retain a much smoother surface than wooden ones. They can be cleaned easily with soap and water.

Sectional View, Armstrong's Wood-backed Cork Bulletin and Tack Board

Sizes

Standard panels of wood-backed board are 4x6 ft. x $\frac{1}{2}$ in. thick. Boards or strips of smaller sizes can be easily sawed on the job from standard panels, or will be supplied by the factory. Larger sizes are furnished in sections.

Burlap-backed material is supplied in a single piece of any desired length and in any width up to 6 ft.

Colors

Both materials can be supplied in either green or tan.

Specifications

Wood-backed Cork Bulletin Boards—Provide and install Armstrong's Wood-backed Cork Bulletin or Tack Boards where indicated on the drawings or herein specified.

(State here where they are required and sizes.)

All tacking spaces of bulletin boards shall be Armstrong's Wood-backed Cork Bulletin or Tack Board material as made by the ARMSTRONG CORK COMPANY, Lancaster, Pa. (This material is to be $\frac{1}{2}$ -in. thick, consisting of one $\frac{1}{4}$ -in. thick layer of cork composition reinforced with burlap and securely cemented to a three-ply backing of compo board with wood core.)

All frames to be of same finish and material to match trim and to have loose cover mould as detailed around all cork bulletin boards. All cork bulletin boards to be securely nailed along all edges before placing cover mould in position.

Grounds—(Paragraph to be included under "Grounds" in Carpentry Specifications.)

Set a 2-in. x $\frac{3}{4}$ -in. thick (thickness will depend on adjoining trim, etc.) wood grounds to receive Armstrong's Cork Bulletin Boards when these are called for on drawings or specified. All grounds shall be set straight and leveled for all edges and in the middle, running the long way of each bulletin board, also where two sections of the bulletin board may join.

Burlap-backed Cork Tack Boards

—Provide and install Armstrong's Burlap-backed Cork Tack Boards where indicated on the drawings or herein specified.

All tacking spaces shall be Armstrong's Burlap-backed Cork Tack Board material as supplied by ARMSTRONG CORK COMPANY, Lancaster, Pa. (This material to be $\frac{1}{4}$ -in. layer of cork composition reinforced with burlap.)

All tack board is to be securely cemented to a finished plaster surface with Armstrong's Waterproof Cement as supplied by the ARMSTRONG CORK COMPANY, Lancaster, Pa., or other suitable adhesive.

All frames to have same finish and material as trim and to have loose cover mould as detailed.

Plastering—(Paragraph to be inserted in plastering specifications.)

Finished plaster to be carried over all areas detailed as cork tack boards.

Product

MUNDET "JOINTITE" BULLETIN BOARDS.

For other Mundet products, including Cork Insulation and Cork Flooring Tile, see Manufacturers' Index.

MUNDET "JOINTITE" BULLETIN BOARD

Uses

Mundet "Jointite" Cork Bulletin Boards are used extensively in schools, colleges, factories, offices, hotels, club rooms and, in general, wherever a soft and durable surface must be provided for the posting of notices. They are easily penetrated by thumbtacks.

Description

Mundet "Jointite" Cork Bulletin Boards are composed of a layer of composition cork $\frac{1}{4}$ in. thick which has been securely cemented to a backing of $\frac{1}{4}$ -in. 3-ply, wood insert, compoboard. It is a neutral brown in color and makes an ideal background in its natural state.

Advantages of Mundet "Jointite" Bulletin Boards

Cork bulletin boards have several advantages peculiar to the material of which they are constructed. They are so much superior to the conventional wooden bulletin board as to render the latter obsolete. The chief reasons the cork bulletin boards are so superior to those of wood construction are:

- (1) A thumbtack can be pushed in with little effort but is held with a firm grip.
- (2) No knife or tack puller is necessary to remove thumbtacks.
- (3) Due to the resiliency of cork, holes made by thumbtacks have a tendency to gradually close. This results in a far better appearing board than one in which there are many unsightly holes.

Sizes

Mundet "Jointite" Cork Bulletin Boards are furnished cut to any size required. The standard mounted sheets measure 4x6 ft. Unmounted, the cork bulletin board can be furnished in rolls measuring 6x60 ft. Cork bulletin boards can be installed by any carpenter. They are easily cut with a saw.

Specifications

Note: Due to the nature of the material, it is usual to include same in the Carpentry Section of the General Specifications as follows:

Cork Bulletin Boards—Furnish and install Mundet "Jointite" Cork Bulletin Boards where indicated on the drawings and as specified.

Note: Specifications should further contain a schedule of locations and sizes.

All bulletin boards shall be Mundet "Jointite" Cork Bulletin Boards as manufactured by L. MUNDET & SON, INC., New York, N. Y.

The material shall be a full $\frac{1}{2}$ in. in thickness, consisting of a $\frac{1}{4}$ -in. layer of composition cork reinforced with a burlap back, securely mounted by cementing same to a 3-ply backing of compoboard with wood core.

All frames shall match the trim and shall have loose cover mould around all cork bulletin boards. All cork bulletin boards shall be securely nailed at edges before cover mould is installed.

Grounds—Set 2-in. wide grounds, of such thicknesses as will be required to conform with that necessary for adjacent trim, to receive Mundet "Jointite" Cork Bulletin Board as called for on drawings, or in specifications. All grounds shall be set straight and level.

A Suggestion for Installation of Mundet "Jointite" Bulletin Board—Front Elevation

BECKLEY-CARDY COMPANY

Manufacturers of Blackboards, Bulletin Boards and School Equipment

17-21 East Twenty-third Street
CHICAGO, ILL.

Products

SLATEBESTOS BLACKBOARD.
SLATEROCK BLACKBOARD.
SLATOPATE BLACKBOARD.
SIMPLEX "H" BAR METAL JOINING STRIPS for BLACKBOARDS.
SIMPLEX and DUPLEX BULLETIN BOARDS and TACKBOARDS.

The Company

For almost a quarter century we have specialized in the manufacture of blackboards and school equipment for educational institutions. During this period we have built up manufacturing facilities, financial responsibility and gained experience that makes it possible to serve you with the very best of tested and guaranteed materials and to give prompt and intelligent service.

Slatebestos—the Permanent Blackboard

Quality—A new standard of excellence for blackboards.

Hard as rock, and its dark slate color permeates the entire board. Permanence and Durability—Base is a combination of asbestos fiber, hard minerals and cement which actually improves with use. Slatebestos will last as long as the building in which it is installed; is equally as durable as natural slate, more fire resistant and less subject to breakage.

Color and Writing Surface—Slatebestos is solidly built throughout its full $\frac{1}{8}$ -in. thickness. Its writing surface is produced through a series of liquid blackboard surfacing coats, which penetrate the body of the board. The method is to apply each coat and then rub it down, thus building up the incomparable, velvet-light, non-reflecting dark slate color writing surface which is ideal for rapid and legible writing.

Easy to Install—Installed on any kind of straight wall. Because it has extreme density and practically no expansion, it is very easy to put up. Joints can be made secure so that writing over them is always possible, thus forming a continuous writing surface.

Sizes and Weights—Standard widths $3\frac{1}{2}$ and 4 ft.; lengths 6, 7 and 8 ft. Thickness $\frac{1}{8}$ in. Weight approximately $2\frac{1}{4}$ lb. per sq. ft. Furnished in black.

Shipment—Carried in stock at Chicago. Immediate shipments assured.

Slatebestos Guarantee—We guarantee Slatebestos Blackboard, when properly installed and cared for according to our printed instructions, to give satisfactory service during the life of the school building.

Slaterock Blackboard—Natural Slate's Rival

Description—Consists of a core of pure gypsum rock comprised between two sheets of tough mineralized fiber boards.

It has a hard, velvety writing surface of uniform color. The surface is long wearing, does not reflect light and contains a sufficient amount of grit to insure easy, rapid and legible writing. Costs one-half as much as natural slate and weighs approximately one-third less.

Easy to Install—It is true and straight, cannot warp, crack or buckle and is not affected by atmospheric changes, can be easily installed by inexperienced labor over brick, stone, plaster or bare studding.

Durability—There is no breakage with Slaterock and it will last as long as the building.

Shipments—Stocked at Chicago. Immediate shipments assured.

Sizes and Weights—Standard widths, 3, $3\frac{1}{2}$ and 4 ft.; lengths, 1 to 8 ft. inclusive. Thickness, $\frac{3}{8}$ in. Weight, approximately $2\frac{1}{2}$ lb. per sq. ft.

Color—Can be furnished in black or green.

Slatoplate—the Perfect Blackboard

Description—Slatoplate is a wood pulp composition blackboard—less expensive than Slaterock. Made of new, pure wood fibers, hardened and toughened by special processes, kiln dried, waterproofed and surface filled.

Stiffer, harder and stronger than most common position blackboards. Writing surface is hard, close grained, uniform in color and has enough bit to cut crayon noiselessly. Makes clear, legible mark.

Slatoplate will not warp, pit, peel, crack, wear shiny, change color or lose its splendid writing surface. Cannot be easily indented and corners will not split. Writing can be easily erased.

Easy to Install—Can be easily applied over brick, stone, plaster or bare studding by inexperienced labor.

Shipments—Stocked at Chicago. Immediate shipments assured.

Sizes and Weights—Standard widths, 3, $3\frac{1}{2}$ and 4 ft.; lengths from 1 to 12 ft. Thickness, $\frac{1}{4}$ in. Weight, approximately 1 lb. per sq. ft.

Colors—Can be furnished in black or green.

Slaterock and Slatoplate Guarantee

We guarantee every sheet of Slaterock and Slatoplate blackboard to be equal in quality to any samples (since samples are cut from odds and ends of regular stock). Properly installed and cared for, they will give entire satisfaction for a period of many years. In most cases, Slaterock will last the life of the building.

Simplex "H" Bar Metal Joining Strips for Blackboards

Use—Suitable for covering the joints of Slatebestos, Slaterock and Slatoplate blackboards, thus eliminating the unsightly bump caused by half-round mouldings.

Description—The Simplex strip is made "H" shape and fits between two lengths of blackboards. The two upper wings cover the joints, lie flat against the blackboard and form a continuous level writing surface.

Lengths and Colors—Lengths 3, $3\frac{1}{2}$ and 4 ft. Finished in dull black or green to match color of blackboard.

Bulletin Boards and Tack Strips

Use—These are as essential as blackboards in the modern school, and are easily installed. Bulletin Boards and Tack Strips can be placed above the blackboard in strips and in panels at the ends; also in panels in doors and partitions.

Simplex Bulletin Boards and Tack Strips

Description—Simplex Bulletin Boards are made uniformly $\frac{1}{4}$ in. thick of pressed cork of unvarying color and resiliency, cemented to burlap backing. The cork surface holds pins or thumb tacks securely and does not show holes when tacks are removed.

Simplex Bulletin Boards will not warp, curl or buckle and when soiled can easily be cleaned with soap and water. They are easy to install by cementing to the wall or nailing along all edges before putting the tack moulding in position.

Sizes and Colors—Regularly made and carried in stock in 6, 9, 12, 14, 18, 24, 30, 36 and 48-in. widths and lengths cut to fit spaces up to 60 ft. without joint. Furnished in light brown or green color.

Duplex Bulletin Boards and Tack Strips

Description—Made in $\frac{1}{2}$ -in. thickness, consisting of $\frac{1}{4}$ -in. sheet cork cemented to special $\frac{1}{4}$ -in. wood fiber composition backing.

Sizes and Colors—Regularly made and carried in stock in 12, 18, 24, 30, 36 and 48-in. widths and in 48, 60, 72, 84 and 96-in. lengths. Boards larger than 48x96 in. furnished in sections. Furnished in light brown or green color. Samples on request.

MASTER SPECIFICATIONS FOR BLACKBOARDS

(A) CORRELATIVE SPECIFICATION DATA

Note: To insure a perfect blackboard installation, the following clauses should be incorporated in the various divisions of the specifications, as they apply.

Note: It is suggested that blackboards be included under a separate division of the specifications.

(A1) Include Under Carpentry Work

(A1a) All blackboards, except as hereinafter otherwise mentioned, will be furnished and set by others.

(A1b) The following blackboards will be furnished cut to size and crated separately by the Blackboard Contractor to be set by this contractor who shall be entirely responsible for their good condition after delivery.

Note: Here list blackboards which are to be set by the Carpentry Contractor, such as those in wardrobe or other door panels, etc.

The list and sizes (allowing $\frac{1}{4}$ in. clearance) shall be furnished by the Carpentry Contractor to the Blackboard Contractor.

(A1c) Provide accurately set grounds, in accordance with the detailed drawings, surrounding all blackboards and cork tack boards and bulletin boards. These grounds shall not only form proper nailing base for the blackboard trim, but shall provide nailing at top for blackboards and form accurate screeds for plaster surfaces back of blackboards.

(A1d) All grounds shall be S4S, grade B, select white pine free from knots, sap or other deleterious defects for (here specify thickness and number of coats of plastering).

Grounds shall be securely fastened in position every 16 in. on center, set absolutely true to line, level, plumb and in perfect surface alignment. All nails shall be slightly set.

(A1e) Plug the wall back of blackboard joints with three wooden plugs set 12 in. apart below the wood grounds.

(A1f) In locations hereinafter listed, this contractor shall provide wood blackboard grounds and frames on walls of finished brickwork. Frames shall be as detailed. Ground frames shall be of same material and construction as specified for blackboard grounds, accurately set, with vertical intermediates at each joint and midway between joints. Attach every 2 ft. on center with $\frac{1}{4}$ in. flat headed wood screws (head countersunk) secured to brickwork with "Diamond N. Y." screw anchors.

Note: Here list locations so provided.

(A1g) Grounds set directly on unfurred exterior masonry walls shall be painted with (here specify wood preservative to be used) or an approved equivalent. (Omit if walls are thoroughly dampproofed.)

(A2) Insert Under Lathing and Plastering

Note: We recommend that plastering be omitted behind all blackboards and a backing of Celotex, Masonite or similar material substituted.

(A2a) This contractor shall check all grounds for blackboards as specified under division of "Carpentry Work." Thickness of grounds shall be such that plastering back of blackboards is flush with surfaces of grounds.

(A2b) Plaster, flush with grounds, all surfaces back of blackboards. Plaster surfaces shall be in a true plane without projections beyond the face of ground work.

(A2c) Wherever blackboards are applied against unplastered masonry walls, a backing of insulation board shall be provided.

(A2d) The finish coat of plaster may be omitted back of blackboards, but the brown coat shall be floated to a true plane in perfect alignment with the grounds.

(A2e) Wherever blackboards are installed on outside walls which are not furred, the masonry back of plastering shall be given two (2) good coats of dampproof paint.

(A3) Insert Under Painting

(A3a) All blackboard trim (except inner loose tack mould) shall be completely finished before blackboards are set.

(A3b) The inner loose tack mould of blackboard trim shall be finished up to the last coat before installation. After blackboards are set and the inner mould attached, this contractor shall apply the last coat of finish.

(A3c) Great care shall be exercised by this contractor that no painter's finish, by accident or otherwise, is applied to the blackboard surfaces. Any varnish or other finish appearing on blackboard surfaces will be renewed without injuring the writing surface and the surface refinished (or new boards erected) by the Blackboard Contractor at this contractor's expense.

(B) BLACKBOARD SPECIFICATIONS

Note: The following clauses shall be included under the blackboard specification where and when they apply.

(B1) Correlated Work

The following correlated work is done under other contracts and is covered under the following specification divisions. Before the erection of blackboards, this contractor shall examine all correlated work and shall report to the architect in writing any inaccuracies or variation from the specification requirements which will in any way deleteriously affect work under his contract. Failure to so report defects, etc., if any, is construed as acceptance of the work executed and release of those responsible.

(B1a) **Carpentry Work**—(here refer to paragraphs under this heading of correlated work affecting this contract).

(B1b) **Lathing and Plastering**—(here refer to paragraphs under this heading of correlated work affecting this contract).

(B1c) **Painting**—(here refer to paragraphs under this heading of correlated work affecting this contract).

(B2) Diagrams and Cutting Schedules

This contractor shall furnish to the architect, in triplicate, for his approval the manufacturer's cutting diagrams and cutting schedules, showing disposition of joints and blackboard sizes for the various rooms; distinctly and accurately allocated.

(B3) Materials

(B3a) **Blackboards**—Blackboards shall be (Slatebestos) (Slatelock) (Slatoplate) as manufactured by Beckley-Cardy Company, 17-21 E. Twenty-third St., Chicago, Ill.

All blackboards shall have perfectly true and uniform surfaces, free from defects and from depressions or projecting particles. Joint edges shall be sharp and make 90 degree angles with top or hanging edge. The bottom edge shall be parallel with the top edge.

(B3b) **Cement**—Cement for spot cementing shall be Beckley-Cardy's "B-C" No. 4 Blackboard Cement.

Note: Omit if Slatoplate or Slatelock is specified.

(B3c) **Metal Blackboard Joints**—Blackboard joints shall be made with Simplex "H" Metal Joining Strips as manufactured by Beckley-Cardy. Finished to match color of blackboard. All joint mouldings shall be without surface defects, smooth and straight.

(B3d) **Tack Board**—All tack strips and bulletin boards shall be Beckley-Cardy Co.'s (Simplex Bulletin Boards and Tack Strips) or (Duplex Bulletin Boards and Tack Strips). Sizes as called for on schedules.

(B4) Sizes and Lengths

(B4a) **Widths**—All blackboard widths (height from chalk rail to top) shall be as designated on the detail drawings and schedules.

(B4b) **Lengths**—(for Slatebestos or Slatelock). All sections up to 6, 7 or 8 ft. shall be in one piece. All sections over 8 ft. and up to 16 ft. shall be in two pieces. Longer sections shall be in multiples of 6, 7 or 8 ft. or fractions thereof, but arranged with joints symmetrically spaced and with no piece for filling out less than 3 ft. in its horizontal dimension.

(B4c) **Lengths**—(for Slatoplate). All sections up to 12 ft. shall be in one piece. All sections over 12 ft. and up to 24 ft. shall be in two pieces. Longer pieces shall be in multiples of 12 ft. or fractions thereof, but arranged with joints symmetrically placed and with no piece for filling out less than 3 ft. in its horizontal dimension.

(B5) Storing

All blackboard material shall be properly stored at the building site in such manner as to adequately protect it from moisture or other damage.

(B6) Uncrating

(B6a) All material which is to be set by the Carpentry Contractor shall be shipped in separate crates and delivered to him crated as received from the manufacturer.

(B6b) All material to be erected by this contractor shall be uncrated in accordance with manufacturer's directions.

(B7) Distributing Sections

Distribute the material to the rooms and to the locations in each room in their order as indicated on the crates and sections to conform with the cutting diagrams and sections.

(B8) Sizing

On outside walls, not furred and not dampproofed back of plaster, thoroughly size the plaster surface back of blackboards with glue sizing.

Note: Include wherever dampness is apparent or possible sizing is advisable, otherwise the special spotting cement may be affected.

(B9) Setting

(B9a) The setting, leveling and cutting of blackboard installations shall be in accordance with the manufacturer's recommendations and standard specifications.

(B9b) Blackboards shall not be set until the plaster is completely dry and the final coat of finish has been applied and has dried on the wood blackboard trim (except loose tack mould).

(B9c) All blackboards shall be set by experienced mechanics so that all edges shall be adequately covered by the loose tack mould. The writing surfaces shall be plumb and in a true plane with $\frac{1}{8}$ in. clearance at top and $\frac{3}{8}$ in. clearance at bottom and ends.

(B9d) All blackboards shall be hung from top edge only, securely nailed to top ground with 4d nails.

Wire nails placed $\frac{3}{8}$ in. from edge and not over 18 in. on center, driven through drilled holes in board. Boards showing splits at nailing points below the finishing tack mould will be rejected and must be replaced at this contractor's expense.

(B9e) Slatebestos shall be nailed at top edge only. The balance of Slatebestos Blackboard Surface shall be secured to wall in the following manner: Cement back of blackboard in strips 3 in. wide the entire width (or up and down of the board) and spaced 18 in. apart. Between the cement strips place cement on blackboard in two rows of round spots about 3 in. in diameter and at a distance of 15 in. from top and bottom edges. Sufficient cement shall be used at the joints to firmly bed for a space of 1 in. on each side. Cement must not get into joints or on the surface.

(B9f) The boards shall be firmly pressed in position over the cement and leveled plumb and true. Sufficient pressure

shall be applied to assure thorough adhesion without springiness for the entire surface. After boards have been cemented into position, all tack moulding shall be immediately set in place and securely bradded.

(B9g) (Slatelock) or (Slatoplate) shall be nailed at top edge only, nails to be not over 18 in. apart and spaced according to location of studding or grounds. Then secure Slatelock or Slatoplate in position with tack moulding on all sides.

(B9h) All tack mould shall be carefully and accurately bradded in position by this contractor with firm, continuous contact at all edges and with brads neatly set for putting.

(B10) Joints

(B10a) Metal Joint Moulding—All joints shall be made with Simplex "H" Bar Metal Joining Strips. The joining strips shall be made the full width of the blackboard extending back of the tack mouldings which shall be neatly notched over them at top and bottom.

After plugs (provided by others) are in place and the blackboards ready to set up, attach the joining strip to one end of the blackboard and then nail through the wing of the strip into the plugs. Place the next section of board into the groove of the strip and level and plumb the board. Continue the operation until all joining strips are in place. Allow $\frac{1}{8}$ in. space at each joint when installing joining strips. Joining strips with surface imperfections or which are warped out of line shall not be used.

(B11) Tack and Bulletin Boards

Set all cork tack and bulletin boards in accordance with manufacturer's directions. Where joints are required, same to be spaced symmetrically to correspond with blackboard joints and shall be covered with a thin strip of wood to match trim. Apply tack mouldings surrounding tack and bulletin boards as specified above for blackboards.

(B12) Final Cleaning

After the painter has applied the final coat of finish to the tack mould, this contractor shall do the final cleaning of all blackboard surfaces, charging the reasonable cost thereof to those responsible for any damage. All varnish spots or streaks shall be removed with steel wool; apply Beckley-Cardy Blackboard Surface, rubbed down with fine pumice and water, blending the spots with the rest of the board surface.

(B13) Direction Plate

Fasten permanently in each room, the metal plate; furnished by the blackboard manufacturer, bearing directions for breaking in and taking care of blackboard surface. Location as directed by architect.

Product

NATURAL SLATE BLACKBOARDS.

Service and Organization

Foremost in the minds of the various producers of slate who form the NATURAL SLATE BLACKBOARD COMPANY, is the necessity of giving the consumer all of the information which will enable him to advantageously use the material.

In order to assure to architects, constructors and owners the best available data, the NATURAL SLATE BLACKBOARD COMPANY has had the Structural Service Bureau of Philadelphia conduct extensive investigations into the production and utilization of natural slate for blackboards. The information thus obtained has been put into available form for use in laying out the blackboards and also for specifying the same in varying forms of construction.

Certain of this informative data is published in these pages, which also contain the specifications finally adopted. Detailed drawings on the following page show typical standardized methods of application.

In the pages of the Structural Slate Company within this issue of SWEET'S ARCHITECTURAL CATALOGUE will be found reference to a series of publications which contain much information of value concerning the characteristics and production of slate for structural uses.

Advantages of Slate for Blackboards

The structure and characteristics of natural slate are such that the surface may be brought to a finish which is unexcelled for blackboard purposes. It results in a smooth, even, dark writing surface upon which chalk marks are clearly legible and which may be easily erased or cleaned.

As slate is not affected by atmospheric changes in the classroom, its true, velvetlike surface remains constant under all conditions and does not wear out or require replacement. The first and only cost in natural slate blackboards is in furnishing and installing them at the time the building is constructed. In order that they may be properly erected it has been the endeavor of the NATURAL SLATE BLACKBOARD COMPANY to place at the service of all users of natural slate blackboards their years of experience in this installation.

The "Pyramid" brand, which name is given to all slate furnished by the NATURAL SLATE BLACKBOARD COMPANY, was adopted as a trade-mark to designate the material distributed by this company, and as a guarantee of the enforcement of the most rigid rules of workmanship and inspection in order to assure the best possible selection for the purpose.

Heights, Widths, and Areas Required

The ages of the pupils in the various grades should determine the height at which blackboards are to be placed above the floor. In a district school where children of all grades may be in a single room, the board is usually placed at an average height of 2 ft. 4 in. from the floor to the

chalk rail. In some cases the board behind the teacher's desk is set higher than the others as it may be used entirely for illustration work.

Nearly all states and the larger cities have adopted requirements governing the height of chalk rails and the area, height and width of blackboards. The tables and data here presented represent standard requirements compiled from the sources noted.

STANDARD HEIGHTS OF CHALK RAILS AND BLACKBOARDS

Grade	Height of chalk trough		Height of blackboard		Top of board above floor	
	New York ft.	Boston in.	New York ft.	Boston in.	New York ft.	Boston in.
Kindergarten	2	0	2	2	4	0
1st, 2d, 3d...	2	0	2	2	4	0
4th.....	2	6	2'4"	2'6"	6	0
5th, 6th.....	2	6	2	8	6	0
7th.....	3	0	2	8	6	0
8th.....	3	0	2	8	6	0
High schools	3	0	2	8	6	0

For colleges it is usual to set the board 3 ft. above the floor and use a 4-ft. width.

BLACKBOARD AREAS

High Schools

Lecture rooms.....Not less than 50 sq. ft.
Manual training room.....15x4 ft.
Drafting rooms.....15x4 ft.
Cooking rooms.....10x4 ft.
Chemical laboratory.....Board parallel to desk section and back of demonstration table.
Physical laboratory.....As much board as possible.
Botanical and zoological laboratory.....50 sq. ft. of board.

Colleges

Small lecture rooms.....Blackboard back of instructor's desk and full on one side.
Laboratories generally.....15 to 20 lin. ft.
Lecture room for mathematics.....All board space possible.
Drafting rooms.....About 15 lin. ft.

"Not less than 80 ft." of blackboard are required for the walls of each classroom by the Pennsylvania State Board of Education, which also requires the following heights and widths as best suited to the uses indicated:

Primary rooms.....21 in. above floor
Elementary rooms.....25 in. above floor
High school rooms.....30 in. above floor
Boards should be not less than 3 ft. 6 in. wide, but 4-ft. widths are more suitable for accommodating all grades.

ARCHITECT'S SPECIFICATIONS FOR BLACKBOARDS OF NATURAL SLATE

The following notes and specification paragraphs (1) to (11) have been prepared by the Structural Service Bureau of Philadelphia in collaboration with the NATURAL SLATE BLACKBOARD COMPANY and embrace the essentials of Simplified Practice Recommendations No. 15, on Blackboard Slate, of the United States Department of Commerce.

Notes: A complete specification for the furnishing and setting of blackboards affects the work of several different trades. In connection with this specification the specification for carpentry and millwork should call attention to requirements in regard to the grounds, trim, etc., to be furnished and set, and the kind of wood should be specified. It should be noted whether or not switches, thermostats, etc., are to be placed in trims of openings; and these trims designed accordingly. The location of switches, thermostats, etc., should be also specified under electrical work, heating work, etc.

Under masonry the setting of blocks or plugs to be built into the walls should be provided for. Under plastering it should be noted whether or not the walls back of the boards are to be plastered and under painting the finishing of the exposed frame and trim should be provided for.

(1) The general contractor shall furnish and arrange for the complete installation of Natural Slate Blackboards in every classroom (in the Manual Training room, the Domestic Science room, in all Laboratories and in the Assembly Hall) and in all other portions of the building where so shown or noted on the drawings.

(2) On all walls where blackboards occur they shall run full to corners and trim of openings. The heights of the slate to be as follows (state heights and whether single height or "double-tier").

(3) Where wardrobes occur in classrooms, place slate blackboards in each door, as follows (describe recessed panels, etc.).

(4) The slate shall be the finest quality selected blackboard stock, even in color, free from veinings or imperfections and not less than $\frac{1}{4}$ or more than $\frac{3}{8}$ in. thick. A maximum deviation of $\frac{1}{8}$ in. from this thickness will be permitted when an average thickness of at least $\frac{1}{4}$ in. is maintained. Each piece of slate shall be guaranteed to be Pyramid brand and shall

be surfaced in accordance with the NATURAL SLATE BLACKBOARD COMPANY'S standards.

(5) Slate shall be furnished with joints ground straight, true and neatly fitted. Spaces up to 5 ft. shall be in one slab; over 5 ft. but not exceeding 9 ft., in two slabs; over 9 ft. but not exceeding 13 ft. 6 in., in three slabs; over 13 ft. 6 in. but not exceeding 18 ft., in four slabs; over 18 ft. but not exceeding 22 ft. 6 in., in five slabs; over 22 ft. 6 in. but not exceeding 27 ft., in six slabs.

(6) The carpenter-contractor will furnish and set all grounds and will set all blackboards complete, with trim. All trim will be furnished by the millman. The complete installation shall be in accordance with the details and with the printed directions of the NATURAL SLATE BLACKBOARD COMPANY, consistent herewith.

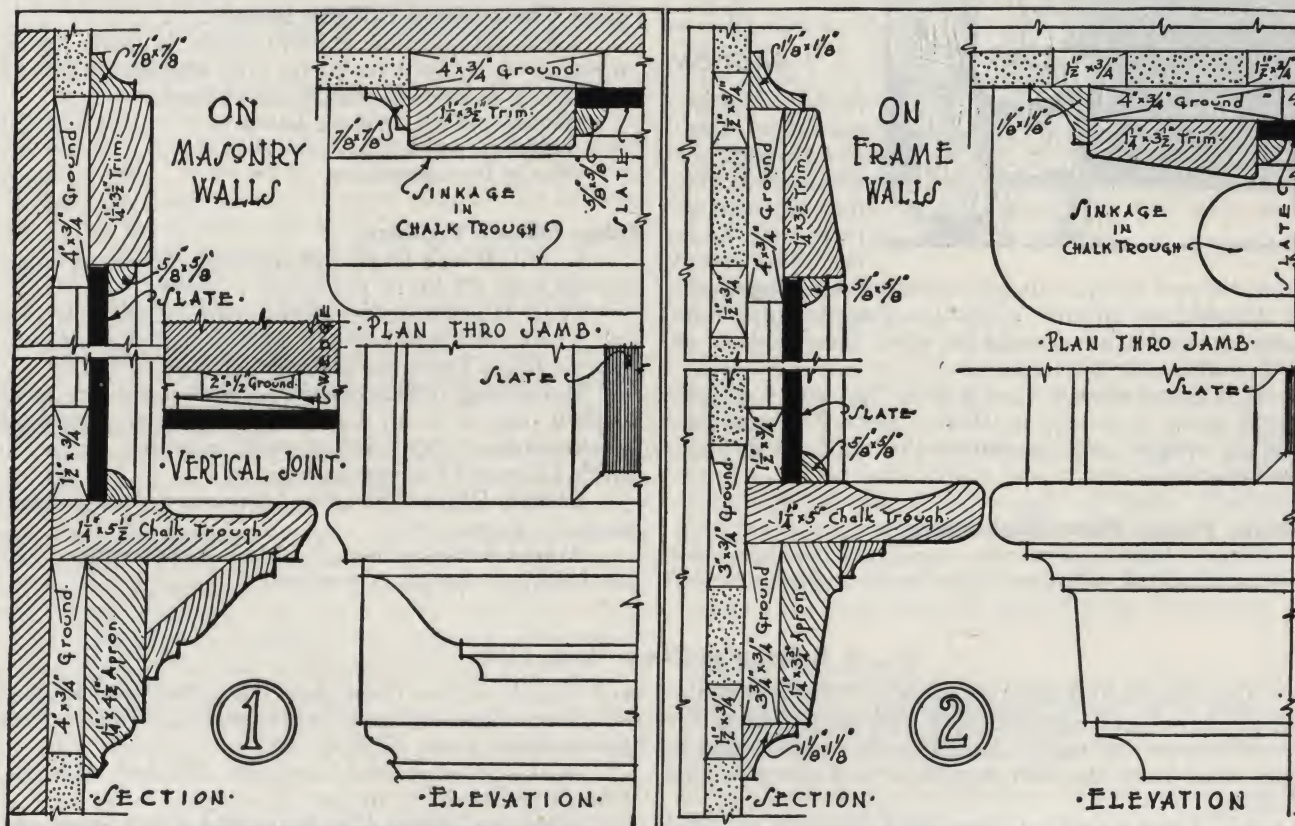

(7) Fasten securely to the walls, kiln-dried white pine "ground" strips $4 \times \frac{3}{4}$ in. at top, bottom and ends of all spaces to be occupied by blackboards (and intermediate strip near top if double-tiered). Back of all joints in slate securely place $2 \times \frac{1}{2}$ -in. white pine strips and, when blackboards are being set, tap wood wedges behind slate and glue and sprig the wedges to these uprights.

(8) To the "ground" strips, above mentioned, securely set $1 \frac{1}{4} \times 3 \frac{1}{2}$ -in. trim, slightly rounded at edges.

(9) At bottoms of blackboards place $5 \frac{1}{2} \times 1 \frac{1}{4}$ -in. countersunk chalk troughs carefully leveled extending under blackboards to face of wall (or studs) and securely nailed to "ground" strips and to $4 \frac{1}{2}$ -in. moulded aprons. Chalk trough shall be (moulded or rounded) on all exposed edges and returned at ends (or left open for cleaning), as detailed.

(10) As the blackboards are set, a $\frac{5}{8} \times \frac{5}{8}$ -in. quarter-round shall be well secured to surrounding trims and chalk trough, firmly holding slate in place. Any free standing end trims and all tops shall be back-banded with $\frac{7}{8}$ -in. coved scotia mould ($1 \frac{1}{4}$ in. if on frame walls).

(11) The joints between slate shall, after being wedged as before specified, be made tight with special glue or jointing compound, which shall be furnished with the slate, and after completion of setting, joints shall be shaved and scraped to have the appearance of a smooth plane with adjoining surfaces. All slate blackboards shall be left sound, clean-black, ready for use and in every way a complete and satisfactory installation.

Two Typical Details of Blackboard Installations

(1) Detail of installation on masonry walls, (2) detail of installation on frame walls. Scale as printed 3 in. equals 1 ft.

 HOBOKEN, N. J.

ANTISEPTIC GLASS AND SILICATE COMPOSITION BLACKBOARDS—CORK COMPOSITION BULLETIN BOARDS

Seloc Antiseptic Glass Blackboards

We have recently developed a glass blackboard which combines all of the virtues of the best natural slate with none of its defects. The board is a deep black and we guarantee it will not fade nor wear smooth. It has a velvety surface, free from all imperfections.

It is made under United States patent and consists of black plate glass with a suspended abrasive uniformly dispersed throughout the glass while

wears, the new surface always contains the same amount of abrasive as did the original. Experimental tests equivalent to 100 years wear have left the sample in as good condition as when new.

It is being offered in widths 3, 3½, and 4 ft. and lengths up to 8 ft. ⅝-in. thick. Price 75¢ a sq. ft., shipping weight and installation the same as for natural slate.

Silicate Veneer Plate Blackboards

These blackboards are composed of the best grades of wood pulp, the four veneers firmly united

SECTION

molten. The dispersion of abrasive through the glass means that, over a period of many years, as the blackboard

under great pressure. The marking surface is Silicate Black Diamond Slating. They can be put on any wall.

Blackboards come in sizes 3, 3½ and 4 ft. wide up to 12 ft. long, at 20¢ a sq. ft. for black, and 22¢ for green.

Write for discounts.

Specifications—Architects should specify Silicate Veneer Plate Blackboard made by the NEW YORK SILICATE BOOK SLATE CO.

Four-ply, ¼-in. Thick Silicate Veneer Plate Blackboard, Surfaced One Side

Cork Composition Bulletin Board

Cork composition bulletin board is made by cementing ¼-in. cork on ¼-in. pulp board.

Stock sizes cork composition board:

Widths: 12, 18, 24, 36, 42 and 48 in.

Lengths: 4, 5, 6, 7, 8, 9, 10 and 12 ft.

Write for quotations.

Other Silicate Products

Liquid Black Diamond Slating—Covering capacity, one coat, 25 sq. ft. per ½ pt. of liquid.

Wall Blackboards—Ready made. Sizes 1½x2 to 4x8 ft., finished both sides. Oak frames. Marking surface of Black Diamond Slating.

Revolving Blackboards—Firm stand of nicely finished oak, to fit all sizes of boards in regular stock. Blackboards of 6-ply silicate with marking surface of Black Diamond Slating, both sides.

Slated Cloth—Flexible blackboard for lecturers, teachers, stores, etc.

Marks finely, erases quickly. Rolls tightly, without injury to design or surface.

References Cover Wide Field

The Boards of Education of New York and Philadelphia have been supplied with Silicate products for over 40 years, and eighty-three Boards of Education in other cities have also been supplied for various lengths of time.

The United States Government has been supplied for over 40 years.

Many schools in Havana, Cuba, and Porto Rico,

and Manila in the Philippines have also been supplied. Bainbridge, Kimpton & Haupt, Inc., 218 Greenwich Street, New York, N. Y.

A. L. Salomon and Company, 546-548 Broadway, New York, N. Y.

Goods have been shipped to all parts of the world.

E. W. A. ROWLES CO.

Manufacturers of Blackboards

2345-2351 South LaSalle Street, CHICAGO, ILL.

Products

(A) **ENDURAROC BLACKBOARD SYNTHETIC SLATE**—Composed of asbestos fibre, cement and carborundum.

(B) **PERMAROC BLACKBOARD**—Body, gypsum rock and mineralized fibre boards; surface, heavy troweled-on slate surface.

(C) **DUROPLATE**—Body, pure wood fibre board, thoroughly waterproofed; surface, troweled-on slate surface.

(D) **ROWLES TACK BOARD**—High grade brown sheet cork securely cemented to wood fibre base.

For our page on Window Shades, see Manufacturers' Index.

Experience

The E. W. A. ROWLES Co., one of the largest manufacturers of blackboards in the United States, has been continuously in business under the same management for thirty-four years. The unqualified guarantees covering the company's products are backed by an established financial integrity.

Facilities

Our factory, a model of efficiency, devotes approximately 30,000 sq. ft. of space to the manufacture of blackboards. Plant capacity is from 5000 to 8000 sq. ft. of finished blackboard per day. All blackboards are manufactured under rigidly supervised, controlled processes. Uniformity of quality is positively guaranteed.

Cost Comparison

The comparative light weight, affecting handling and shipping costs, ease of erection by the average good mechanic (not an experienced, high priced blackboard setter), effect worthwhile economies. The following comparative costs of blackboards installed are affected somewhat by location and local labor conditions:

(1) **Enduraroc**—From 60 to 70 per cent of the cost of natural slate. Weight 3 lb. per sq. ft. crated.

(2) **Permaroc**—From 50 to 60 per cent of the cost of natural slate. Weight 2½ lb. per sq. ft. crated.

(3) **Duroplate**—From 35 to 40 per cent of the cost of natural slate. Weight 1 lb. per sq. ft. crated.

Enduraroc Blackboard

Enduraroc is a synthetic slate blackboard composed of asbestos fibre, finely ground slate, black mineral pigment, portland cement and carborundum, combined by our own distinctive process. The sheets are pressed into dense homogeneous slate colored panels under hydraulic pressure of 3000 lb. per sq. in. Enduraroc is black clear through. It has a wiry resiliency which resists breakage in handling and shipping. Its tensile strength, hardness and toughness increase with age. It is harder than natural slate and weighs only half as much. Surface is smooth and of uniform color, free of such defects as webs, metallic veins, streaks, hard and soft spots, etc.

Sizes—Enduraroc is carried in stock 3½ and 4 ft. wide in 5, 6, 7, and 8-ft. lengths. Finished thickness is full ¼ in.

Color—Black.

LOCAL REPRESENTATIVE

Permaroc Blackboard

Composition—Base or body is composed of gypsum rock, carefully ground and treated, pressed into uniform sheets between two layers of mineralized fibre board.

Permaroc is fireproof, moistureproof and guaranteed not to warp, contract or expand. It is readily cut to a clean, sharp edge with ordinary tools. The thick writing surface is applied over one surface of the body and consists of ground slate (slate flour), color carborundum, and other pigments. It is applied by trowel and ground down to a uniform slate finish free from defects.

Sizes—Permaroc is carried in stock 3, 3½ and 4 ft. wide in any length in even feet up to and including 8 ft. Finished thickness is full ¾ in.

Color—Black.

Duroplate

Composition—Base or body is composed of specially selected, long, wiry spruce fibres combined to prevent warpage. Each panel is scientifically kiln cured, waterproofed and surface filled under an exclusive original process. Duroplate is a fire retardant, permanently moistureproof and guaranteed, when properly installed, not to warp. It is readily cut to a clean, sharp edge with ordinary carpenters' tools. Writing surface, as previously described, is applied over one surface of the body and is identical with the surface of Permaroc, except that there are fewer coats or layers applied and writing surface is correspondingly thinner.

Sizes—Duroplate is carried in stock 3½ and 4 ft. wide in 6, 7, 8, 10 and 12-ft. lengths. Finished thickness is full ¼ in.

Colors—Blue-black and dark green.

Special Duroplate Clincher—Duroplate is held firmly and permanently against the wall with special metal clinchers (an exclusive feature).

Rowles Metal Joint

While Enduraroc and Permaroc blackboards may be erected with close blackboard cement joints, we advocate the use of Rowles Metal Joints for all blackboards. The zinc metal joint is accurately true, projecting but ⅛ in. above the board surface. It is finished in dull black, is inconspicuous and provides a permanent, practical joint cover and reinforcement with the advantage of ease and economy of labor. Due to the long lengths of boards the minimum number of joints are required.

Duroplate is always erected with Rowles Metal Joints (see illustration on second page following).

Rowles Tack Board

Composition—¼-in. thick brown cork cemented to a ¼-in. wood fibre base. Tack holes close on removal of tracks.

Size—Rowles Tack Board is carried in stock 12, 18, 24, 36, 42 and 48 in. wide in 48, 60, 72, 84 and 96-in. lengths, full ½ in. thick.

Adaptability—In all grade schools above and at the sides of all blackboards for the display of photos, charts, drawings and exhibits of all kinds.

In high schools, a sufficient number of 2 to 3-ft. wide bulletin boards in alignment with the blackboards for ample display in each classroom.

MASTER SPECIFICATIONS

(A) Preliminary Specification Requirements

Note: To assist in providing a perfect blackboard installation the following clauses should be included under specifications divisions where and when they apply.

Note: It is suggested that blackboards be included under a separate specification division.

(A1) Include Under Carpentry Work

(A1a) All blackboards, except as hereinafter otherwise mentioned, will be furnished and set by others.

(A1b) The following blackboards will be furnished cut to size and crated separately by the Blackboard Contractor to be set by this Contractor who shall be entirely responsible for their good condition after delivery.

Note: Here list blackboards which are to be set by the carpentry contractor such as those in wardrobe or other door panels, etc.

The list and sizes (allowing 1/4-in. clearance) shall be furnished by the Carpentry Contractor to the Blackboard Contractor.

(A1c) Provide accurately set grounds, in accordance with the detailed drawings, surrounding all blackboards and cork tack boards and bulletin boards. These grounds shall not only form proper nailing base for the blackboards, but shall provide nailing at the top (and bottom for Duroplate) for blackboards and form accurate screeds for plaster surfaces back of blackboards.

(A1d) In addition to grounds above provide horizontal grounds the full length of the blackboard space to receive Duroplate Clinchers. For boards 3 ft. wide provide 2 rows of horizontal grounds; for boards 3 1/2 and 4 ft. wide provide 3 rows of horizontal grounds.

Note: Omit if Endurac or Permaroc blackboards are specified.

(A1e) All grounds shall be sound S4S material free from knots, sap or other defects for (here specify thickness and number of coats for plastering).

Grounds shall be substantially secured in position every 16 in.

on centers, set absolutely true to line, level, plumb and in perfect surface alignment. All nails shall be slightly set.

(A2) Include Under Lathing and Plastering

(A2a) This contractor shall check all grounds for blackboards as specified in paragraphs pages under division of "Carpentry Work." Thickness of grounds shall be such that plastering back of blackboards is flush with ground surfaces.

(A2b) Plaster all spaces back of blackboards flush with grounds. Surfaces shall be in a true plane without projections beyond the face of ground work.

(A2c) The finished coat of plaster may be omitted back of blackboards, but the brown coat shall be floated to a true plane in perfect alignment with the grounds.

(A2d) Wherever blackboards are installed on outside walls which are not furred, the masonry back of plastering shall be given two good coats of dampproof paint.

(A3) Include Under Painting

(A3a) All blackboard trim (except inner loose tack mould) shall be completely finished before blackboards are set.

(A3b) The inner loose tack mould of blackboard trim shall be finished up to the last coat before installation. After blackboards are set and the inner mould attached, this contractor shall apply the last coat of finish.

(A3c) Great care shall be exercised by this contractor that no painters finish, by accident or otherwise, is applied to the blackboard surfaces. Any varnish or other finish appearing on blackboard surfaces will be removed and the surface refinished (or new boards erected) by the Blackboard Contractor at this contractor's expense.

(B) Blackboard Specification

Note: The following clauses shall be included under the blackboard specification where and when they apply.

(B1) Preliminary Work

(B1a) General—The following preliminary work is done under other contracts and is covered under the following specification divisions. Before the erection of blackboards, this contractor shall examine all preliminary work and shall report to the architect in writing any inaccuracies or variation from the specification requirements which will in any way deleteriously affect work under this contract. Failure to so report defects, etc., if any, is construed as acceptance of the work as executed and release of those responsible.

(B1b) Carpentry Work—(Here refer to paragraphs under this heading of preliminary work affecting this contract).

(B1c) Lathing and Plastering—(Here refer to paragraphs under this heading of preliminary work affecting this contract).

(B1d) Painting—(Here refer to paragraphs under this heading of preliminary work affecting this contract).

(B2) Diagrams and Cutting Schedules

(B2a) This contractor shall furnish to the architect, in triplicate, for his approval, cutting diagrams and cutting schedules showing disposition of joints and blackboard and tack or bulletin board sizes for the various rooms distinctly and accurately allocated.

(B2b) All blackboard shall be accurately cut by the manufacturer at the factory to sizes conforming with the diagrams and cutting schedules.

Note: The E. W. A. ROWLES Co. will cut all blackboards to special size at the factory. A small cutting charge is made covering the extra cost entailed. All waste in cutting is charged to the customer at the regular price. Waste is reduced to the minimum by cutting from the nearest standard length to the dimension required.

(B3) Materials

(B3a) Blackboards—Blackboards shall be [Endurac] [Permaroc] [Duroplate] as manufactured by E. W. A. ROWLES Co., 2345 South LaSalle Street, Chicago, Illinois, or equivalent meeting fully this manufacturer's standards of quality as described in detail in their catalogue contained in the twenty-fifth edition of SWEET'S ARCHITECTURAL CATALOGUES.

All blackboards shall have surfaces perfectly true and smooth, free of defects and from depressions or projecting particles. Joint edges shall be sharp and make angles of 90 degrees with top or hanging edge. The bottom edge shall be parallel with the top edge.

(B3b) Cement—Cement for spot cementing shall be Rowles Blackboard cement.

Note: Omit if Duroplate is specified.

(B3c) Metal Clinchers—Metal clinchers shall be as manufactured by E. W. A. ROWLES Co.

Note: Omit if Endurac or Permaroc are specified.

(B3d) Metal Blackboard Joints—Blackboard joints shall be made with Rowles Zinc Metal Joints, dull black finish. All joint mouldings shall be without surface defects, smooth and straight.

Note: Omit if butted cement joint is specified for Endurac or Permaroc. Always include with Duroplate.

(B3e) Tack Board—All tack and bulletin boards shall be Rowles Cork Tack Boards.

(B4) Sizes and Lengths

(B4a) Widths—All blackboard widths (height from chalk rail to top) shall be as designated on the detail drawings and schedules.

(B4b) Lengths—All sections up to 6, 7 or 8 ft. shall be in one piece; all sections over 8 ft. and up to 16 ft. shall be in two pieces; longer sections shall be in multiples of 6, 7 or 8 or fractions thereof, but arranged with joints symmetrically spaced and with no piece for filling out less than 3 ft. in its horizontal dimension.

(B5) Storing

All blackboard material shall be properly stored at the building site in such manner as to adequately protect it from damage.

(B6) Uncrating and Distributing

(B6a) All material which is to be set by the Carpentry Contractor shall be shipped in separate crates and delivered to him crated as received from the manufacturer.

(B6b) All material to be erected by this contractor shall be uncrated in accordance with the manufacturer's directions. Distribute the material to the rooms and to the spaces in each room in their order, as indicated on the crates and sections to conform with the cutting diagrams and schedules.

(B7) Sizing

On outside walls, not furred and not dampproofed back of plaster, thoroughly size the plaster surface back of blackboards with glue sizing.

Note: Wherever dampness is apparent or possible, sizing is advisable—otherwise the spotting cement may be affected.

(B8) Setting Blackboards

(B8a) The setting, leveling and cutting of blackboard installations shall be in accordance with the manufacturer's recommendations and their standard specifications.

(B8b) No blackboard shall be set until the final coat of finish has been applied and has dried on the blackboard woodwork trim (except loose tack mould).

(B8c) All blackboards shall be set so that all edges shall be adequately covered by the loose tack mould. The writing surfaces shall be plumb and in a true plane with $\frac{1}{4}$ -in. clearance on all sides.

Note: Clearance is necessary to allow for swelling of wood trim.

(B8d) Where nailing is required to secure or hang the blackboard sections use 4d wire nails placed approximately $\frac{3}{8}$ in. from the edge and not over 18 in. on centers driven through drilled holes in board. Boards showing splits at nailing points below the finishing tack mould will be rejected and must be replaced at this contractor's expense.

(B8e) [Enduraroc] [Permaroc] shall be hung on nails from the top edge only. The balance of the blackboard surface shall be secured to the wall with three horizontal rows of spot-cement with continuous strips of cement at all joints. Spot-cement shall be applied to the plaster in globules about half the size of an egg. The top and bottom rows shall be from 10 to 12 in. from the board edge and from 12 to 16 in. on centers horizontally. The spots of the middle horizontal row shall stagger centrally between the spots of the top and bottom rows. Sufficient cement shall be used at the joints to firmly bed these for a space of 1 in. on each side. The boards shall be firmly pressed in position over the cement and leveled plumb and true. Sufficient pressure shall be maintained for a period of from 5 to 7 days to assure thorough adhesion without springiness for the entire surface. Pressure shall be accomplished by wood cleats secured at top and bottom with wedges beneath, spaced in accordance with the manufacturer's directions, or otherwise as may be approved by him.

Note: Omit if Duroplate is specified.

(B8f) Duroplate shall be set as follows: Place horizontal rows of Rowles Duroplate Clinchers secured to each horizontal wood ground from 12 to 16 in. on centers (two rows are required on boards 3 ft. wide; three rows are required on boards 3½ and 4 ft. wide). First nail the blackboard at top edge allowing $\frac{1}{4}$ -in. clearance at trim. After the panel has been securely nailed along the upper edge, clinch each fastener by holding a padded block against the surface of the board and drive back

with a hammer. Allow $\frac{1}{4}$ -in. clearance at bottom trim. (Do not nail lower edge.) If more than one panel is required to fill the space, insert the metal joint before nailing the second panel in place.

Note: See A1d for clincher grounds.

Note: See B9a for metal joint.

Note: Omit if Enduraroc or Permaroc are specified.

(B8g) Tack mould shall be carefully and accurately braded in position by this contractor with firm, continuous contact at all edges and brads neatly set for puttingty.

(B9) Blackboard Joints

(B9a) Metal Blackboard Joints—All joints shall be made with Rowles Metal Joints. The moulding shall be the full width of the blackboard extending back of the tack mouldings which shall be neatly notched out over it at top and bottom. The moulding shall be shoved tight against the first board set and plumbed; shove the next section of board into the groove of the moulding as far as possible and level and plumb the board. Mouldings with surface imperfections or which are warped out of line shall not be used.

Note: The manufacturer advocates this joint on all blackboards. Metal joints should always be used on Duroplate.

(B9b) Cement Joints—All joints shall be butt joints in accordance with the manufacturer's standard detail. The joints shall be plumb and adjoining surfaces in a true plane, boards shoved tight and the joint well bedded in setting cement.

Note: Use only on Enduraroc or Permaroc. See B9a above.

Note: Omit if Duroplate is specified.

(B10) Tack and Bulletin Boards

Set all cork tack and bulletin boards in accordance with the manufacturer's directions. Where joints occur these shall be symmetrically spaced to correspond with blackboard joints and shall be covered with a thin strip of wood to match trim. Apply tack mouldings surrounding tack and bulletin boards as specified above for blackboards.

(B11) Final Cleaning

After the painter has applied the final coat of finish to the tack mould, this contractor shall do the final cleaning of all blackboard surfaces, charging the reasonable cost thereof to those responsible for any damage. All varnish spots or streaks shall be removed with steel wool; apply Rowles Blackboard Surfactant rubbed down with fine pumice and water, blending the spots with the rest of the board surface.

WEBER COSTELLO COMPANY

MANUFACTURERS OF

Sterling Lifelong Blackboard and Old Reliable Hyloplate Blackboard
CHICAGO HEIGHTS, ILL.

Products

Sterling Lifelong Blackboard—A laminated cement-asbestos body with an elastic five-coat built-up surface.

Its satisfactory performance in thousands of schools proves its durability and excellence.

Old Reliable Hyloplate—A recognized standard of wood fiber board. Laminated live spruce wood-pulp body with a durable built-up writing surface. Nearly 50,000,000 sq. ft. have been sold and are giving satisfactory service in the United States, Canada, and twenty-one other countries.

Metal Rustproof Joint—Holds two adjoining boards together in perfect alignment in the same plane. Is flat and neat in appearance and slated to match the blackboards.

Labor and material considered, it is more eco-

nomical than any other type of joint. It provides a perfect, permanent blackboard joint.

The Company

A company with nearly fifty years of blackboard building experience and ample resources. Warehouses and reliable representatives are located in every section of the United States and Canada and many foreign countries. Prompt service is assured.

Guarantee

Every product of WEBER COSTELLO COMPANY must perform to the complete satisfaction of the user. We recognize our responsibility to our customers and will immediately investigate and adjust any complaint, should one arise, without expense or inconvenience to the customer.

STERLING LIFELONG BLACKBOARD

Construction

Body—Cement, long fiber asbestos, and black coloring matter thoroughly and permanently combined by laminating process and subjected to pressure of 9000 tons per slab, producing an extremely hard blackboard body of uniform composition, thickness and color. Not a wall board, but a special blackboard body constructed from exclusive formulas. It is made water resisting and warpproof by the extraction of all excess moisture and the application of special waterproof coatings.

Surface—Five specially mixed distinct coats of blackboard surface, applied to the face with mechanical precision. Each coat, individually, is thoroughly dried and rubbed. The surface is extremely elastic and resilient. Sterling, manufactured with mechanical and manual exactness, is uniformly free from every imperfection, irregularity and blemish.

Dimensions, Color, etc.

Sizes—Uniformly $\frac{3}{8}$ in. thick, 6 ft. 1 in., 7 ft. 1 in. and 8 ft. 1 in. long, $3\frac{1}{2}$ and 4 ft. wide. (An extra inch in length is provided for filling odd sized spaces.)

Weight—2.4 lb. per sq. ft. crated.

Color—Black, does not fade, mottle or turn gray.

Joints

Weber Costello Metal Rustproof Joint is recommended as the best method of joining two surfaces in the same plane. Eliminates careful fitting of edges and thus simplifies installation. Protects edges at joint. Labor and time considered, this is the least expensive.

Distinct Advantages

Writing Surface—Uniformly perfect, hard, close grained,

intensely black. Sterling surfacer coatings are ground and mixed from exclusive formulas, each one carefully applied and thoroughly dried.

Each of the coatings serves a definite purpose in the building up of the fine velvety writing surface.

The abrasive qualities are such that only sufficient crayon is used to make a distinct mark. Crayon marks are easily erased and the surface will not wear the eraser excessively.

The black color of Sterling surface absolutely prevents light reflection. Specially treated to prevent the surface from filling up and wearing slick and glossy.

The surface is elastic and thus permanent. It never cracks, checks or peels.

Few Joints—Due to long stock lengths, the number of joints required in a given space is reduced to a minimum.

Strength—It is extremely tough and strong and sufficiently resilient to prevent damage in handling and transit.

Fireproof, Does Not Warp—The material is absolutely fireproof. It is made by the laminated process and especially for the manufacture of Sterling. Only long fibered asbestos, high grade portland cement and first quality oxide of iron are used. All excess moisture is extracted and each board is sealed against moisture so that it never warps or buckles.

Economically Installed—Installation is easily and quickly accomplished without expert labor, since all edges are straight and true and the material is of uniform thickness. It is easily cut to exact sizes with simple tools available everywhere. Detailed installation instructions furnished with each shipment.

Economically and Safely Shipped—Light in weight (2.4 lb. per sq. ft. crated) and unusually flexible and resilient, so that it is not easily broken in transit.

(B) BLACKBOARD SPECIFICATIONS

Note: The following clauses shall be included under the blackboard specification where and when they apply.

(B1) Preliminary Work

Before erection of blackboards, this Contractor shall examine all preliminary work and shall report to Architect in writing any inaccuracies or variation from specification requirements which will in any way deleteriously affect work under this contract. Failure to so report defects, etc., if any, is construed as acceptance of work as executed and release of those responsible.

(B2) Diagrams and Cutting Schedules

This Contractor shall furnish to the Architect, in triplicate for his approval the manufacturer's cutting diagrams and cutting schedules showing disposition of joints and blackboard sizes for the various rooms distinctly and accurately allocated.

(B3) Materials

(B3a) Blackboards—Blackboards shall be Sterling Life-

long Blackboards as manufactured by WEBER COSTELLO COMPANY, Chicago Heights, Illinois.

All blackboards shall have surfaces perfectly true and uniform, free of defects and from depressions or projecting particles. Joint edges shall be sharp and make angles of 90 degrees with top or hanging edge. The bottom edge shall be parallel with the top edge.

(B3b) Cement—Cement for spot cementing shall be W. C. Sterling Cement.

(B3c) Metal Blackboard Joints—Blackboard joints shall be made with W. C. Metal Rustproof Joints slated finish. All joint mouldings shall be without surface defects, smooth and straight.

(B4) Sizes and Lengths

(B4a) Widths—All blackboard widths (height from chalk rail to top) shall be as designated on the detail drawings and schedules.

(B4b) Lengths—All sections up to 6 ft. 1 in., 7 ft. 1 in. or 8 ft. 1 in., shall be in one piece; all sections over 8 ft. 1 in. and up to 16 ft. 2 in. shall be in two pieces; longer sections shall be in multiples of 6 ft. 1 in., 7 ft. 1 in. or 8 ft. 1 in., or fractions thereof, but arranged with joints symmetrically spaced and with no piece for filling out less than 3 ft. in its horizontal dimensions.

(B5) Storing

All blackboard material shall be properly stored at the building site in such manner as to adequately protect it from moisture or other damage.

(B6) Uncrating

All material which is to be set by the Carpentry Contractor shall be shipped in separate crates and delivered to him crated as received from the manufacturer.

(B7) Distributing Sections

Distribute the material to the rooms and to the spaces in each room in their order as indicated on the crates and sections to conform with the cutting diagrams and schedules.

(B8) Sizing

On outside walls, not furred and not dampproofed back of plaster, thoroughly size the plaster surface back of blackboards with glue sizing.

Note: Wherever dampness is apparent or possible sizing is advisable—otherwise the spot cementing may be affected.

(B9) Setting

(B9a) The setting, leveling and cutting of blackboard installations shall be in accordance with the manufacturer's recommendations and standard specifications, furnished with each shipment of blackboard.

(B9b) No blackboard shall be set until the final coat of finish has been applied and has dried on the blackboard wood-work trim (except loose tack mould).

(B9c) All blackboards shall be set by experienced mechanics so that all edges shall be adequately covered by the loose tack mould. The writing surfaces shall be plumb and in a true plane.

(B9d) Tack mould shall be carefully and accurately bradded in position by this Contractor with firm, continuous contact at all edges and brads neatly set for puttying.

(B10) Joints

Note: Insert the joint selected.

Metal Joint Moulding—All joints shall be made with Sterling Metal Rustproof Joints. The joint shall be the full width of the blackboard extending back of the tack mouldings which shall be neatly notched out over it at top and bottom. The joint shall be shoved tight against the first board set and plumbed; shove the next section of board into the groove of the moulding as far as possible and level and plumb the board. Joints with surface imperfections or which are warped out of line shall not be used.

(B11) Final Cleaning

(B11a) After the painter has applied the final coat of finish to the tack mould, this Contractor shall do the final cleaning of all blackboard surfaces, charging the reasonable cost thereof to those responsible for any damage. All varnish spots or streaks shall be removed with steel wool; apply W. C. Liquid Blackboard Surfer rubbed down with fine pumice and water, blending the spots with the rest of the board surface.

(B11b) Any mars or defects at butt joints shall be repaired as above.

(B12) Direction Plate

In each room fasten permanently where directed by the Architect, the metal plate, furnished by the blackboard manufacturer, bearing directions for breaking in and care of blackboard surface.

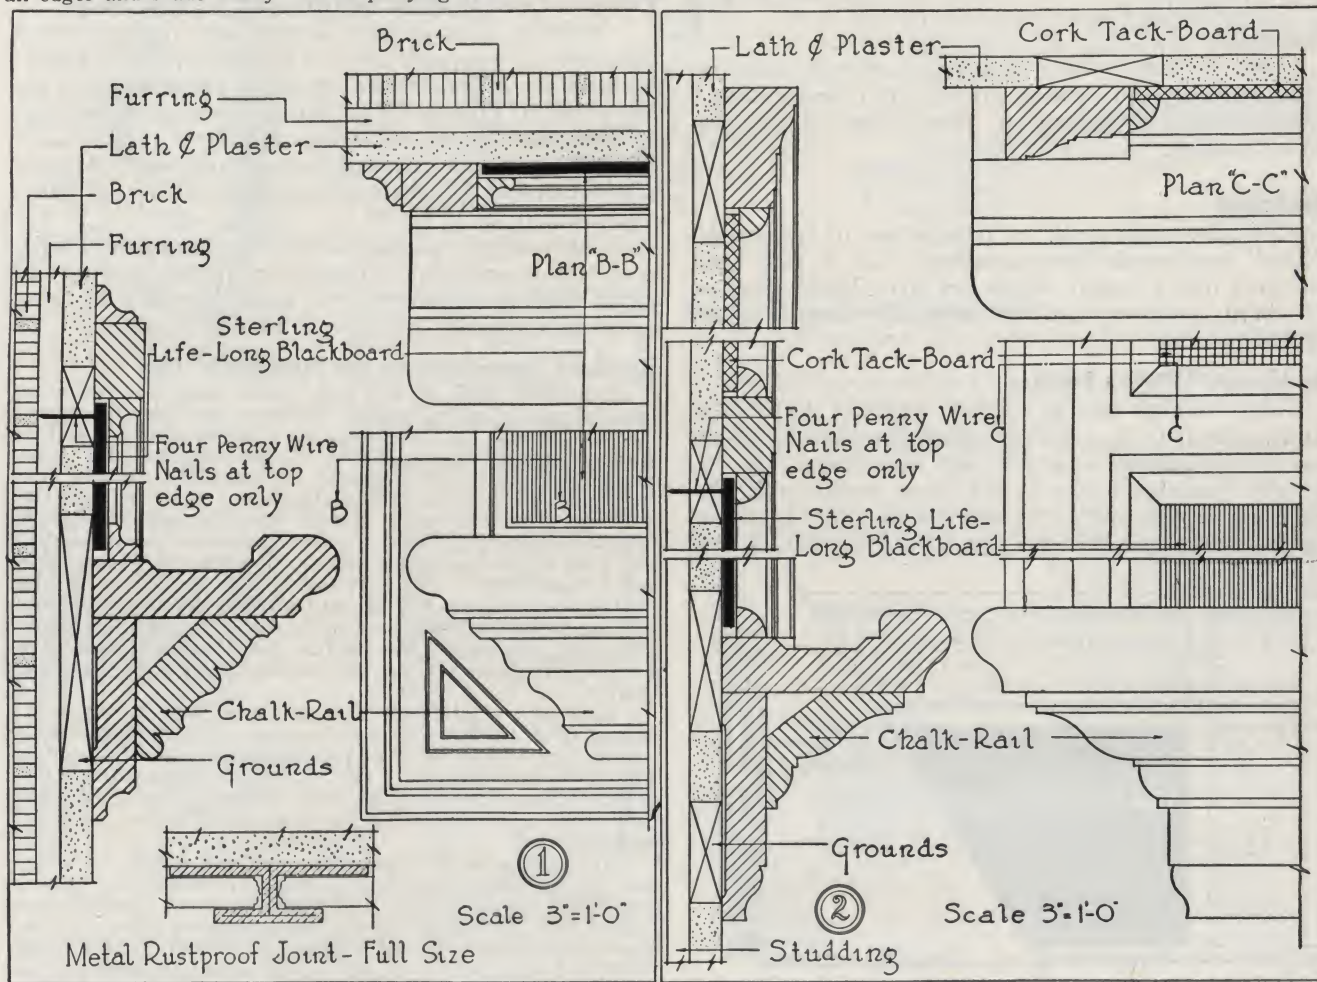

(B13) Breaking in Blackboard Surfaces

Note: Include where desirable. This Contractor shall break in all blackboard surfaces and leave in clean, perfect, ready-to-use condition as follows:

1—With the side of a piece of good quality crayon, chalk the entire surface of the blackboard. (Use only good grade crayon free from grease or grit. If the crayon is glazed or enameled it should be scraped off.)

2—Work the crayon into the surface slightly by erasing with a blackboard eraser. (No pressure is necessary.)

3—Erase with a clean eraser and follow with a soft cloth or a chamois skin.

THE VALLEYCO COMPANY, INC.

Manufacturers of Valleyco Certificate Blackboards,
Cork Bulletin Boards and Tacking Strips

116-118 E. Water Street
CINCINNATI, OHIO

Products:

VALLEYCO BLACKBOARDS:
CINOPLATE; CINOBESTOS; CINOBOARD
BULLETIN BOARDS; TACKING STRIPS

Management and Responsibility

The management of THE VALLEYCO COMPANY, INC., is vested in a group of men thor-

oughly experienced in the production and distribution of composition blackboards, and ever alert to anticipate the rapid changes of the era. The certificate of quality covering every purchase is supported by the company's established financial status and the known integrity of its personnel.

VALLEYCO CERTIFICATE BLACKBOARDS AND CORK BULLETIN BOARDS

Cinoplate

This is made with a foundation of board composed of pure wood fibres obtained by exploding fresh clean chips into a fibrous mass which is pressed into sheets of uniform thickness by means of tremendous hydraulic pressure and heat. Cinoplate is 100% pure wood; grainless and knotless; moisture-proof; contains no foreign substance. Cinoplate is certified not to warp or buckle and to withstand the moisture of freshly plastered walls and is especially adapted to withstand climatic conditions in localities where there may be a great deal of moisture.

Cinobestos

This is made with a foundation of long asbestos fibres and portland cement pressed into dense homogeneous sheets by lamination. Every sheet is uniform and is certified.

Cinoboard

This is made with a foundation of especially selected long wood fibres combined into a pulp and laminated into a board which lies flat. Each panel is kiln cured, water-proofed and especially treated by an original process.

Blackboard Writing Surface

The writing surface in all Valleyco Certificate Blackboards is of a rich black velvet appearance. Color is uniform, surface is smooth and nonporous. By the specially formulated process and secret method of application the writing surface is very elastic which prevents hairline cracks and checks. The writing surface is cer-

tified never to crack, check, chip or peel under ordinary conditions. Also certified not to gloss.

Sizes, Weights and Colors of Blackboards

Cinoplate—Green or black. Standard widths of 3 ft. 6 in.; and 4 ft. Lengths of 6, 7, 8, 10 and 12 ft.

Cinobestos—Black only. Standard widths 3 ft. 6 in.; and 4 ft. Lengths of 6, 7 and 8 ft.

Cinoboard—Black or green. Standard widths of 3 ft.; 3 ft. 6 in.; and 4 ft. Lengths of 6, 7, 8, 9, 10 and 12 ft.

Valleyco Cork Bulletin Boards and Tacking Strips

Valleyco Cork Bulletin Boards and Tacking Strips are made of best grade of cork sheets, especially manufactured for bulletin board, securely laminated with the best grade of glue to a 3-ply wood composition backing, or fibre backing if preferred, totaling a thickness of $\frac{1}{2}$ in. They can be furnished in any area desired; sizes larger than 4x6 ft. are made in sections. Over-all thickness standard at $\frac{1}{2}$ in.

These bulletin boards do not require plastered walls as all that is necessary is that the carpenter provide and install wood grounds and trim upon the walls the same as for blackboards. If desired, we will install.

Standard Specifications for Architects' Use

Contractor shall furnish and install ready for use in all spaces shown on plans, genuine Valleyco Certificate Blackboard as manufactured by THE VALLEYCO COMPANY, INC., 116 East Water Street, Cincinnati, Ohio. Blackboards shall be (Cinobestos) (Cinoplate) (Cinoboard) or equivalent, meeting fully the manufacturer's standard of quality as described in detail in SWEET'S ARCHITECTURAL CATALOGUES, Twenty-fifth Edition. All blackboards shall be of a width (indicate standard widths) and shall be set and joined strictly according to the manufacturer's instructions. All blackboards shall be set in position against wood grounds and all butting edges shall be cut smooth. Valleyco rustproof metal joining strips shall be used for making all joints. The installation shall be completed and executed as per the manufacturer's instructions furnished with the blackboard.

Contractor shall furnish and install all bulletin boards and tacking strips as shown on the drawings. All bulletin board and tacking strips shall be Valleyco quality as manufactured by THE VALLEYCO COMPANY, INC., 116 East Water Street, Cincinnati, Ohio. They shall be $\frac{1}{2}$ -in. thick, consisting of $\frac{1}{4}$ -in. cork sheet mounted upon 3-ply $\frac{1}{4}$ -in. wood compo (or fiber) backing.

The contractor for carpenter work will install the necessary wood grounds and frames ready to receive the bulletin boards and tacking strips. This contractor shall install in these frames the cork bulletin boards and tacking strips in the most approved manner, provided sufficient additional grounds at the joints and elsewhere to insure a satisfactory installation.

DUDFIELD MANUFACTURING CO.

Manufacturers of Patented Chalk Rails and Metal Blackboard Trim

116 West Kansas Street, LIBERTY, MO.

SALES REPRESENTATIVES IN MOST OF THE PRINCIPAL CITIES

Manufacturer for Pacific Coast States: EMIL BROWN & COMPANY, 300 East Ninth Street, Los Angeles, Cal.

Products

DUSTLESS ALL-METAL CRAYON TROUGH with Eraser Cleaner; METAL BLACKBOARD TRIM; SANITARY METAL BASE.

Also Chair Rail Wainscot Trim and Fittings.

Dustless All-metal Crayon Trough, Dust Trays and Eraser Cleaner

The main trough is made of one piece of No. 24 gauge special tight long terne plate in 8 and 10-ft. lengths. Cast metal ends and mitered corners are used, adding to its stability and making installation easy. Sections are butted together when installed, the ends being held in position by a concealed metal bracket at the joints.

Dust trays are made of No. 28 gauge

of No. 28 gauge "Cop-R-Loy" galvanized iron in 47-in. lengths for ease in cleaning. Eraser cleaner is made of No. 20 gauge galvanized iron. The slotted construction gives a scraping effect the full width of the cleaner and being smooth does not cut the erasers.

All units except the dust trays and eraser cleaner are given a priming coat of good quality gray paint at the factory.

Distinctive features are as follows:

Sanitary — Eliminates chalk dust from the room.

Time Saver—A slight rub on the screen keeps the eraser clean.

Fireproof—Made entirely of metal.

Artistic—Simplicity of construction enriches appearance.

Durable—Heavy gauge metal withstands hard usage.

Practical—Does not warp out of shape or away from the black-board.

**No. 350 Detail of All-metal
Trough, No. 400
Metal Trim**

Sectional Views of Dudfield Dustless Crayon Trough

Only metal parts are furnished by the manufacturer. Metal trough, metal trays and blackboard trim cut to exact lengths when ordered; give outside measurements of blackboards over all. When ordering, state whether blackboards are set flush with or on outside of plastered walls.

**Dudfield Dustless All-metal
Chalk Rail and Metal
Blackboard Trim**

Made of No. 20 gauge special long terne plate in 8 and 10-ft. lengths. No. 400 pattern is for use on blackboards set flush with walls; and pattern No. 400-A for blackboards set on outside of walls. The No. 400 pattern is usually preferred for the reason there is no ledge to catch dust. Corner caps and "T" fittings furnished. The No. 400 pattern can be used as a wainscot cap, also chair rail interior and exterior angles furnished. Primed at factory with a coat of good quality gray paint.

Official Endorsement and Samples

These products have been endorsed by State school superintendents, boards of health, architects, universities, colleges, sanitary and ventilating engineers.

Specifications for installation furnished on request. Write for samples, full size detail drawings and literature.

No. 51 Slotted Metal Eraser Cleaner
2 1/4 in. wide, 47 in. long. May be used as a chalk rail cover. Slots 1/4 in. wide, bars 1/8 in. wide

No. 351 Improved Dust Tray for Wood or Metal Troughs
wide, bars $\frac{1}{8}$ in. wide

Dudfield Sanitary Metal Base

No. 102 one-piece base for use with cement or composition floor.

No. 103 two-piece base for use with wooden floors. It has a metal cove attached to the floor which compensates for shrinking or settling of rough job flooring.

Finish flush with plaster walls. Construction permits grouting behind with cement which forms a rigid, sanitary and fire-proof job.

Nails and clips provide an easy and swift method for adjusting base and compensating for unevenness of rough walls. Can be installed in much less time than most other bases of this type.

Furnished 4 or 6 in. high and in No. 16, 18, or 20 gauge special long terne plate and given a priming coat of paint at factory.

Our metal cove may be purchased separately for use with wooden floors. A complete line of fittings are furnished.

Details of Dudfield's Sanitary Metal Base

ANDREW HOFFMAN MFG. CO.

310 South Michigan Avenue, CHICAGO, ILL.

The Ideal Map and Display Rail

Used in Schoolrooms, Offices, Conference Rooms, Hospitals

Purpose

The Andrew Hoffman display rail is applied to the walls on old or new trim at a convenient height, for

the purpose of hanging map cases, maps, charts, posters, bulletins, drawings, and things of a similar nature.

The Ideal Map and Display Rail

Used in Schoolrooms, Offices, Conference Rooms, Hospitals

Description

This display rail consists of a substantial steel rail of special channel section, in which slide hooks and clips. In schoolrooms, the rail is screwed to the trim at the top of the blackboards. In rooms without blackboards, it is screwed at a convenient height to trim, grounds, or directly to the wall. The screws, which we furnish, are closely spaced for maximum strength.

To provide for the most efficient hanging of various objects, there are two types of hooks: one of very strong one-piece bronze construction that will support the heaviest map cases without turning or twisting—furnished, one to each five feet of rail; and a lighter spring-steel combination hook and spring clip that supports lighter maps, charts, posters, bulletins, etc.—furnished, one to each one and one-half feet of rail.

Either hook may be removed from the rail by lifting it out through the slot. The bodies of the hooks are *inside* the rail; consequently the hooks slide freely without interference, and the appearance is neater. Additional hooks may be inserted through the slots.

Finish

The display rail is finished in standard brown to harmonize with the trim customarily used.

Advantages

This display rail is designed and built to give a lifetime of satisfactory and trouble-free service.

Thumb tacks and cork pads are eliminated by the use of the combination hook and spring clip. When the spring hook is lifted, the poster, etc., may be placed beneath, where it is held firmly, yet without injury, by spring pressure, which is, we believe, the only permanently satisfactory method.

The rail may be mortised or rabbeted in any position on the face of the trim or may be screwed to the surface. The rail should be mortised in a groove to attain the most attractive appearance. A mortised rail blends into the ensemble so completely as to be very inconspicuous. See optional positions in small drawing.

The sections of the rail are self-aligning, through the use of the dovetail joint, thus assuring the smooth passage of hooks and clips. Being firmly fastened with screws, the rail cannot pull loose.

It is extremely versatile in its use: the two different hooks provide for the display or hanging of anything from a sheet of paper to a map case weighing 100 lb.

Sizes

The display rail comes in sections 30 in. long. It is $\frac{7}{8}$ in. high and $\frac{1}{8}$ in. thick. If the rail is to be mortised, the mortise should be only $\frac{1}{4}$ in. deep to prevent the hooks from scratching the trim.

A. J. NYSTROM & CO.

Manufacturers of School Room Equipment

3333 Elston Avenue
CHICAGO, ILL.

THE NYCO CORK LINED DISPLAY RAIL

Advantages

The Nyco Cork Lined Display Rail saves the finish on walls and mouldings, and at the same time makes it easier to display anything before the class. With it a teacher has a cork strip for pins or thumbtacks, a spring clip to hold sheets of any size and a rail with sliding hooks for hanging maps and bulletin boards anywhere in the room—front, back or sides. It permits maps of varying lengths to be quickly mounted. The displaying of visual aid material and pupils' work is encouraged.

Without the rail it means the forcing of pins into woodwork or the inserting of screwhooks into mouldings or walls.

Description

The Nyco Cork Lined Display Rail, No. 90, is made of steel, electroplated and finished with lacquer which prevents tarnishing. The channel is inlaid with cork to receive pins and thumbtacks invaluable for displaying announcements, drawing, student's work, etc.

The rail is provided with sliding hooks for hanging maps of all widths, bulletin boards and other heavy items. See illustration.

Dimensions and Sizes

The Nyco Cork Lined Display Rail is a moulding of 18 gauge, cold rolled channel steel, in which there is a cork inlay $\frac{1}{4}$ in. thick. The width of the rail is 1 in. and of the cork inlay $\frac{5}{8}$ in. Attached to the wall by means of screws at $7\frac{1}{2}$ -in. intervals. Screwholes with brass countersunk collars are provided.

The display rail comes in 3, 4 and 6-ft. lengths. By placing the lengths end to end a continuous rail is formed to equip any size room. It can be attached to moulding or will serve in the place of the moulding.

Electroplated and lacquered in attractive brown, the rail is very neat and unobtrusive.

Rail Furnished without Cork, No. 91

The Nyco Display Rail is also furnished without cork inlay. The cost is less. With this rail, hooks with spring clips are provided. The spring clip is attached to the extension tab and conveniently holds any size sheet. See illustration at left.

PRICES

	No. 90 cork lined	No. 91 without cork inlay
Less than 500 ft., per ft.....	36¢	20¢
500 to 1000 ft., per ft.....	33¢	18¢
Over 1000 ft. per ft.....	30¢	16¢

Hooks, plain, for use with No. 90, 10¢.

Hooks, with clip, recommended for use with No. 91, 15¢.

Installation

On wood blackboard rails, both cork inlay and plain rail types are screwed in place. When metal is encountered, bolts are used. Screws and bolts are part of equipment.

MASTERS ALL-STEEL BLACKBOARD and BULLETIN BOARD FRAMES.

Description

Masters All-steel Blackboard Frames eliminate *all* the difficulties usually experienced with the use of ordinary blackboard frames. Their construction features are shown by the accompanying installation photograph and detail drawing.

Masters All-steel Blackboard Frames are built solidly into the wall. There is no possibility of anything coming loose, no risk of warping to throw boards out of alignment or cause cracks for the accumulation of dirt, no sinking under continued weight or pressure after years of service, no absorption of moisture.

Nearly all difficulties in the usual type of blackboard frame can be traced back to the foundation strip or ground, since it is almost impossible to fasten this securely enough to modern fireproof wall construction to carry the extreme weight placed upon it. Masters All-steel Frames use an 18 gauge cold rolled steel channel which acts as the plaster ground and blackboard frame and is bolted, toggled or screwed to the bare wall before plastering. The expense of resetting and reblocking of boards, commonly required every few years with other frames, is entirely obviated.

Masters All-steel Blackboard Frames are made entirely of steel. They are quickly and easily installed by any mechanic. They combine rigidity with strength. The steel clamps, shown in the detail drawing, permit perfect and permanent alignment of boards to an even surface.

Replacement of boards, should it be required, is made without difficulty. Waterproof cement may be used in the joints of boards instead of the solvent glue which must be employed with ordinary frames.

The perforated chalk tray of Masters All-steel Blackboard Frames does away with the old fashioned weekly cleaning of eraser dust. Once-a-year cleaning is sufficient, and this is quickly accomplished by vacuum cleaner or by unhooking the tray and emptying it.

Advantages

The features which make Masters All-steel Blackboard Frames superior to ordinary frames are: the ease of installation; permanence, life as long as the building; economy, absence of repairs and maintenance costs; sanitation; ease of access should replacement of boards be required; appearance which adds distinction to walls in which installed.

Sizes and Installation

Masters All-steel Blackboard Frames are made to accommodate boards of all dimensions and thicknesses. They work equally well with all types of blackboard material: slate, black

glass, or composition. The variations in thickness of slate blackboards are provided for by the clamps, shown in the detail drawing, which force the face of the board with a constant pressure against a straight bead. Thus the surface of a board $\frac{3}{8}$ in. thick will match perfectly with that of an adjoining board $\frac{1}{2}$ in. thick.

Finish and Cost

All concealed parts of these frames receive a baked prime coat. In specifying the architect should state the finish to be given the exposed surfaces. Any kind of finish can be applied and our method of construction at corner eliminates cut edges from showing.

The elimination of wood grounds in the Masters All-steel Blackboard Frames has placed their costs of installation on an equal basis with any good wood installation. Over long periods of service their economies reduce costs to a much lower level than that of wood frames.

Specifications

Architects will cover all necessary points of installation for blackboards if they include in their specifications the following:

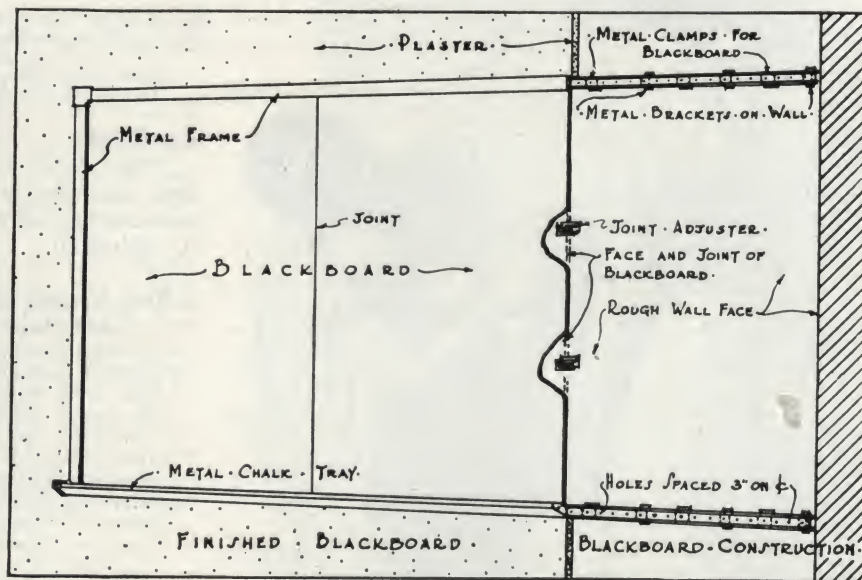

"Blackboards shall be installed in MASTERS ALL-STEEL BLACKBOARD FRAMES, Type ... (select type desired) with (or without) perforated chalk tray. Finish shall be ... (state finish desired). Frames shall be installed in accordance with the directions of the MASTERS STEEL FRAME COMPANY which will accompany all shipments."

GRIGOR-HEYMAN CORPORATION

Manufacturers of Coat Room Checking Systems and Equipment

OFFICES

Bryant Park Building, 55 West 42nd Street
NEW YORK, N. Y.

FACTORY: 510 West 25th Street, NEW YORK, N. Y.

Products

DE LUXE COAT ROOM CHECKING EQUIPMENT and SYSTEMS for convention halls, auditoriums, hotels, clubs, churches, community centers, institutions, schools, offices and factories; DE LUXE HOSPITAL and INSTITUTIONAL WARDROBE CHECKING SYSTEMS; SWIMMING POOL and SKATING RINK WARDROBE CHECKING SYSTEMS.

Also Theatre Dressing Room Racks, Make-up Tables and Shelving.

De Luxe Coat Room Checking Equipment

Constructed for durability, practicability and stability. Steel uprights of $1\frac{1}{2} \times 1\frac{1}{2}$ -in. No. 20 gauge square full welded. Cross members of angle full welded to tubing allowing shelf placement without shifting. Shelving made of seasoned wood sanded to a furniture-like finish, and constructed to form individual compartments for hats. White fibreloid number plates with black numbers, assuring visibility.

Brass deep weld hooks from which our special "Trueform" hanger is suspended with a double loop hook, one above and one below. The lower hook is used for checking umbrella and overshoe bags made of rubberized material. The hook and hat compartment numbered to correspond, checking four items on one check. This avoids confusion and speeds up checking in and out. The only equipment in case of overcrowding check room where two persons can be checked on one check if necessary, increasing capacity of a limited check room from 25% to 40%. Manufactured in three types: portable, wall and stationary floor racks.

De Luxe Swimming Pool and Skating Rink Checking System

All clothing on a hanger, shoes in a special compartment, underwear, shirts, etc., in a special compartment. This system eliminates individual lockers for

bathers, conserving space in this manner. Heretofore bathers were given an individual dressing room in which their clothing was kept as long as they remained. With the De Luxe Checking System thousands of bathers can use one dressing room and check their clothes with the attendant at the coat room, thus protecting the clothes against theft and receiving clothes in perfect condition.

De Luxe Portable Rack No. 1

Description of De Luxe Portable Rack No. 1

Standard length 6 ft. 3 in., height 6 ft. 6 in., width 2 ft., mounted on 3-in. "Perfect" ball bearing casters. Each rack accommodates 48 persons. Every coat on a hanger, every hat has its individual space. Can be dismantled or erected in a few minutes and a check room had in any part of the building desired.

Typical Check Room Showing Wall and Stationary De Luxe System

The illustration shows a typical check room consisting of both wall and stationary floor racks carrying the De Luxe Checking System of four persons per square foot of rack. The De Luxe Stationary Rack No. 1 carries the same principle as the De Luxe Portable Rack, with the exception that the casters are eliminated and the base fastened to the floor. De Luxe Stationary Rack No. 1 used only in permanent coat rooms.

De Luxe Wall Type Rack No. 1

Description of De Luxe Wall Type Rack No. 1

With this type of equipment every inch of space in a coat room is made available for checking purposes. The wall rack is fastened to the walls on sturdy wall brackets backed by a 3 in. x 1 in. cleat fastened with either rawl plugs, toggle bolts or expansion bolts, depending on the type of wall. Accommodating four persons per foot, every coat on a hanger, every hat in its individual space numbered to correspond with the hanger. It is also recommended for offices and factories where checking facilities for employees' clothes are limited as well as when planning permanent coat rooms for hotels, auditoriums, convention halls, clubs and so forth.

Hospital and Institution De Luxe Wardrobe Checking System

Patients' or inmates' clothes, first sterilized, are placed on hanger. These hangers are hung on a special hook inside of wardrobe bag. Bags are 4 in. wide, 50 in. long, 20 in. deep, allowing clothes plenty of space. Each bag has an identification check numbered. As patients

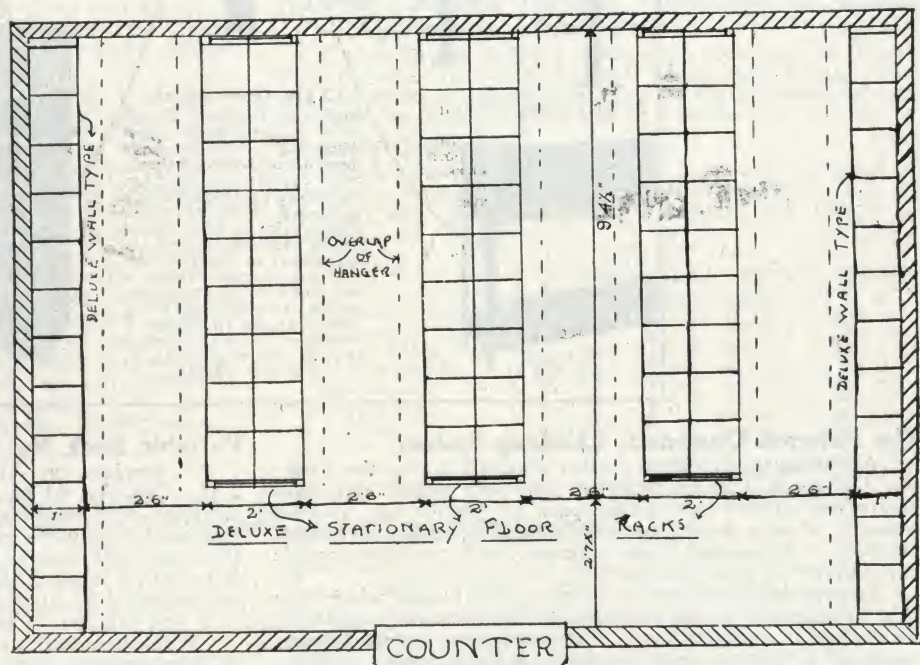

or inmates arrive, they are given a number which is tabulated on their receiving sheet and when discharged, their clothes are immediately available, eliminating all confusion and loss of time in searching for patients' wardrobe. The clothes are delivered to them in a presentable condition, instead of crushed and damaged as when they are put away wrapped in a bundle, and such bundles are generally lost or misplaced, causing a loss to patient or inmate.

De Luxe Wardrobe Checking System for Hospital and Institution

**De Luxe Umbrella Rack**

Manufactured in sections for 9, 12, 18, 27, 36 umbrellas

**Typical Layout for Coat Room**

Showing wall and stationary type, desired space necessary giving capacity for the architect's plans and specifications

VOGEL-PETERSON CO.

Manufacturers of Peterson Checkroom and Wardrobe Equipment
307 W. Randolph Street, CHICAGO, ILL.

Products

PETERSON ALL-STEEL CHECKROOM and WARDROBE EQUIPMENT for clubs, hotels, leagues, association buildings, auditoriums, theaters, museums, churches, schools, banks, stores, offices, hospitals, etc., consisting of Stationary and Portable Floor and Wall Racks; Overshoe, Umbrella and Baggage Racks; Racks for Bathhouse Checkrooms; a complete line of Closet Equipment and Costumers.

T. M. Reg. U. S. Pat. Office

Service

Our long experience in solving checkroom problems fits us to plan arrangements which will insure the greatest all-round efficiency. We will gladly submit to architects, gratis, blue prints indicating the most practical checkroom arrangements. Complete catalogue describing the Peterson system and equipment sent on request together with list of prominent installations.

PETERSON ALL-STEEL CHECKING EQUIPMENT

The Peterson One-check Checking System

Advantages—Unlike any other checking system the Peterson One-check Checking System increases speed, eliminates errors and utilizes any given space to provide the greatest capacity. Coats, hats, packages, umbrellas, canes, overshoes are taken care of quickly and accurately with the least possible expenditure of space or effort.

Operation—Each coat goes on its own hanger where it is held in shape; it is not subjected to the damaging results of sagging on an ordinary hook. Each hat has its correspondingly numbered section above the hanger. Canes, umbrellas, rubbers, overshoes or luggage are disposed of with equal care by means of systematically numbered umbrella, overshoe and baggage racks.

Regardless whether one or all of the above items are checked, it is only necessary for the guest or patron to be given one check which identifies every item.

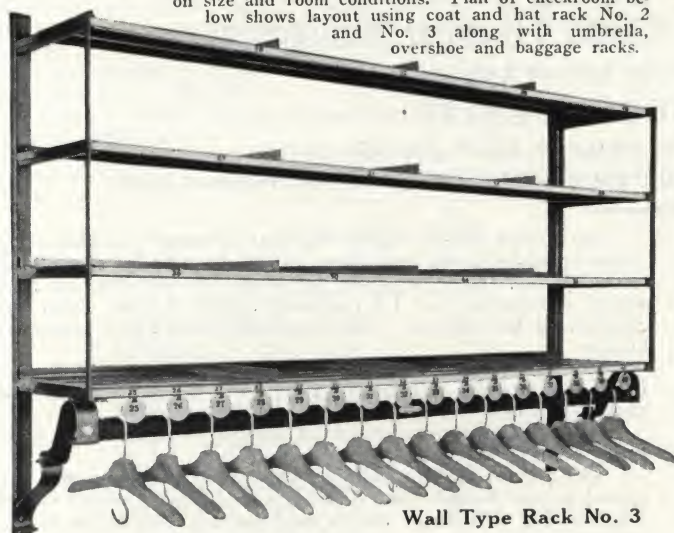

Only the Peterson One-check System offers this remarkable service.

Portable Rack No. 1

A standard unit—Length, 6 ft., height 6 ft. 7 in., width 2 ft. Capacity, 48 hangers and spaces for hats. Completely equipped with hangers, numbered shelves and guest checks imprinted with user's name. End frames are seamless tubular steel and all braces and shelves are electrically welded. Mounted on large, rubber, ball bearing casters. This rack can be assembled or knocked down without the aid of any tools in a few minutes. Can be stored in 2 sq. ft. of floor space.

With these racks a checkroom can be set up in any part of your building. It is easily moved from one location to another and will go through any ordinary doorway. This unit is very popular with users who find their permanent checkroom space too small or where no checkrooms are provided. The rigid construction and proper bracing in this unit prevents swaying. Standard finish: walnut-mahogany brown enamel. Wood panel end frames of special finish may be specified.

Note: Either one of these racks may be substituted for Rack No. 2 shown on preceding page or used in combination depending on size and room conditions. Plan of checkroom below shows layout using coat and hat rack No. 2 and No. 3 along with umbrella, overshoe and baggage racks.

Wall Type Rack No. 3

Stationary Floor Rack No. 2

Height, 6 ft. 7 in.; width, 2 ft., furnished in lengths 4 ft. and over. Capacity, 8 hangers and spaces for hats to every lineal foot of rack. Equipped with hangers, numbered shelves, guest checks imprinted with user's name, and all necessary hardware for installing. End frames are seamless tubular steel, and all braces and shelves are electrically welded. An installation of this unit with Wall Type Rack No. 3 gives the user the best permanent installation of checkroom equipment. Finish, walnut-mahogany brown enamel.

Note: Wood panel ends can be furnished with Rack No. 2 to match any woodwork.

Wall Type Rack No. 3

Extends 1 ft. from wall and installed at height to correspond with Stationary Rack No. 2. Furnished in any length, 3 ft. and over. Capacity, 4 hangers and spaces for hats to each 1 ft. length of rack. Brackets and shelves electrically welded. Furnished complete with hangers, numbered shelves, guest checks imprinted with user's name, and all necessary hardware for installing. This rack provides increased capacity in any room by utilizing the otherwise lost wall space. It is a very popular rack in the larger offices, providing a centralized wardrobe, and eliminating the use of bulky lockers. Finish, walnut-mahogany brown enamel.

Portable Wall Rack No. 9

A standard unit. Length, 6 ft.; height, 6 ft. 7 in.; width, 1 ft. 6 in. Capacity, 24 hangers and spaces for hats. Completely equipped with hangers, numbered shelves and guest checks imprinted with user's name. End frames are seamless tubular steel, and all braces and shelves are electrically welded. Mounted on large, rubber tired, ball bearing casters.

This rack can be assembled or knocked down without the aid of any tools in a few minutes. Moves easily from one location to another, and will go through the ordinary size doorway. The rigid construction and bracing prevents swaying. A very popular rack where space will not permit the use of a portable No. 1, or where a permanent installation of Wall Rack No. 3 cannot be made. With this unit, checkroom service can be set up quickly at the entrance to the dining room, coffee shop, or in barber shops, etc. Finish, walnut-mahogany brown enamel.

Umbrella Rack No. 4

Height, 36 in. to top of backboard; width, 1 ft.; furnished in lengths of 1 ft. 6 in. and up. Capacity, 16 umbrellas or canes to each 1 ft. length of rack. Equipped with guest checks imprinted with user's name. Drip pan has a pet cock for draining. This rack answers the question of what to do with wet umbrellas. Finish, walnut-mahogany brown enamel.

Overshoe Rack No. 7

Usually supplied in counter height, 15 in. deep, any width. Each compartment is 6x6x15 in. and accommodates one pair of rubbers or overshoes. Furnished in sizes to accommodate 24 pairs of overshoes and up. The question of handling wet and slushy overshoes is answered with this popular rack. It is sturdily constructed of heavy gauge steel, and handsomely enameled. Each compartment is numbered and numbered guest checks are also furnished. Finish, walnut-mahogany brown enamel.

Portable Floor Rack No. 1

Stationary Rack No. 2 is of the same construction as above but with uprights bolted to the floor instead of on rollers

Baggage Rack No. 6

Height, 84 in.; depth, 24 in. Furnished in 3-ft. sections, five shelves high, including top and bottom. Adjustable shelving, and with or without backs and sides. Capacity, 15 suitcases to each 3-ft. section. Finish, walnut-mahogany brown enamel.

Peterson Bathhouse Rack System

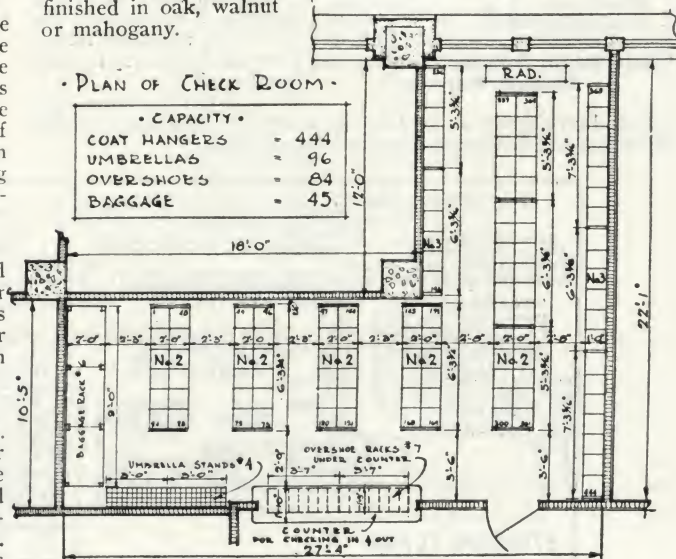

This equipment combines with the Peterson Checkroom Rack the convenience of a special hanger and bag to protect bather's apparel in the least possible space. It makes possible the handling of larger crowds and keeps the dressing rooms continually in use.

Peterson Garment Hanging Equipment for Hotels, Apartments, Clubs, etc.

This efficient equipment comprises a complete line of garment hangers for wardrobes—wall hooks, shelf hooks, extension and stationary closet rods. Complete information concerning these Peterson products will be furnished on request.

Peterson Costumers

These include various designs of costumers furnished in all-steel or wood construction. All-steel costumers may be furnished with umbrella attachment and drip pan. They are finished in oak, walnut or mahogany.

ALBATROSS STEEL FURNITURE CO., LTD.

Manufacturers of Highest Grade Hospital Equipment

GENERAL OFFICES AND PLANT

WEST LOS ANGELES, CALIF.

BRANCH OFFICES: SAN FRANCISCO and OAKLAND, CALIF., SEATTLE, WASH.

For Bathroom and Fire Hose Cabinets, and Steel Toilet and Shower Partitions, see Manufacturers' Index

Albatross Recessed Instrument Cabinets, Blanket and Solution Warmers, X-ray Viewing Cabinets

They meet the most exacting hospital requirements.

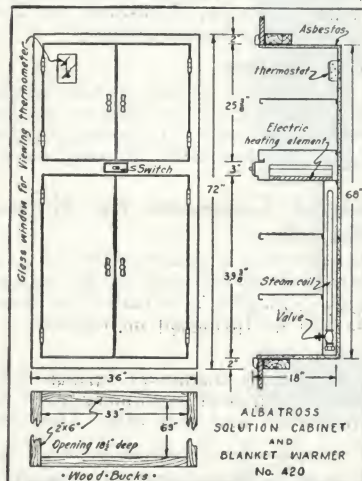

For 16 years this Company has been manufacturing this highly specialized line of quality products. Many of the newer institutions of the West are equipped with our product. Experience has developed models that are best suited for every hospital need. Special requirements will be supplied. Send plans and general outline of equipment needed. Our Engineering Department will submit sketches and estimates.

Solution and Blanket Warmer Data

Steam coil is of drawn copper tubing. Control valve supplied as shown. Steam traps are not included unless so specified. Asbestos covered walls. Perforated polished stainless steel shelves in solution section.

General Construction Specifications

(1) Steel sheets are of heavy gauge furniture steel,terne coated (lead coated) to resist corrosion.

Combination Solution Cabinet and Blanket Warmer

(2) Many bending and forming operations are combined in one sheet of steel to reduce number of joints and unsanitary crevices.

(3) The few necessary joints are welded and finished off smooth. Both electric and acetylene welded are employed.

(4) Hardware is correct in every detail. Hinges may be either of olive knuckle type as shown or of the butt type with plated barrel only showing. Handles are of plated cast brass. Locking devices bolt at three points. Paracentric locks of best standard makes are used and may be masterkeyed.

(5) Drawers are mounted on channel slides for easy operation even when loaded. The heads are double construction for strength.

(6) Doors are of hollow metal type, front and back each being stamped from one piece of steel, entirely eliminating mitred joints. Note carefully the detail drawing showing cork sound deadening and felt packing around glass. Also the reinforcing for rigidity. Albatross doors will never weave or buckle.

(7) Glass shelves are supplied with a bulb or rolled edge in front to prevent instruments rolling off. They are adjustable every 2 inches.

(8) A choice of 3 types of flanges is offered to meet every possible demand.

(9) Steam coils in blanket warmers are copper and are placed at rear to give even distribution of heat. Control valves are provided as shown. Steam traps are not included as standard equipment.

(10) Thermostats and electric heating elements in solution warmers are of our own design and are guaranteed to be foolproof. These are not stock products made for a variety of uses but were developed by us for this precise purpose. Temperature will not vary more than 2 degrees.

(11) Walls and doors of blanket and solution warmers are shown with asbestos insulation. They may be supplied without insulation if so specified.

(12) Finish consists of four coats of highest grade baked enamel of any color desired. Each coat is carefully sanded and baked before next coat is applied. Final coating on all exterior front surfaces is hand-rubbed with water and pumice to give smooth hard finish that is extremely tough and durable.

Blanket Warmer No. 427 Series

SIZES ALBATROSS BLANKET WARMER

No.	Width, in.	Height, in.	Depth, in.	Doors	Shelves
427	24	72	24	1	5
427A	24	72	18	1	5
427B	30	72	24	2	5
427C	30	72	18	2	5
427D	36	36	18	2	2

Note: Above dimensions as to width and height are clear inside of cabinet, not over all but the depth is over all. Buck openings should be 1 in. larger in each instance.

Construction Details

X-Ray Viewing Cabinet No. 428

For use in all surgeries and cystoscopic rooms. Flange is different than other cabinets shown in detail. It can only be recessed in two ways as shown in this drawing, i.e. overlapping plaster or tile or set flush before plastering. It may be fitted with side panels at extra cost, thus permitting it to hang on wall instead of recessing.

Case is double hinged permitting front to swing to any desired angle.

Four lamp sockets are provided (lamps not furnished). Inside and back is painted flat white to eliminate reflections.

X-Ray Viewing Cabinet

Instrument Cabinets

See general construction specifications.

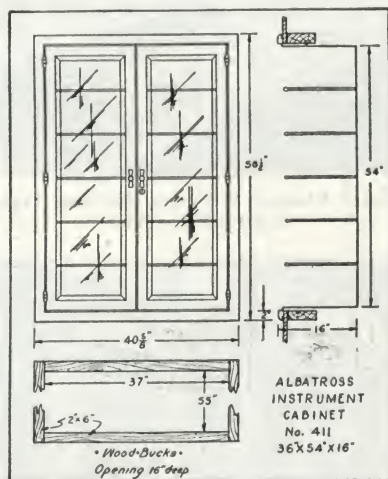

Note carefully:

(1) Cabinets with four doors have partitions in center dividing them into two complete cases of two doors each.

(2) Dimensions below as to width and height are clear inside of cabinet, not over all but the depth is over all. Buck openings to receive these cabinets should be 1 in. larger in each instance.

ART METAL CONSTRUCTION COMPANY

Hospital Equipment
JAMESTOWN, N. Y.

For Branch Offices, see Bank, Office and Library Equipment Section

For Sectional Metal Office Partition; for Hollow Metal Doors and Trim; for Bank, Office and Library Equipment, see Art Metal Construction Company in Manufacturers' Index

Art Metal Hospital Equipment, such as illustrated below, is growing in popularity because it has ably proved its worth from the standpoints of sanitation, adaptability and appearance.

We illustrate a few examples of Art Metal case work in the Hillman Hospital at Birmingham, Ala., Berlin & Swern, Architects; H. B. Wheelock, Associate Architect.

Following is a brief summary of the advantages of Art Metal Hospital Equipment:

(1) Flush, built-in construction providing bond with tile or plaster at all faces.

(2) Two-piece cabinet design permitting frames to be installed with the building walls.

(3) Finished cabinets to be held until building is broom clean.

(4) Assembly without visible attachments or joints.

(5) Sanitary inside cove construction.

(6) Elimination of dirt pockets.

(7) Facilities for cleaning and dusting.

(8) Acid resisting, baked enamel finish.

(9) No-bolt shelf adjustment.

(10) Nationwide Service Organization.

Blue prints and complete descriptions of our equipment for a completely and efficiently laid out darkroom supplied on request. The fact that we are familiar with modern hospital conditions and requirements make our recommendations of great value to the architect.

Children's Homeopathic Hospital, Philadelphia, Pa.

De Paul Hospital, St. Louis, Mo.

Doctors' Hospital, New York, N. Y.

Massachusetts General Hospital, Boston, Mass.

Scope of Service

We have made a special study of X-ray darkroom requirements. Our experience in designing and equipping should prove of value to architects.

SOME STANDARD EQUIPMENT

Thermonel Developing Tanks

Designed for controlling the temperature of the developing solutions. Built of tidewater cypress, insulated with 2 in. of block-cork, and lined with Monel metal. Manufactured in three standard sizes.

Special tanks built to order.

Buck Film Dryers

These have become a necessity to every X-ray darkroom. Not only hasten the drying of films, but promote order and efficiency. Manufactured in three models, both double and single. Special models of extra large size built to order.

In the Wall Model (I.W.) Opens Both Sides

Buck Transfer Cabinet

This cabinet mounted in the darkroom wall. For storing exposed and unexposed cassettes in a manner convenient to both darkroom and radiographic room. Saves many extra steps. Exterior of seasoned birch, lined with $\frac{1}{8}$ -in. sheet lead protected by galvanized iron. Automatic locks on doors. Nickel trimmings. Made in one size only.

Double Deck Side Opening Model (S.O.) Opens One Side Only

When designing the darkroom it is very important a free circulation of air be supplied to the film dryer by use of a maze entrance or ventilator of correct capacity. Damp air from the film dryer must be conducted from the darkroom.

Buck Darkroom Ventilator

The Buck Ventilator admits air to the darkroom without admitting light.

A necessity for supplying air to a film dryer as well as general darkroom ventilation. Size, 24x24x3 in. thick. Weight, 35 lbs. Supplies sufficient air for a single deck film dryer.

Buck Indirect Darkroom Ceiling Lamp

For general darkroom illumination. Delivers both ruby and white light. Has twin bowls of cast aluminum. Glass size of each bowl, 8x10 in. Enclosed wiring. All parts aluminum finish. Very substantial and practical. Made in one size only.

THE INTERNATIONAL NICKEL COMPANY, INC.

Monel Metal and Nickel and Allied Products

EXECUTIVE OFFICES

67 Wall Street
NEW YORK, N. Y.

MINES AND SMELTER: Copper Cliff, Ont., Canada
ROLLING MILL AND REFINERY: Huntington, W. Va.

REFINERY: Port Colborne, Ont., Canada
FOUNDRY: Bayonne, N. J.

For Our Other Products, see Manufacturers' Index

Products

MONEL METAL—available from stocks conveniently located throughout the country and made in all commercial forms required by manufacturers of hospital equipment. (See Manufacturers' Index, our section on Metals, for commercial forms and location of warehouses.) All necessary accessories, such as nuts, bolts, screws, rivets, etc., are also available.

Monel Metal

Monel Metal is a registered trade-mark applied to a technically controlled nickel-copper alloy of high nickel content. Monel Metal is mined, smelted, refined, rolled and marketed solely by International Nickel.

Advantages of Monel Metal for Hospital Equipment

- (1) Absolutely rustproof.
- (2) Resists corrosion by food juices, fruit acids and hospital solutions.
- (3) Strong as steel; tougher than steel.
- (4) Easy to clean; therefore sanitary.
- (5) Beautiful appearance; has color of platinum.
- (6) Durable — proven by over 20 years of service.
- (7) Easily fabricated.

Proven Uses of Monel Metal

Metal cabinets should be of all Monel Metal construction where extreme durability and appearance are important factors. Enameled steel construction also is used with the following parts of Monel Metal:

Counter tops	Trim
Shelving	Base kick-plates

For over 20 years Monel Metal has been used in food service and clinical equipment. Many installations have been in actual service for over 15 years, and are functioning perfectly. The Monel Metal page in the Food Service Equipment section contains a list of the

more prominent installations illustrative of the lifetime quality of Monel Metal equipment.

Services

Architects and engineers are invited to make use of the extensive advisory service maintained by this organization. A call to any of our sales offices, listed in our section on Metals, will bring you a Monel Metal specialist. In co-operation with kitchen

equipment engineers, Monel Metal specialists can contribute materially in the application of metals to hospital equipment.

Available Publications

To assist architects and engineers to form a clearer conception of the possibilities for the application of Monel Metal to built-in cabinets, THE INTERNATIONAL NICKEL COMPANY, INC., has prepared a series of reference folders and booklets, available on request:

"Architects' Handbook of Metal Cabinet Equipment"—A reference book prepared for the profession. Contains complete information on the design and construction of metal

cabinets, choice of materials of construction, and illustrations of correct method of writing specifications. Also contains catalogue pages of many manufacturers of cabinets.

"Built-in Cabinets"—A four-page folder illustrating specific applications of Monel Metal to cabinet construction and uses of cabinets.

"And the Greatest of These"—A series of illustrated folders on the uses of Monel Metal in The Medical Center, New York, N. Y.:

Utensils	Clinical Furniture
Cabinets	Laundry

"Modern Hospital Equipment"—Latest annual edition covering the use of Monel Metal in all departments of the hospital.

Metal Cabinet Specifications

Cabinets to be constructed throughout of No. 18 gauge No. 1 quality furniture steel.

All joints on face of cabinet to be mitered, acetylene-welded and ground flush and smooth, with no visible seams or joints on face of cabinet. All other joints to be electric spot-welded. The vertical stiles to be filled so as to make a hollow metal section. The bottom of all upper units to be filled so that bottoms are flush.

All doors and drawer fronts to be $\frac{5}{8}$ in. thick, hollow metal construction, and are to be recessed into frames so as to close flush with face of cabinet. All hollow doors to be reinforced with Z-bars.

Drawers to be equipped with channel suspension slides.

All shelves adjustable and removable, of No. 18 gauge steel, or glass, as indicated.

Glazed doors are to be constructed of one piece No. 18 gauge frame section, glass removable and secured by metal moulding, screwed in place on back of door.

Hinges are to be cast bronze, semi-concealed, French olive knuckle type, crodon-plated, with theftproof concealed pins. Hinges are to be mortised flush with edge of doors, which are to be reinforced at this point.

Knobs are to be cast bronze crodon-plated.

No screw or bolt heads are to be used on face of cabinet.

Base units with drawers 30 in. wide or smaller will be furnished with single width drawer. Where bases wider than 30 in. are used they will be furnished with two drawers with mullion between.

Counter tops are to be monel metal or linoleum as indicated.

Metal tops are to be constructed of .031 thick polished monel metal stretched over No. 16 gauge steel frame, frame to be reinforced with channel stiffeners 18 in. on centers. (Heavy gauge monel can be furnished where required.)

Linoleum tops are to be constructed of No. 16 gauge steel body upon which is to be cemented $\frac{1}{4}$ in. battleship linoleum, edges to be bound with No. 18 gauge polished monel metal edge mould rabbeted into linoleum so as to make a smooth flush surface.

All counters turned up 2 in. at back and at side where against walls. **Finish**—All concealed surfaces are to be primed with baked enamel before fabrication so that no metal surfaces are exposed to corrosion.

All exposed surfaces are to be finished with four coats best quality baked enamel carefully sanded between coats.

Locks where indicated are to be Yale 4-in. tumbler type. Single locks on drawers, and 3-point locks on doors. Locks are keyed and master keyed as desired.

DETAILS of CONSTRUCTION

PETERSON AND NEVILLE, INC.

Manufacturers of Pressed Steel Products for Hospitals
365 Dorchester Avenue, BOSTON, MASS.

Products

HOSPITAL TABLES, FURNITURE, SHELVEING and BLANKET WARMERS. For our pages on Pressed Steel Products: Metal Sinks, Steam Tables and Combination Door Frames, see Manufacturers' Index.

Hospital Equipment

We specialize in hospital equipment made to architects' designs, of stainless steel, monel metal and furniture steel, such as custom built surgeons' cabinets, tables, shelving and sinks.

Blanket Warmer and Hot Closet

The illustration at right shows front view of the blanket warmer and hot closet with shelves raised to show construction. Made for the Massachusetts General Hospital, Boston, Dr. Frederick A. Washburn, Director; Coolidge, Shepley, Bulfinch & Abbott, Architects, Boston.

This cabinet is built into and is flush with plastered wall, no dirt crevices. Size of this cabinet is 96 in. high, 42 in. wide and 36 in. deep, frame made of No. 12 gauge and body of No. 16 gauge steel. Door is of hollow metal construction made of No. 18 gauge furniture steel, patent-leveled, hung with a pair and a half of heavy mortised butts. Door is insulated with mineral wool of high-insulating efficiency. Shelving is No. 16 gauge furniture steel, with special rolled edges, perforated to permit circulation of air. Shelves are supported by verminproof supports tapped into cabinet wall.

These supports hold the shelves about $1\frac{1}{2}$ in. from the walls (see illustrations), which allows perfect circulation of air and prevents accumulation of dirt.

Blanket Warmer, Massachusetts General Hospital

This warmer is heated by a radiator equipped with hand control valves and automatic thermostatic discharge valve. Cabinet and shelving are painted in lacquer to match walls of corridor.

Note: All equipment for the Baker Memorial, Massachusetts General Hospital, was designed by Dr. Frederick A. Washburn who is recognized throughout the hospital world as an authority on hospital design and management. For that reason we have made up a set of photographs of our work in this building and will be pleased to send them to architects and directors of hospitals.

Surgeon's Instrument Case

Major operating room, Morrill Wyman House and Woollson Building, Cambridge Hospital, Cambridge, Mass.; Kendall Taylor & Co., Architects, Boston, Mass.

The illustration at left shows the front view of one of the surgeon's instrument cabinets at the Cambridge Hospital. This cabinet is approximately 84 in. high, 60 in. wide and 15 in. deep, made of No. 16 and No. 18 gauge patent leveled furniture steel. Doors are glazed with plate glass. Shelves are of plate glass with ground and beveled edges, supported by racks that permit shelves to be spaced at different levels. Cabinet is painted in lacquer finish to harmonize with walls of operating room. Hardware consists of heavy chromium-plated butts and paracentric locks, master keyed, provided with chromium-plated knobs. The doors of cabinets are of heavy hollow metal door construction that provide quiet closing and prevent any tinny metallic sounds. This cabinet sets into, and is flush with, the plastered wall allowing no crevices for the collection of dirt and vermin.

Surgeon's Instrument Case, Cambridge Hospital

ALBERENE STONE COMPANY

Alberene Stone Laboratory Equipment

153 West Twenty-third Street, NEW YORK, N. Y.

For Branch Offices, see our page on Stair Treads

Products

ALBERENE STONE, the natural quarried stone, is produced and fabricated for:

Laboratory Table Tops and Backs

Sinks and Drainboards

Fume Hoods and Ducts

Shelving, Cabinets and Peg Boards

Baths, Tanks and Vats

Flooring and Bases

Other miscellaneous Laboratory Equipment

For our page on Interior and Exterior Architectural Uses and Sanitary Equipment, Tubs and Kitchen Sinks, see Manufacturers' Index.

we believe to be without an equal. Our engineers are regularly invited to advise with chemical executives and architects on the planning of the laboratory layout for any work they may have. This service is rendered freely, and without cost or obligation.

We have been intimately associated with the latest developments in laboratory planning for over 25 years, and bring to you a knowledge of the best ideas used in the notable modern laboratories.

Let us send you a copy of the Alberene Laboratory Catalog.

Alberene Stone for Laboratory Equipment

In this field Alberene Stone is generally recognized as the *standard material*, as is evidenced by its general use and ever-increasing adoption by schools, colleges, hospitals, industrial plants, and the United States Government.

A natural stone, chemically inert and highly resistant to acids and alkalis, it is capable of being sawed, shaped and fabricated in any desired form without chipping or spalling. It is proof against wear, heat, moisture—in short, it has every desirable characteristic for laboratory service. Yet Alberene Stone equipment costs no more than substitutes which can only be partially satisfactory.

Advisory Service in Laboratory Design

Because of the importance of Alberene Stone in the planning of a laboratory we have, through years of specialized experience, acquired a fund of knowledge on laboratory design which

LOCAL REPRESENTATIVE

Service

Our Service Department is constantly in touch with architects and builders throughout the country, co-operating in working out special concealment and floor layout problems. The ideas secured through these contacts we offer to architects, contractors and builders without expense or obligation.

Features of Holmes Concealed Beds

These beds are unexcelled from the standpoint of construction, operation, comfort and design.

Construction

Holmes Beds have a standard one-piece head end which does not fold. They have fewer working parts, therefore their life and service are longer. The bed cannot jackknife nor can the head or foot ends collapse.

They are of special box spring construction and have full depth, retempered Premier steel wire coils.

Thousands of people throughout the country appreciate the cleanliness, comfort and convenience of Holmes Concealed Beds. They realize that they are sanitary, economical and reduce housework to a minimum. Holmes Beds are fast becoming the accepted bed for all sleeping accommodations and are serving

to make one room do the duty of two.

Minimum Floor Space Required

The Holmes Concealed Bed requires a minimum of floor space, regardless of the type of bed.

Easily Operated

"The easiest to operate" is a phrase that has come to be associated with Holmes Beds. They are so perfectly balanced that they can be raised or lowered with the slightest effort. Holmes Roller Beds ride on perfectly beveled $4\frac{1}{2}$ -in. rollers fitted with one set of roller bearings and two sets of thrust ball bearings.

Mattress Clamp

Mattress Clamps

Holmes Beds are equipped with two solid, non-breakable mattress clamps which hold the bedding and pillows firmly in place without slipping.

Designs and Finishes

In sizes and styles Holmes Beds meet every requirement and offer a price range to meet every condition. They are made in twin, single, three-quarter and full size.

Designs—Holmes created new beauty in concealed beds by making it possible to use wood head and foot ends, thus giving the beauty of period furniture in addition to economy and comfort.

Open ends have $1\frac{1}{2}$ -in. continuous square posts with seven or nine $\frac{1}{2} \times 1\frac{1}{2}$ -in. rectangular fillers; also with cane and solid steel panels.

Finishes—American walnut and mahogany finish on steel are standard. Durable enamel, baked-on in the proper degree of heat, can be furnished in all colors to suit the individual taste and harmonize with room furnishings.

Special Designs and Finishes—Twenty-three years' experience as exclusive concealed bed manufacturers and our new modern and enlarged plant place us in an exceptional position to fill special orders where exclusive designs and finishes are required.

Guaranteed Sleeping Comfort

Holmes Beds use full depth, double-deck, helical top coil springs, twice tempered in oil, the entire width and length of the bed. This insures a spring of greater softness, longer durability and maximum comfort.

The spring is clamped to a rigid steel frame with heavy cross members. The large coil springs are tied together with small steel wire, helical springs giving amazing flexibility and comfort.

A new and exclusive Holmes feature is the special construction of the spring and the treatment of the wire ends. These are bent in to eliminate the possibility of snagging the mattress or tearing the bed clothing or wearing apparel.

Holmes Box Springs are furnished when specified.

Standard Designs of Head and Foot Ends

Design A

Seven-filler head and foot end may be used with any Holmes Bed

Design B

Cane center panel design is an outstanding success. Used with any Holmes Bed

Design C

Steel panel design may be used with any Holmes Bed

Design D

Nine-filler ends make attractive design all in steel. Used with any Holmes Bed

Design W

Wood ends. May be used with any Holmes Bed

Holmes Roller Bed (Model 39)

The Holmes Roller Bed in all standard widths and sizes is complete with head and automatic foot ends and equipped with special highly resilient, full depth, double-deck coil springs—sanitary, verminproof, easily cleaned.

Holmes special bumpers are designed to safeguard against possible damage to furniture, walls or woodwork. Specially designed ball bearing, highly polished, perfectly beveled, 4 1/4-in.

hardwood maple rollers, which operate easily and smoothly, are used to prevent floors from being marred or the carpets and rugs from being damaged. Bed may be placed in any part of the room. This is especially convenient in summer when it is desirable to place the bed near the windows. This type of bed is also very desirable where a porch is used as a lounging place in the daytime and a sleeping place at night.

Hotels and clubs have found this bed most satisfactory, as it provides the guest with a living room during the day. As an auxiliary bed it effects a large saving in time and money as it can be easily rolled, ready for use, to the guest room requiring an extra bed.

An exclusive feature is the Holmes automatic lock which prevents the bed from jackknifing or folding over on top of the sleeping surface when the bed is down. The concealment of all mechanical parts makes this model a bed of distinction. There are no castings to break.

Stock size doors are used. If closet space is not available, we furnish canopy rods which are attached to the bed itself or to the wall, from which draperies can be hung that harmonize with the room furnishings and completely conceal the bed. Rods are furnished single or double, the double being used when a valance is desired.

Double Door—Closet Plans

Holmes Pivot Beds

Special Pivot Bed No. 63

In the new Holmes Special Pivot Bed No. 63 we offer a new adaptation of the patented pivot, the use of which gives an entirely new flexibility to the arrangement of closets for concealed beds.

The architect specifying this bed is greatly assisted in planning the bed closet arrangement because of the flexibility of this new pivot bed and the small amount of space required, as it operates in a recess type closet having an opening 5 ft. wide and a depth of 18 in. from inside of doors to baseboard.

The Special Holmes Pivot Bed No. 63 can be lowered as an ordinary recess bed.

Hardware for Pivot Beds

All hardware necessary for pivoting of beds furnished with beds. Hardware is always shipped separate from head and foot ends (except on Model No. 47), thus permitting all doors to be installed and finished before bed is attached. This may be done later by using six bolts.

Any carpenter can make the installation easily and quickly. Builder may use door or panels. Write us for other new methods.

Twin Pivot Beds (9-ft. Opening) Model 45

This installation is similar to the two-door pivot installation except that three doors are used. Side doors are pivoted at center and carry the beds. Center door is pivoted off center and gives access to closet at all times regardless of position of beds. Closet may be enlarged to form a dressing room. The opening is closed back of the sleeping surface, eliminating any direct draft over the head end.

Holmes Twin Pivot Beds occupy minimum closet space thus giving more room.

Dimensions and Operation Model 45 (9 Ft.)

Twin Pivot Beds (7-ft. Opening) Model 45

For opening of 7 ft., using three doors, one door is hinged to one of pivoting doors and revolves with it. This installation only needs 2 ft. 1 in. inside door, and requires but three 2-ft. 4-in. stock doors or panels. There is an overlap on either side of 8 in. from edge of door when beds are lowered into sleeping position, with a full 2-ft. 4-in. access between beds.

Two-Door Model 45

An exceptionally handsome and very popular model, requiring less closet and wall space than most pivot beds, thus reducing the amount of floor space with consequent reduction in building cost.

One of the doors is hinged and opens while the other pivots with the bed allowing it to be lowered into the room. Full access into the closet may be had through the hinged door when bed is lowered. This door may also be closed, completely closing the opening back of the bed when in use. The spread hides what little mechanism there is.

A steel standard, which carries the full weight of bed and pivoting door, eliminates the possibility of warping or twisting the door. With this construction French or mirror doors may be used. Regular mill stock doors are used. With the steel standard bar any thickness of door may be specified, without standard 1 3/4-in. doors are necessary.

Auxiliary legs are installed on all pivot models, with or without steel standards, taking all strain from door or standard, as the bed rests on four legs the same as any set-up bed. These auxiliary legs are automatically placed as bed is lowered into sleeping position.

An exclusive feature on all Holmes pivot beds is that they are easily adjusted without removing bed from opening, thus avoiding extra expense if building settles. Necessary hardware is furnished for installation of pivoting door. The only hardware the builder furnishes is hinges and lock for hinged door.

Center and Off Center Pivot Bed

We are in position to furnish center and off center pivot installation beds in any design and finish of head and foot ends.

Holmes Piv-A-Door Beds

In announcing the Piv-A-Door Bed No. 55, Holmes is now in position to fill the demand of the architect and builder for a single-door, pivot bed.

Holmes Piv-A-Door Bed No. 55 has fewer working parts than any similar bed on the market.

Note the sturdy construction of the one-piece head end which does not fold. Helical top coil springs are standard equipment on Holmes Piv-A-door Beds. The one-piece foot control rod automatically operates

Holmes Piv-A-Door Bed No. 55 in the Closet with a Single 3-ft. Door Open

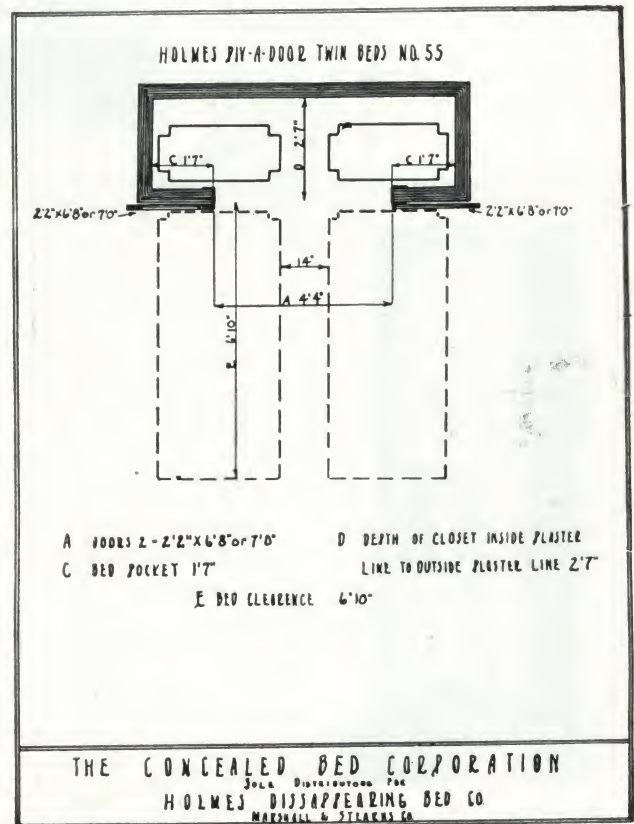

Holmes Piv-A-Door Bed No. 55 Fully Made with All Bedding Can be pivoted out or in the closet ready to be lowered into sleeping position

foot end as bed is lowered into sleeping position. Malleable mattress clamps securely hold all bedding and will not permit bedding to slip when bed is up-ended. The one main movable working part is on a 1/2-in. steel bolt. Special 1 1/2-in. square seamless welded tubing is used in head and foot end, fillers being 1/2x1 1/2-in. rectangular.

Height of door opening should be not less than 6 ft. 8 in. in the clear. Sleeping length of bed 6 ft. 4 in.

All types of CONCEALED BEDS, including Portable Closet (roller type), Recess (stationery and swingout), Jamb and Right Angle types, Pivotol Door Beds.

Also a complete line of Metal Beds, Bed Springs, Da-Beds, Hospital and Dormitory Beds.

The Company

In the twenty-one years since the head of our parent company introduced his first concealed bed, many important advancements in this field have

been contributed by our company. In the Midwest Line of Concealed Beds these worthwhile features are incorporated.

Concealed Beds

The Midwest Line of Concealed Beds measures up to the needs of present day building construction. We understand these requirements, and stand ready to render a service to all who are interested in superior equipment of this character. Catalogue and complete data furnished upon request.

MIDWEST JAMB TYPE CONCEALED BEDS

Installation No. 1

Beds can be pivoted to either right or left jamb as the occasion demands, provided there is sufficient pocket room.

Detail shows minimum dimensions to accommodate full sized bed.

Door width, 3 ft. Pocket clearance, 2 ft. 3 in. from face of jamb.

Depth of closet 3 ft. from inside plaster line to face of the door. Door clearance 3 ft. 2 in.

For

Three-quarter Size Bed—Door, 2 ft. 10 in.

Pocket clearance, 1 ft. 11 in.

Closet depth, 2 ft. 7 in.

For Twin Beds

—Door 2 ft. 8 in.

Pocket clearance, 1 ft. 7 in.

Closet depth, 2 ft. 7 in.

Opening widths allow a good clearance for passage of bed with doors opening full back or standing at right angle to the opening.

(Should there be sufficient wall space to allow door to open full back, width of opening may be reduced to

2 ft. 6 in. for Twin Size Beds.

Minimum height of opening, 6 ft. 8½ in.

Door height, 6 ft. 8 in. regular stock thickness.

Note: Minimum depth measurement is from inside plaster line to face of door based on the use of regular stock door thickness (1⅜ to 1¾ in.). For openings having doors of greater thickness add the average to minimum depth measurement.

Showing vertical strut of bracket assembly. Jamb type installation. Top guide only is attached to jamb, but carries no weight, and rotates bed around jamb with but slight effort

Illustrating ability of our rugged construction to withstand both torsion and direct strain, which insures against sagging of bed frame. Bed frame clears floor by approximately 2½ in.

MIDWEST PORTABLE CLOSET BEDS—ROLLER TYPE

A scientifically, all-steel-constructed bed designed to occupy a minimum of space, which, being free of all cumbersome mechanism, can be rolled from concealment to desired position in room with but slight effort.

Individual Features—Circular carriage or base construction (no sharp corners) only 20½ in. in width; all contact surfaces fully protected with felt buffer strip.

Exceptional Balance—Solely by tension springs (eliminating excessive weight existing in counterbalance types).

Automatically Controlled Center Swing Leg—A positive guarantee against jackknifing or folding over of head end when bed is in lowered position.

Ball Bearing Casters—Faultless ball bearing "rubberex" casters, 4-in. diameter, insure easy rolling.

Spring Frames—When raised or lowered, swings well within back line of carriage, insuring against defacement of walls or interior trim.

Bed Ends—Art line tubing 1½-in. diameter furnished in variety of designs and finishes.

Finishes—Standard finishes: wood brown and hand grained American walnut. Our hand grained wood finishes are beautiful reproduc-

Midwest Bed

Upright position, showing narrow base only 20½ in. wide

tions of natural woods. These artistic finishes represent the handwork of experts whose artistry lend the tonal qualities lacking in the average commercial wood finishes. We produce an unexcelled finish, both in appearance and durability.

Note: In quantities of ten beds or over we will match any special color scheme or wood finish to order at slight additional cost over standard or stock finishes.

We are in position to manufacture and design special patterns of beds made up according to your designs, provided the quantity is twenty-five or more beds.

Spring Equipment—Full size springs contain 108 coils of high tempered Premier wire with soft helical tied top. Ample depth of coils insures maximum comfort. Furnished in both single and double deck types.

Midwest Beds are unusually attractive and their durable, compact construction, reduced to a minimum of weight, makes them one of the most desirable of their class offered.

Full details of the complete Midwest line on application.

Products

All Types of DISAPPEARING BEDS, including Type "A" and "B" Pivot, Offset Pivot, Recess, Two-Door Pivot, Roller and Special Beds for extreme conditions.

For Murphy Cabranette Steel Kitchens, see Manufacturers' Index.

Bed Sizes

Standard sizes to take standard mattresses and operating through a 6 ft. 8 in. minimum height door.

Bed End Designs

Stock and custom built designs shown below, one and two-piece foot ends, continuous post of moulded "Graceline" tubing used throughout.

Castings

All castings of malleable iron.

Springs

Single and double-deck coil, flat fabric "Slumber King" and box springs. Helical tied.

Pivot Type Beds

Type "A" Pivot—The finest model of all concealed beds. Perfectly balanced at all angles. The head stands out from the wall and the folding head end holds the pillows snugly in place while the bed stands in the closet.

Type "B" Pivot—Has one-piece head end. Comes down close to door or wall, occupying a minimum of floor space. Multiple spring balance, sturdy construction and economical cost.

PRACTICAL APPLICATION—BED AND DOOR ON OPPOSITE JAMBS SO BED CAN BE DROPPED DOWN CLEAR OF WALL WITHOUT INTERFERENCE FROM DOOR

Installation No. 1

PRACTICAL APPLICATION—BED AND DOOR ON SAME JAMB, SO BED AND DOOR SWING CLEAR OF WINDOWS

Installation No. 2

Installation No. 4, Double Door

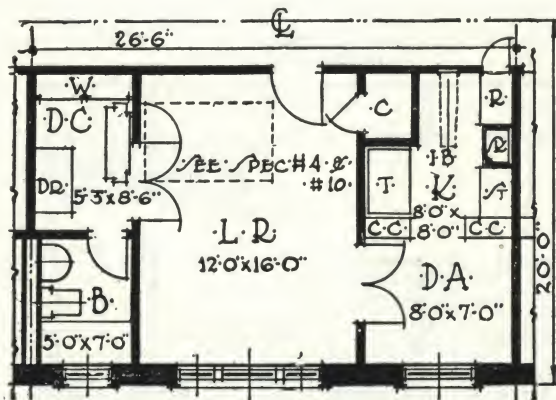

This installation is used where it is essential to have full entrance to and through the dressing closet to the bath or other room. (See floor plan below.) Bed independent of doors. Type "B" Pivot Open Filler, illustrated

INSTALLATION No. 4 DOUBLE DOOR

Minimum required dimensions for full size Murphy bed
4'6"x6'1" in dressing closet, where entry must necessarily be made
through bed opening

- | | | | |
|---------------------|--------------|-------------------------|------|
| A—Doors: width, two | 2'2" | E—Bed clearance | 7'6" |
| height | 6'8" or 7'0" | wall to foot end of bed | |
| C—Bed pocket | 2'4" | when lowered in room. | |
| | | I—Door clearance | 2'4" |

PRACTICAL APPLICATION—DOUBLE DOORS, WHERE ENTRY
MUST BE MADE THROUGH BED OPENING TO BATHROOM

Installation No. 4

Installation No. 7, Twin Murphy Beds, Both Beds Through Same Opening

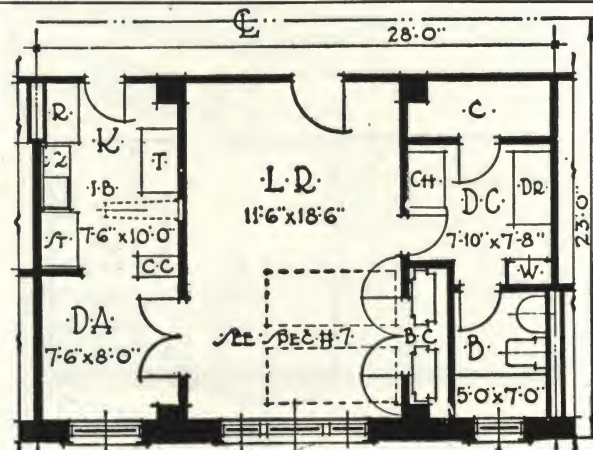

In-A-Dor type. Both beds through same opening. Beds independent of doors. Special Custom Design No. 17517, illustrated

TWIN MURPHY BEDS—BOTH THROUGH SAME OPENING

Minimum closet dimensions for Murphy pivot bed—twin arrangement for standard 3'0" beds.

- | | | | |
|-----------------------------|--------------|------------------|------------|
| A—Doors: width | 2'2" | E—Bed clearance | 7'6" |
| height | 6'8" or 7'0" | wall to foot | end of bed |
| C—Bed pocket | 1'7" | when lowered | in room. |
| D—Depth of closet | 2'7" | I—Door clearance | 2'4" |
| inside plaster line to out- | | Doors must | swing back |
| side plaster line. | | against wall. | |

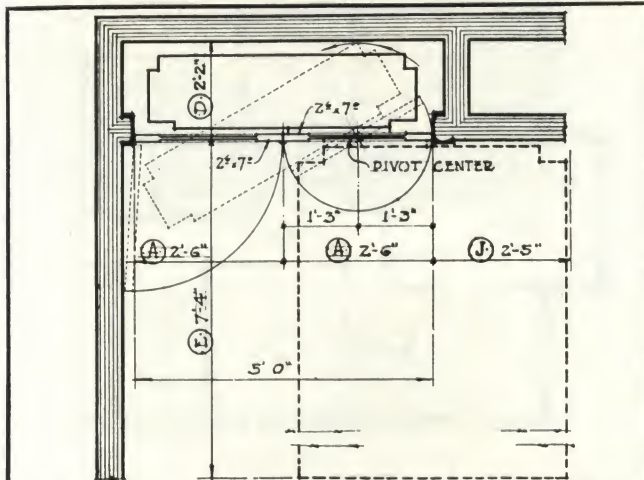

PRACTICAL APPLICATION

Installation No. 7

Installation No. 11A, Two-door Off Center Pivot

Requires two 2 ft. 6-in. doors, one hinged, the other center pivoted. Bed fastened to pivot door as shown. For access to closet through bed opening, bed must be pivoted into room as shown. Opening closed when bed is in room. $\frac{3}{4}$ Solid Panel, Special Finish, illustrated

DOUBLE DOOR OFF CENTER PIVOT INSTALLATION NO. 11A

Minimum closet dimensions for standard full size bed 4'6"x6'1" inside head and foot ends
 (A)—Doors: width, two 2'6" height 6'8" or 7'0"
 (D)—Depth of closet 2'2" outside face of door to plaster line in back of closet.
 (E)—Bed clearance 7'4" wall to foot of bed when lowered in room.
 (J)—Wall clearance 2'5"

PRACTICAL APPLICATION

The double door off center pivot installation allows bed to lower away from sidewall or window and closet opening

Installation No. 11A

Installation No. 13, Murphy Recess Type

Fastened to floor in shallow recess—lowers straight to floor, does not pivot. When on floor, ready for use, bed is projected forward so head end is in line with door opening.
 Note: When closet can not be provided, a canopy rod can be furnished which permits concealing bed behind draperies. Cane Panel, illustrated

MURPHY RECESS BED

Minimum closet dimensions for standard full size bed 4'6"x6'1" inside head and foot ends.
 For 4' bed, doors 2'3" wide; 3'6" bed, doors 2'0" wide; 3' bed, doors 1'9" wide.

A—Doors: width, two 2'6" height 6'8" or 7'0"
 D—Depth of closet 1'7" inside to outside plaster line.
 E—Bed clearance 7'4" back of closet to foot end of bed.

PRACTICAL APPLICATION—TO USE RECESS BED IN VERY SMALL CLOSET SPACE WITHOUT REDUCING SIZE OF SUN ROOM

Installation No. 13

Installation No. 14 Murphy Offset Pivot Bed

A pivot bed in a shallow closet that swings away from sidewall clear of furniture or entrance door.

Illustration shows "B" Type Pivot Bed, $\frac{3}{4}$ solid panel design with one-piece foot end. This type bed is also available in stock and custom designs with one or two-piece foot ends.

MURPHY "B" TYPE PIVOT

OFFSET PIVOT BED

Standard full size bed accommodating standard mattress. Bed can be pivoted to either right or left jamb.
 A—Doors (two) width
 Minimum height
 B—Depth of closet
 inside plaster to outside plaster

2'-6"
 6'-8" or 7'-0"
 1'-10"

PRACTICAL APPLICATION

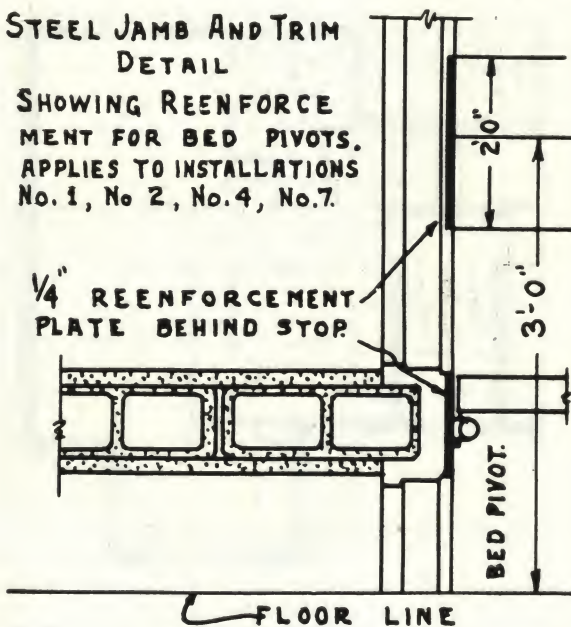

The offset pivot installation takes the bed entirely out of the recess and away from the side wall

SENG DUOFOLD CONCEALED BEDS

THE SENG COMPANY

1450 Dayton Street, CHICAGO, ILL.

Three Types, to Meet Every Need

For new or old buildings, without special construction. Average closet is large enough to accommodate them.

Save Half the Floor Space—Seng Duofold Beds are compact concealed beds for two. Roller and Pivot types take less than 5 sq. ft.; Recess type takes less than $3\frac{1}{2}$ sq. ft.; space saved makes larger rooms or added closets possible. In large apartments, an extra room or two is possible on each floor.

Duofold Roller
Bed Rolls
Easily

Quickly and Easily Installed—Duofold Beds come completely assembled. Only with Pivot type two brackets come loose for attaching to door-jamb. No springs or counterweights, no adjustments. No mechanical knowledge needed. No special construction required if closet for Pivot type already has a strong, solid door-jamb. Installation takes less than thirty minutes.

Safe and Easy to Operate—Duofold Beds are of steel: strength without weight. A woman or child can easily operate them. Balancing springs, not heavy counterweights, are used. Special device prevents beds closing when open for sleeping. In the Roller Bed the patented stabilizer keeps bed steady in all positions, preventing it from tipping forward or rolling away from the operator.

A Comfortable Bed for Two—Large enough for two people, and the famous sagless cable bedspring, with deeper action than average coil springs, will accommodate $3\frac{1}{2}$ -in. inner-spring mat-

tress and reasonable quantity of bedding. A child can sleep comfortably with a heavy person, because the spring will not slope toward the heavy person. This has been demonstrated frequently.

Sanitary, Easily Cleaned—The sagless cable, being flat, can be wiped off on both sides in a few minutes. No rough surfaces on metal parts; all smooth steel. Three types of bed ends are available. They provide variety in design as well as in price.

Maker Is an Old Concern—THE SENG COMPANY, maker of Duofold Beds, has held a high place in the furniture industry since 1874. The plant covers a full city block. They are one of the world's largest makers of furniture hardware specialties, and the originators and exclusive makers of the bed equipment used in Davenport Beds produced by leading furniture manufacturers.

Measurements and Space Requirements—The Seng Duofold Recess Bed folded takes less than $3\frac{1}{2}$ sq. ft.; opened 27 sq. ft. Closet depth needed is but 18 in. from inside of door. A 2-ft. 8-in. x 6-ft 8-in. door is recommended, although a 2-ft. 6-in. door can be used. The Duofold Pivot Bed, swinging back out of the way, is most often used in connection with a closet in which clothes are hung or in which dressing space is provided. And whether the bed is in the closet or out and opened, there is plenty of space for a person to get into the closet. The closet need be but 30 in. deep from inside of door and 44 in. wide, although usually made 60 in. or more in width to be available for other uses. When upright, the Duofold Roller Bed occupies only 31 in. x 23 in. When the closet is made for the bed to enter the narrow way a 2-ft. x 6-ft. 8-in. door is generally used, and the depth of the closet is 31 in. from the inside of the door. If made for the bed to enter the wide way a 2-ft. 8-in. x 6-ft. 8-in. door is used,

Duofold Pivot Bed
Shown in the Closet

Duofold Recess Bed

Duofold Recess Bed Closet
Measurement

Duofold Pivot Bed Closet Measurements

Duofold Roller Bed in Closet
the Narrow Way

Duofold Roller Bed in the
Closet the Wide Way

and the closet need be but 23 in. deep. If desired, doors 6 ft. 6 in. high can be used and the bed will still have ample clearance.

Weights—Average net weight of Pivot type (including brackets) 137 lbs.; shipping weight 185 lbs. Average net weight of Recess type 125 lbs.; shipping weight approximately 175 lbs. The average net weight of the Roller type is 135 lbs.; shipping weight about 185 lbs.

Three Types of Ends—Choice of three styles of (head and foot) ends: Grained Walnut with Burl Walnut Panel—No. 671 Roller, No. 681 Recess, No. 691 Pivot.

Grained Walnut Panel Ends: No. 672 Roller, No. 682 Recess, No. 692 Pivot.

Tubular Ends finished in Brown Enamel: No. 673 Roller, No. 683 Recess, No. 693 Pivot.

THE ARISTOCRAT—A DISTINGUISHED ROLLER BED MADE BY THE SENG COMPANY

The Aristocrat is designed for use in homes, hotels and apartments where the maximum of comfort is desired in a bed, and where convenience and quality and sightliness are regarded as essential.

Superlatively comfortable, because details of design and construction have been carefully worked out to make it so, The Aristocrat performs with distinguished excellence the first function of a bed—that of furnishing a place for restful sleep.

The coil bedspring in The Aristocrat is especially made, the coils being deeper and heavier than the ordinary, each coil electrically tempered, giving genuine resiliency with assurance that it is lasting. The bed-spring is handsomely finished with enamel, baked on.

Being a concealed bed, to be closed up by day, the next important function is that of safety. In this The Aristocrat offers several exclusive features. It is scientifically balanced by automatic stabilizers so that it will not tip when being lowered. When the bed is down it is positively locked; it cannot jack-knife. This is accomplished without heavy balancing counterweights, thus affording the required safety without the sacrifice of lightness and simplicity.

In appearance also, The Aristocrat is true to its name. Skillfully designed and nicely proportioned, it has sightliness as a distinct asset when open or closed. In this respect The Aristocrat departs from the common practice of giving the convenience of concealment at the expense of good appearance.

Contrary to the practice of omitting as much as possible in material, workmanship, styling and inspection, in order to make a cheap bed, The Aristocrat embodies every improved feature that sound engineering and good design could provide. It is a practical bed; in our judgment, the easiest to operate and the safest to use.

Instead of being content with the cheap angle-iron side rail, The Aristocrat has Seng Panel Rails at the

sides, shaped and proportioned exactly like the rails on the finest wood beds. These rails not only add materially to the finish and appearance of the bed, but they perform two very definite functions that add to the desirability of The Aristocrat: (1) they hide the maze of springs and the inside of the bed generally, and (2) they permit the tucking in at the sides of bedclothes. This last feature is important first because it aids in rendering the made-up bed more sightly, and second because when the bed is being raised or lowered, there are no moving masses of bedclothes hanging down over both sides.

The Aristocrat comes in two sizes: a double bed in the regulation 4-ft. 6-in. width, and a twin size in 3-ft. width. Each size may be had with a choice of two designs of ends as illustrated, one being a full panel and the other a center panel with fillers at each side. These ends are made with Graceline tubing. The finish on ends as well as panel side rails is in fine burl walnut with the natural grain. This finish is baked on.

The full size bed measures 76 1/4 in. high when closed, 78 1/2 in. long when opened. The carriage measures 58 1/2 in. wide overall, and is 23 in. deep. The twin bed measures 76 1/4 in. high when closed and 78 1/2 in. long when opened. The carriage of the twin bed measures 41 in. overall and is 23 in. deep. Thus both full and twin sizes are narrow enough when closed to pass through a 2-ft. doorway.

The full size bed with solid panel ends (No. 801) weighs about 195 lb. net, 275 lb. crated ready for shipment. The full size bed with panel-and-filler ends (No. 802) weighs about 185 lb. net, 265 lb. crated for shipment.

The twin size bed with full panel ends (No. 821) weighs 150 lb. net, 215 lb. crated for shipment. The twin size bed with panel-and-filler ends (No. 822) weighs 143 lb. net, 208 lb. crated for shipment.

Each bed is packed in individual crate. No assembling to be done on delivery. It is ready for instant use once the crate is opened and the bed rolled out.

Measurement details and suggested floor plans and closet arrangements will be gladly sent to architects or contractors on request.

THE "WHITE" DOOR BED COMPANY

Space Saving Beds and Other Conveniences

40 East 49th Street
NEW YORK, N. Y.

WESTERN SALES OFFICE: 130 North Wells Street, CHICAGO, ILL.

Floor plans, estimates and specifications will be gladly furnished. This service is given without fee or obligation.

Features of the New "Warwick" Sliding Door Bed

Sliding Doors at Right Conceal the Twin "Warwick" Disappearing Beds

Installation may be made adjacent to windows as there are no hinged doors to interfere with ventilation

A new type of installation, created exclusively for "Warwick" Beds. Simple in construction and operation. Permits complete concealment of beds when not in use; also, closes closet opening when beds are down.

Beds when in use are completely outside the wall line. Perfect ventilation is always maintained.

The sliding doors conceal the extremely simple bed mechanism which always remains within the recess,

thus giving the appearance of a beautiful stationary bed.

A pair of twin size beds may be installed in a closet 7 ft. wide, 19½ in. deep and 7 ft. high.

Doors operate on channel tracks. They fit very simply and harmoniously into almost any type of room, without being conspicuous.

Beds are of the "Warwick" standard, accurately balanced, beautifully finished, strong and serviceable. Coil springs are standard equipment.

As Attractive in Appearance As Stationary Beds

Note that the closet is closed behind the beds, the wall line is maintained, and there are no doors jutting out

furniture if accidentally bumped. No danger of collapsing.

The patented system of leverage, operating on hardened steel bearings, automatically advances the carriage from the head frame as the bed is being lowered, thus eliminating entirely the necessity of any heavy balance weights on the carriage.

Advantages of the "Warwick" Jamb-type Bed

The "Warwick" Jamb-type Bed affords the most modern design, the maximum of comfort and the highest degree of mechanical perfection obtainable in this type of disappearing bed. Above all else, it is a *real bed*—the equal of any stationary bed in luxury and appearance. In construction it is simple, sturdy and unfailingly dependable.

Ingenious New Operating Mechanism—The development of our own manufacturing engineers. Simple, efficient, durable. Distinctly superior in ease of operation.

Perfectly Balanced—Cannot "Jackknife"—Bed raises and lowers with the slightest effort and remains suspended at any angle. A clever mechanical feature removes any chance of "jackknifing."

Economical of Space—Requires small closet and also

takes less space in room when in use, for head end hugs close to wall.

Automatic Foot-end Device—Locks feet in position when bed is down in room.

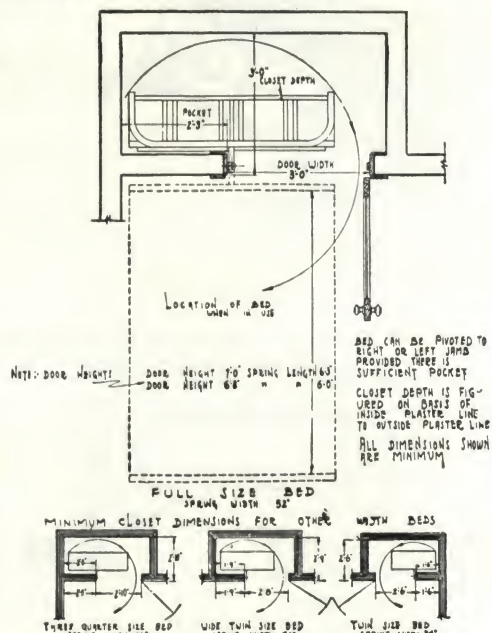

Perfect Resemblance to a Fine Stationary Bed—No unsightly superstructure on head end. Mechanical parts effectively concealed. Choice of six handsome designs and many finishes. May be had with box springs if desired.

Luxurious Comfort—High grade coil springs are standard equipment. Springs are same width as head and foot ends.

Easy and Inexpensive to Install—Nothing complicated. Complete hardware furnished. Closets use standard stock doors.

Fine Quality Construction Throughout—Made in our own factory and are the equal of the best stationary metal beds in every detail of structure and finish.

Many attractive installations are possible of which some of the most popular are shown in the plans below:

Advantages of the "Warwick" Pivot Door Bed

The pivot door type of disappearing bed installation has two outstanding advantages—(1) it affords perfect concealment of the closet while the bed is down in the room and (2) it permits access to the closet at all times, thus making it possible to use the closet for a private dressing room, usually with or adjoining bath. These two features are of great benefit in planning apartments and because of them, this style of installation has won a popularity with architects, owners and tenants alike.

THE "WHITE" DOOR BED COMPANY now present their newly developed line of "Warwick" Pivot Door Beds which brings new advantages both from a planning and mechanical standpoint. In construction, "Warwick" Pivot Door Beds are exactly the same as our jamb-type beds, except for the hanging device. They have the same clever new

raising and lowering mechanism, which, by means of the ingenious application of simple leverage, makes them operate with amazing ease and which is adjusted with such precision that the bed will remain balanced in any position.

The method of hanging the bed from the pivot door is an entirely new one devised by our engineers and has exclusive improvements over former types.

They have the exact appearance of high grade stationary beds for there are no unsightly superstructures or other mechanical parts visible, and there is a range of six handsome designs and many finishes to choose from. In comfort, too, Warwick Pivot Door Beds are the equal of regular beds, for luxurious coil springs are standard equipment, and box springs may be had if desired.

"Warwick" Model "A" Pivot Door Beds
8 ft. 6-in. twin installation

Warwick Pivot Door Beds give advantages in planning, too, and may be used in a large variety of arrangements all of which employ standard stock size doors of either 6 ft. 8 in. or 7 ft. high. Installation in the building is simple. We furnish complete hardware, including a ball bearing pivot plate which is adjustable to compensate for any settling in the building.

A few of the most popular closet arrangements are shown in the plans below. Our complete service sheets, which contain many other plans, as well as structural data, will be sent upon request.

"Warwick" Model "C" Pivot Door Bed
5-ft. full size installation

Closet Details for "Warwick" Pivot Door Bed Installations

Note: All doors are standard and may be either 6 ft. 8 in. or 7 ft. high.

Full Size Bed (5 ft.)

Uses 3-ft. and 2-ft. doors. Bed is hung on center pivoted door; narrow door hinged to jamb. Closet concealed by doors when bed is in use. Similar installations for three-quarter and twin size beds.

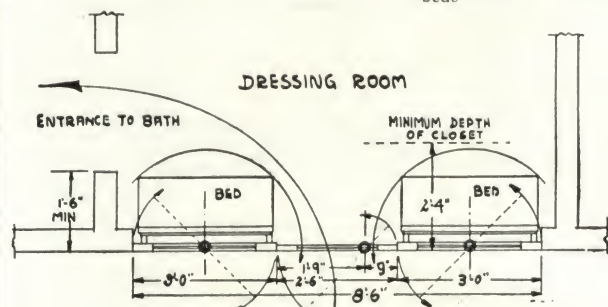

Full Size Bed (6 ft.)

Uses two 3-ft. doors, one center pivoted, the other hinged to jamb. Doors conceal closet when bed is in use but permit access thereto at all times. Similar installations for three-quarter and twin size beds.

Full Size Bed (7 ft.)

Uses three doors. Bed is hung on 3-ft. center pivoted door; other doors are 2 ft. wide, hinged to opposite jambs. Doors conceal closet when bed is in use. Bed closet may be used as dressing room in which case it should be minimum of 5 ft. 6 in. deep to provide space for "Warwick" Dressing Cabinet. Dimensions shown are minimum. Similar installations for three-quarter and twin size beds.

Twin Beds (8 ft. 6 in.)

Uses three doors. Beds are hung on 3-ft. center pivoted doors. Center door is 2 ft. 6 in. wide, pivoted off center. Doors conceal closet when bed is in use but permit access thereto at all times. If closet is used for dressing room, minimum depth should be 5 ft. 6 in. to provide space for dressing cabinet. Dimensions shown are minimum.

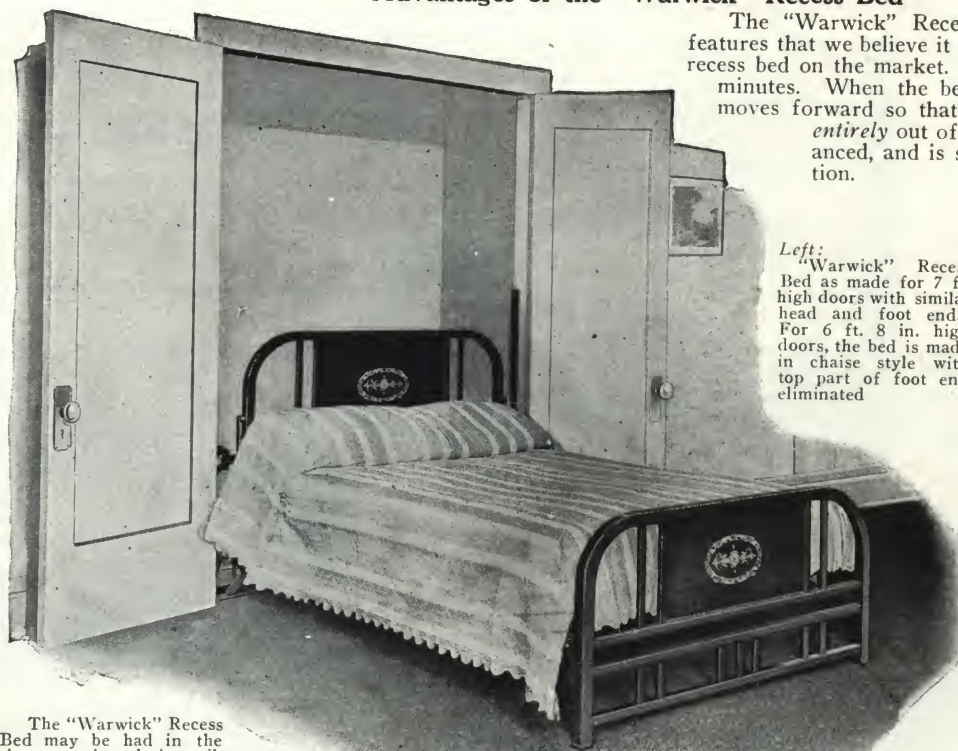

Twin Beds (8 ft.)

Similar to one at left except that bed doors are at one side. Beds are hung on 3-ft. center pivoted doors; entrance door is 2 ft. wide, hinged to jamb. Side door permits entry to closet, concealed when beds are in use. If closet is used for dressing room, minimum depth should be 5 ft. 6 in. to provide space for dressing cabinet. Dimensions shown are minimum.

Advantages of the "Warwick" Recess Bed

The "Warwick" Recess Bed has so many unusual features that we believe it to be the most highly perfected recess bed on the market. It can be installed in 10 to 15 minutes. When the bed is lowered, it automatically moves forward so that, when down, the head end is *entirely* out of the closet. It is perfectly balanced, and is simple and foolproof in operation.

The "Warwick" Recess Bed may be had in the six attractive designs illustrated on the fourth preceding page.

Left: "Warwick" Recess Bed as made for 7 ft. high doors with similar head and foot ends. For 6 ft. 8 in. high doors, the bed is made in chaise style with top part of foot end eliminated

Note that the bed comes entirely out of the closet

Bed is installed by merely screwing the two upright angles to back of door jamb

The "Warwick" Recess Bed Has Six Important Features

(1) **Head of Bed Comes Entirely Out of the Closet**—When the bed is brought down into sleeping position, the head of the bed automatically comes *entirely* out of the closet and remains in line with the door frame. This is accomplished by a special leverage arrangement. There are no wheels or tracks to get out of order.

(2) **Bed Is Very Simple and Easy to Install**—The bed can be installed in about 10 or 15 minutes. The bed rests on the floor but is not attached to it. To secure the bed, it is only necessary to attach the two upright angles to the back of the door jamb using a few small screws.

(3) **It Is Impossible for the Bed to "Jackknife"**—When the bed is lowered into sleeping position all spring tension is neutralized, so that even an extreme weight applied at the head end cannot accidentally raise the foot off the floor. The bed rests completely upon the floor without any strain on the door jamb.

(4) **Bed Will Remain Suspended at Any Angle**—The bed is so perfectly balanced that it will remain in any position in midair without closing up or dropping to the floor. Because of this balancing arrangement, the "Warwick" Recess Bed can be raised or lowered practically without effort.

(5) **Head Frame of Bed Holds Pillows in Position**—When the bed is raised, the head frame automatically forms a pocket which holds the pillows in place. The bed, therefore, can always be left ready for sleep with all bedding in normal position. The pillows cannot drop out when bed is in the closet.

(6) **Bed Locks Automatically in Upright Position**—When the bed is in the upright position a locking arrangement in the bed mechanism holds it securely against the wall of the closet. The bed cannot drop forward when the closet doors are opened, but it is automatically released when an actual effort is made to lower it.

Installation Details of "Warwick" Recess Beds

Full Size Bed

Minimum depth of closet is 1 ft. 4 in. measuring from back of trim to rear wall. Average width of opening is 5 ft. between door jambs. Width of each of two doors is 2 ft. 6 in. regular installation—2 ft. 5 in. in minimum installation. Height of doors may be either 6 ft. 8 in. or 7 ft.

Twin Size Bed

Minimum closet depth is 1 ft. 4 in. measuring from back of trim to rear wall. Opening should be 7 ft. 4 in. wide between door jambs. This may be reduced if necessary to a minimum width of 7 ft. 1 1/4 in. Width of each of two doors is 3 ft. 8 in. in regular installation—3 ft. 6 1/2 in. in minimum installation. Height of doors may be either 6 ft. 8 in. or 7 ft.

The "Warwick" Recess Bed rests on the floor of a shallow closet and is attached only to the back of the door jamb. It is provided with a mechanism which automatically moves the bed forward as it is being lowered, so that when down, the head of the bed is entirely out in the room.

For complete installation details use our service sheet No. 17A.

The "Warwick" Cuisinette—An Ingenious Kitchen Cabinet for Hotels, Clubs and Apartment Hotels

The "Cuisinette" will transform the one-room apartment or guest room, into a kitchenette apartment without the expense, trouble and disorder prevalent with remodeling. To provide complete facilities for preparing a light meal, or serving refreshments with ease, it is only necessary to move a "Cuisinette" into the room,

"Cuisinette" Provides Storage for Dishes, Glassware and Food and Includes a Complete Mechanical Refrigerator with Standard Type Compressor and Three Ice Cube Trays

connecting to the wall plug outlet for the operation of the "Warwick" Refrigerator. It is delivered complete, ready to operate.

This unique piece of hotel or apartment equipment enhances the value of the rental return to the management, as it makes the room so much more useful to the guest or tenant. In a short time it will pay for itself.

The illustrations show that the "Warwick" Cuisinette is not only a useful addition to a room but a decorative one. It has the appearance of a fine walnut secretary. When opened, it is a complete modern buffet kitchenette with convenience for preparing a breakfast, luncheon or light supper.

The compartment at top contains three shelves, 12 in. deep, 37 in. wide. Here can be kept the china and provisions. There are also two drawers for linen and cutlery.

The cooking compartment above the refrigerator, lined with heavy sheet asbestos, provides ample room for grill, toaster and percolator. The drop leaf that covers the cooking compartment when lowered, provides a table or working space 35 in. wide, 31½ in. deep.

A "Warwick" Refrigerator in the base section is part of every "Warwick" Cuisinette. The interior of the Refrigerator is finished in a lustrous white enamel. There are three trays each affording fifteen cubes of ice, and two compartments for safely preserving foods and beverages. And all this in a space of 41 in. wide, 20 in. deep, and 6 ft. 9 in. high. Finished in walnut.

The "Cuisinette" Gives the Appearance of a High Grade Secretary Desk

With a fine walnut finish it presents an appearance that will balance with the decorative scheme of practically any room

Unit A, "Warwick" Sectional Wardrobe

"Warwick" Sectional Wardrobes

New Built-in Units that increase efficiency of closet space and offer many attractive conveniences.

The ordinary closet is indifferently equipped and often inconvenient, especially as a place of storage for linens and small personal effects. These ingenious "Warwick" Sectional Wardrobes offer facilities for the keeping of clothing and belongings in an orderly and accessible way, much more convenient than heretofore — yet by their extreme compactness they make possible a very substantial saving in space. They will be found equally effective when used with disappearing bed installations or for regular closets, and their sectional unit design permits great flexibility as to application.

Built in two sections: Unit "A" is for the storage of suits or dresses, hats and shoes and Unit "B" provides drawers, trays and compartments for linens and other personal belongings.

Built according to the best standards of furniture construction, with paneled back and ends; finished in walnut and rubbed to a beautiful satin finish. Delivered completely assembled and ready for installation.

Each unit is 21¾ in. wide, 17½ in. deep and 6 ft. 6¾ in. high, and is designed to fit into a space 2 ft. wide and 1 ft. 8 in. deep.

May be set into an unfinished recess which need not be floored, plastered, wired or painted, and may be concealed by standard 2-ft. doors. A carpenter can install both units in recess in approximately one hour's time.

Unit B, "Warwick" Sectional Wardrobe

CURTIS COMPANIES SERVICE BUREAU

Manufacturers of Curtis Sectional Kitchen Units

CLINTON, IOWA

For Branch Offices and Display Rooms, and for Curtis Architectural Woodwork, see Manufacturers' Index

An Entirely New Idea for Modern Kitchens—Large and Small—Home and Apartment

New additions made in 1929 to the line of Curtis Woodwork include sectional kitchen units which enable the architect to design kitchens of beauty and convenience, and utilize every available inch of desirable work and storage space. There are 48 individual units—all interchangeable—affording a limitless arrangement of kitchen combinations for homes, apartments, hotels, schools, etc.

New Idea

Curtis introduced an entirely new idea in these sectional kitchen units. Now, instead of trying to crowd bulky ready-made dressers or combinations into the room, you simply select those units which will assemble into the most practical and beautiful combination for the space available. They fit together as snugly as drawers in a desk.

The kitchens shown here are good examples of the beauty and flexibility of Curtis Kitchen Units. All are made up of individual units grouped and arranged according to the available space and after the housewife's ideas. Note particularly the treatment of the corners where the right angle has been eliminated.

48 Individual Units

There are 48 individual Curtis Sectional Kitchen Units. These go together as easily and simply as a set of blocks. This feature lowers supervision and installation costs. All units are, of course, furnished in the white.

There is a utility unit or mid-section consisting of a utility drawer that tilts forward when opened, and sugar and flour bins that tip downward, making them easily refilled.

Construction

An entirely new type of construction is used in these Curtis Kitchen Units. Beveled edged three-ply panels, glued to correspondingly beveled edged rabbets in corner posts, from the sides and backs of the cases, providing a smooth flush outer surface. The corner posts and top and bottom rails are mortised and tenoned

CURTIS
TRADE-MARK

together and make an extremely rigid assembly. The inside corners of the corner posts are cut on an angle, eliminating square inside corners, which makes cleaning easy. All doors and drawers are of lip construction that lends itself admirably to two-tone finish.

All cases are built upon a definite mathematical basis to insure perfect interchangeability. The dimensions of units mentioned here are over-all.

The widths of cases are in multiples of 4 in. An extra 18-in. section is included which permits any wall space to be filled to the nearest 4 in. and in most cases to within 2 in. The heights of cases vary by multiples of 16 in. The actual heights are 16, 32, 48 and 64 in.

The counter tops are $23\frac{1}{2}$ in. wide, $1\frac{1}{8}$ in. thick, and when mounted on standard 32-in. base sections which stand on 2-in. toe strips, the counter top is $35\frac{1}{8}$ in. above the finished floor.

Over-all heights of installations will be 66, 82, 98, or 114 in. Various room heights may be accommodated by varying the toe strips and the width of cornice mould used to trim the top of the cases.

The units which are used below the counter top are 22 in. deep, all upper cases are 14 in. deep. Certain of the 22-in. deep cases may be used above the counter top if desired.

All units are made of pine and are shipped in cartons, set up, unfinished and without hardware.

Sliding table tops are furnished in solid birch and in pine, Formica veneered.

Extreme Flexibility

The flexibility of Curtis Sectional Kitchen Units is unlimited. For residential work—single houses or developments—apartment houses, country clubs, hotels, lodge buildings and churches which incorporate large kitchens; in fact, for any of your work which includes a kitchen, you have at your command, an entirely new idea for designing kitchens of unusual beauty and of still more unusual comfort and convenience.

5000 Model Kitchens—Yet No Two Alike

Curtis Kitchen Units are built in a wide variety of styles and sizes and all these units are reproduced in Miniature Kitchen Sets, making it possible to plan ideal arrangements in advance. (At least 5000 different "model kitchens" are possible.)

Architects are finding the Curtis Miniature Set (all Curtis dealers have one) an invaluable aid in planning for women the kind of kitchens they would design for themselves. Many are inviting women clients to express their own ideas in kitchen arrangement—as in the illustration below. Its as easy as playing with blocks to design just the kitchen desired

KITCHEN UNITS SCALE 1/4" = 1'-0"

Details of Curtis Sectional Kitchen Units

Here are details of 42 of the 48 Curtis Sectional Kitchen Units. Additional units not shown in details above include top section 16 in. wide; storage sections 8 and 16 in. wide; base pan section 16, 24 and 36 in. wide. From these it is easy to imagine the great flexibility these Curtis units offer, and how easily they may be assembled into any practical combination desired.

Installation

In assembling these units in combinations, the vertical joints are drawn together by means of $\frac{3}{16} \times 2\frac{1}{4}$ -in. bolts. All units are bored for these bolts in the front corner posts and also near the rear top and bottom rails. These holes are spaced to permit complete interchangeability. No bolt holes show on exposed ends. All front edges of corner posts are rounded to $\frac{5}{8}$ -in. radius so that when bolted together, the joint presents a neat finished appearance.

The Curtis Dresser Units are exceedingly flexible in their adaptation for use in connection with other items such as sinks, refrigerators, etc. Refrigerators can generally be accommodated as to width by one of various units offered; as to height, first horizon-

tal dividing line above a counter can generally be used. Installation costs are low.

Hardware

Exclusive hardware by Stanley is available for kitchen units. This is the finest obtainable and is of solid brass with genuine chromium finish, which is non-tarnishable.

Literature and Details

Literature and information on Curtis Kitchen Units will be sent upon request.

Details are included in the architect's details. Presentation drawings based on your plans, 1 in. to the foot and in color, will be prepared and sent you free.

One ideal arrangement of Curtis Kitchen Units. This kitchen was designed in miniature first so the housewife could see just what it would be like before a single step was taken in building

There is beauty as well as practical utility in the Curtis-equipped kitchen. This arrangement of units—first built in miniature on a library table—helped this housewife to realize her "dream kitchen"

CIRCLE A PRODUCTS CORPORATION

Manufacturers of Circle A Kitchen Units

654 South 25th Street, NEWCASTLE, IND.

NEW YORK, N. Y., Farmers' Loan and Trust Building, 475 Fifth Avenue

BRANCH OFFICES IN PRINCIPAL CITIES

Product

CIRCLE A KITCHEN UNITS, including Stoves, Refrigerators and Auxiliary Units to fit perfectly any size of floor and wall space.

For Sectional, Folding, Rolling Partitions and Circle A School Wardrobes, see Manufacturers' Index.

Kitchen Units

Circle A now offers a line of kitchen units that cannot be surpassed for quality of materials, excellence of design or wide choice of units. Approximately 90 units give the architect and builder a combination to meet every possible need, and to fit any and every kitchen, kitchenette or pantry.

No changes in the building need be made. All Circle A units are built with extreme accuracy so that each one fits to the next and the entire ensemble fits perfectly the given space.

One of the outstanding Circle A features is the one-piece porcelain table top, sink, and splasher. There are no cracks or joints to catch dirt or to cause rust. The entire top, in choice of colors, is of one solid, sanitary piece. Hardware of heavy brass is chromium plated over nickel to prevent rust or tarnish. Glasnob pulls stay bright and clean. Mortised and glued joints will not loosen. Other features offer maximum help towards more efficient kitchen activity and greater sanitation.

Architectural Service and Catalogue

An efficient architectural department is maintained to serve the architect, contractor and owner in the selection and arrangement of the proper equipment.

Offices in the principal cities are pleased to submit layouts and quotations, and also handle installation if desired. Highly skilled crews are maintained in every locality for this work.

Write for file size catalogue and data. K. U.-30.

Some of the 90 Various Styles and Sizes of Circle A Units
Butlery cabinets, pantry cabinets, kitchen cabinets, refrigerator cabinets, china closets, linen closets, wall cupboards, etc.

Choice of Colors

A range of six colors—green, gray, ivory, blue, orchid or white are offered in heavy, high grade enamel finish. All work is done at the plant. Each coat is sprayed on, and sandpapered between coats. A kitchen color scheme can be followed.

Material, Construction, Features

Only thoroughly seasoned, scientifically dry kilned hardwood is used. Shrinkage and warping are avoided. Panels are of three-ply laminated hardwood. Bread box, flour bin are of heavy, rustproof tin. All porcelain is of special 14 gauge steel with enamel in choice of colors. Refrigerators are of six-wall construction insulated with pure corkboard. Can be equipped for either ice or mechanical refrigeration.

General

Elgin, whose name is universally known for producing products of sheer quality, has completed the design of a new standardized, sectional system, enabling the most exact requirements to be realized, eliminating custom-made costliness.

Elgin Steel Kitchens interpret the true spirit of progressiveness—they definitely meet the exacting standards of the modern apartment and home design.

It is especially significant that with the harmony of line and color and true distinctiveness of design, precision construction, the Elgin Steel Kitchens have that finished artistry of appearance, that immaculate beauty that can only be the product of expert craftsmanship and materials of highest quality.

Specifications

All cabinet bodies are constructed throughout with No. 20 and 22 U. S. gauge full cold rolled, double pickled stretcher level No. 1 furniture steel.

All joints are electric spot-welded by Elgin special process, eliminating the weld marks.

All doors and drawer fronts are $\frac{1}{8}$ in. thick, drawn from 20 gauge annealed No. 1 furniture steel. All doors and drawer fronts are reinforced with 18 gauge channels, electric spot-welded to the inside of the door and drawer front panel. The inside of all doors and drawer fronts are enclosed with No. 22 gauge No. 1 furniture steel lining.

All drawers are equipped with dual-acting frictionless suspension slides and automatic stops.

All hinges are die-cut from No. 1 rustproof electric steel, cadmium plated, and buffed to a satin finish. All knobs are machine-turned from electric steel, cadmium plated, and buffed to a satin finish.

Finishes—All surfaces are thoroughly cleansed in oakite. All surfaces, including concealed surfaces, are primed with special lead-base, high-heat priming material. All exposed surfaces with the exception of door and drawer fronts are finished with cordovan enamel. All door and drawer fronts are finished with pyroxylin. Further, all door and drawer fronts are finished in white only with a stripe corresponding with any of the four standard body color combinations.

Standard Color Combinations

No. 1—Sea-green bodies, white doors with sea-green stripe.

No. 2—French-gray bodies, white doors with French-gray stripe.

No. 3—Holland-blue bodies, white doors with Holland-blue stripe.

No. 4—Sunset-tan bodies, white doors with sunset-tan stripe.

Products

MONEL METAL—available from stocks conveniently located throughout the country and made in all commercial forms required by manufacturers of built-in cabinets. (See Manufacturers' Index, our section on metals, for commercial forms and locations of warehouses.) All necessary accessories such as nuts, bolts, screws, rivets, etc., are also available.

consult manufacturers of built-in cabinets, as the gauge best suited depends upon the dimensions of the cabinet and the type of construction. For the type of finish on Monel Metal, specify Inco No. 8. (This finish closely resembles a buffed pewter.) If a higher reflective mirror finish is desired, specify Inco No. 5. The Inco No. 8 finish is recommended for general service as cleaning with abrasive compounds coupled with day to day use adds to the lustre of the original finish—it actually looks better after years of service than the day it was installed.

Monel Metal

Monel Metal is a registered trade-mark applied to a technically-controlled nickel-copper alloy of high nickel content. Monel Metal is mined, smelted, refined, rolled and marketed solely by International Nickel.

Advantages of Monel Metal for Working Tops on Built-in Cabinets

1. Beautiful, silvery appearance.
2. Smooth, hard surface, easy to clean.
3. Sanitary.
4. Rustproof.
5. Resistant to corrosion from food acids.
6. Strength of steel and resistance to denting.
7. Harmonizes with any color scheme.

Monel Metal is also widely used for pantry sinks, kitchen sinks, medicine cabinets, plate warmer linings, drawer linings, flour bins, laundry chutes, etc.

Instructions for Specifying Monel Metal

The words "Monel Metal" are sufficient to describe the material. For specification of gauge of material,

List of Manufacturers of Built-in Cabinets with Monel Metal Work Tops

The following manufacturers are in a position to furnish their cabinets with Monel Metal tops:

Janes & Kirtland, Excel Metal Cabinet Co., Olean Metal Cabinet Works, Inc., Rockford Steel Furniture Co., Zahner Manufacturing Co. and Wasmuth Endicott Co.

Consult their pages (see Manufacturers' Index) for details on cabinet construction. Names of additional manufacturers will be gladly furnished upon request.

JANES & KIRTLAND, INC.

Manufacturers of White House Line Patented Construction
Sectional Steel Units

MAIN OFFICE AND SHOWROOM

101 Park Avenue
NEW YORK, N. Y.

FACTORY, ST. CHARLES, ILL.

The White House Line

The equipment of the kitchen is now, more than ever before, a matter of first importance, whether in the home, the apartment, commercial and industrial building, hospital diet kitchen, or domestic science department. The use of steel for all cupboards, dressers, closets, etc., used in connection with the storing, preparing, or serving of food, is recognized as the utmost in equipment, and is rapidly replacing wood construction.

White House Steel Units, because of their construction and finish, fulfil the exacting requirements of sanitation, efficiency and durability.

The White House Line is manufactured in a unit system in a number of sizes and designs, the variety of which enables you to fill practically any space by combining units. The line comprises bases and upper units, regulation kitchen dressers, broom closets, side units for storage, sink units and tables. White House Units carry the approval of hundreds of satisfied customers over a period of 18 years.

Construction

White House Units are manufactured entirely of steel, electrically welded. Doors and drawer fronts are double construction, making them perfectly rigid. Openings for doors and drawers are made with our patented interlocking rabbetted construction on all sides, which gives a flush surface. The doors are hung on semi-concealed cast brass hinges (patented) and have friction catches and rubber bumpers, making it possible to open and shut each door independently, without noise.

Finish

The finish is white enamel of the highest quality; three-coat work throughout, each coat baked. This exclusive enameling process insures a finish which is very tough and durable and makes a highly polished surface, easily kept clean.

The WHITE HOUSE Line

TRADE MARK REG. U. S. PAT. OFF.

SECTIONAL UNIT STEEL DRESSERS

Combination of White House Steel Units

Takes the place of built-in wooden cupboards, and consists of a working dresser in the center, with a storage unit on the left and a broom closet on the right. Complete

Layouts are also furnished in color when desired.

Fittings

Knobs are of glass or chromium plated brass.

Hinges are cast brass, semiconcealed, chromium plated.

All shelves are steel and adjustable.

Legs are cast iron enameled, 6 in. high, equipped with domes of silence. All sub-bases are furnished by others.

The counter top of all bases, when set on 6-in. legs or on a 6-in. subbase, and with our 1½-in. counter, is 36 in. from the floor, making a very good working height.

We recommend monel metal for kitchen counters, and linoleum on steel with monel metal nosing for pantry use.

Arrangement

Arrangement of bases comprises cupboards and drawers, all drawers, shallow drawers lined with felt for silver, flour and sugar bins (50 lb. capacity), flour and sugar barrel compartments, towel driers, soiled linen bins, electric plate warmers and many other combinations.

Upper units may be equipped with flour bins and sifters (24½ lb. capacity), platter rails and cup-hook shelves. Rolling ladders may be furnished for reaching high units.

Monel metal pantry sinks are made to order to fit with our steel units.

Sizes

White House Units are furnished in the following widths: 14½, 16½, 18¾, 24, 26, 27½, 30, 36, 39 and 50½ in.

Every upper unit has a base unit corresponding in width. Upper units not made deeper than 14 in.

Base units can be made shallower than shown, with the exception of the bin base (minimum depth 16 in.). Plate warmer, and barrel base made only as detailed.

Installation

White House Units effect a saving in the cost of installation, especially where the walls are tiled. Each unit being a complete steel case makes it unnecessary to tile in back of the units.

Bases are set on our regular 6-in. legs, or more often are set on a composition base of 6 in. or less, made to take a facing of material to match the flooring.

Units are secured to the wall with bolts, etc., according to the construction of the walls: hollow tile walls, toggle bolts; brick wall, expansion bolts; lath and plaster wall, wood or lag screws in studding; gypsum block partitions, screws in wood grounds provided by builder.

Our service department makes a specialty of preparing estimates and suggested layouts of White House Units, on receipt of your floor plans.

White House Units are furnished complete, ready for use—no hardware, glazing or painting necessary.

Uses

Our patented construction and unit system make White House Steel Units adaptable for many uses, because they are not only sanitary and durable, but also fire-resisting, moistureproof, verminproof and odorless.

Residence, Apartment or House—In the kitchen, pantry, cook's pantry and general service wing.

STEEL IS STYLE any building, be it a fine home, exclusive apartment or in the hospital and institution field. Now, in one factory and its offices, we offer to architects, contractors and owners, the knowledge and experience of a force of men highly skilled in their line.

The engineering and layout of any operation where-in our standard line or special built work is used is offered by this superior force of men. Your problems of engineering may be trusted to them with the assurance that the data submitted will be authentic, accurate and complete. Efficiency in design and detail at the start precludes the possibility of errors of either omission or commission so easily possible.

FEATURES OF CONSTRUCTION OF OLEAN METAL CABINETS

A Distinctive New Line

In presenting this distinctive, entirely new line to the public for the first time, in catalogue, the makers and designers feel that a bit of salient information is in order.

Correct in every detail, all units have been designed with their ultimate use in mind. Olean cabinetry has true individuality, a quality not easily copied.

In finish too one finds the unexcelled duco process with its soft gloss both pleasing to the eye and distinctive in its texture. Easily cleaned, increasing in gloss with repeated rubbing—our finish process will delight the discriminating owner—giving long and lasting service.

On the page opposite we picture a section of upper and base units and have, from these, selected certain especially important details. These have been drawn in perspective and we would call attention to them as follows:

Panel or Glazed Door Construction

Detail "A" shows the construction of the panel or glazed door and its relation to the finished cabinet. Note the seamless tubing spotwelded to the one piece drawn moulding. The sides, top and bottom being mitred and acetylene welded to give an extremely rigid door, and can be fitted with either glass or steel panel. This section shows also the flush bottom cover plate, and illustrates in fine detail the narrow $\frac{7}{8}$ -in. frame of the case, a distinct advance in design.

Detailed Door Construction

Detail "B" illustrates again in more detail the door construction. Attention is invited to the oval knob, designed for appearance in connection with the finished whole, and for ease in operation, and lasting qualities. Drop forged from solid brass, chromium plated, these knobs will give permanent satisfaction.

Bottom and Back Plate Construction

The method of forming the bottom and attaching the back plate is shown at detail of section "C." The bottom is double with a cover plate forming the outside and the bottom plate forming the inside. The bottom plate is flanged downward all around and welded to the ends and back. At the front it is welded to the moulding forming the bottom edge of the cabinet and becomes a door stop. Adjustment holes are punched at each side of the back plate which is perfectly flat with no projecting points to catch dirt and cleaning cloths. The method of forming the side of the cabinet so that it leaves a recess behind the adjustment holes for the brackets is clearly shown.

Drawer Slide and Stop Construction

One of the finest achievements of our engineers is shown at detail of section "D" in the drawer slide and stop. Note in particular that the channel on the drawer is part thereof and as such serves the double purpose of added strength in the drawer body and as the channel member. This channel may be of stainless steel or monel metal, eliminating the wearing off of paint on the channel.

Our stopping device, sure in action and simple in construction, enables one to extend the drawer, fully loaded, without fear of the contents being dropped to the floor.

To remove the drawer for cleaning, pressure of the thumbs on the lever projecting through the channel is exerted and the drawer removed. Replacing merely means the simple operation of re-entering the body channel.

With this type of drawer channel it is impossible to misplace the channel members, insuring a free running drawer.

Narrow Margin

Detail "E" shows the narrow margin and special hinge developed for Olean Metal Cabinets.

In designing this new line of cabinets the fact that they are made of steel was kept constantly in mind with the result that they have a character all their own. Instead of the wide margin customary in wood construction for strength we have developed the long desired hollow style. The $\frac{7}{8}$ -in. margin has every advantage of narrow clean cut lines and the smart distinctive appearance obtainable only in fine metal work.

The interior of the cabinet is rectangular in form with no corners or recesses in which dirt can collect and which are hard to clean. Note how the shelf support is folded around to form part of and reinforce the door jamb and carried back to form a tight joint with the side thereby entirely closing the space behind the jamb. The shelf support slots are spaced $\frac{1}{2}$ in. on centers. The shelf bracket used is the standard Garden City type. Glass shelves may be substituted for steel if desired.

Semi-Concealed Hinges

The beautiful olive-shaped concealed pin hinge is shown in detail of section "E." This hinge, conceived by Olean engineers, is drop forged of solid brass, chromium plated. It is exquisite in line, sturdy in construction and very strong. It operates easily and noiselessly. It is set into the face of the door so that there are no projecting points to catch cleaning cloths and no surfaces on which dirt can collect.

SPECIFICATIONS—GENERAL

All metal cabinet work shall be manufactured and installed by the OLEAN METAL CABINET WORKS, INC., Olean, N. Y.

Steel

Steel shall be open hearth full pickled reannealed, resquared and oiled furniture stock free from pits, buckles and rust.

Not less than 20 gauge shall be allowed except in drawer bodies which shall be 24 in. and shelves, drawer slides and all other parts where strain occurs shall be of 18 gauge.

Hardware

Hardware shall be cast brass, chromium plated by an approved process providing for copper, nickel and double chrome plate. Hardware shall include hinges, knobs, handles, locks (3 and 1 point) and all other as detail or design may require.

Finish

Finish shall consist of following processes:

(1) All metal shall first be cleaned in a benzine solution (which solution shall be redistilled and cleaned after each dipping) to remove all grease, rust or other foreign matter.

(2) All metal to receive a coat of baking primer which shall be baked in electrically heated ovens to a temperature of 250° F. for two hours.

(3) All surfaces to be sanded thoroughly.

(4) A coat of surfacer to be applied and air dried for two hours.

(5) After which a filler shall be applied to fill all weld spots and other unevenness caused in fabrication.

(6) Surfacers and filler to be sanded to present smooth even bond surface for application of finish coats.

(7) Finish coats to be lacquer type, hand rubbed between coats and shall be applied in at least three coats or more as the pigment in the paint may require.

General Requirements

In addition to the general specification for gauge and hardware and finish the following shall be considered a part of the general requirements. All cases shall have mitered corners, which shall be welded and ground flush. Tops and sides shall be one piece construction. Bottoms shall be welded in, as shall back plates.

There shall be no projecting superimposed shelf brackets used—all shelves to be adjustable on 1/2 in. centers and to rest on supports in back of front stiles and cut out of back of cabinets. This construction insuring a smooth flush interior. There shall be no sharp edges of steel.

All doors shall be set in rebates and doors shall be 5/8 in. thick of heavy gauge construction—composed of a one piece drawn shape, to form the stile, into which shall be spot welded a seamless tubing, and to which the glass retainer strip shall be fastened by means of machine screws. Glass shall be set on wood strips or felt or rubber retainers.

Drawers shall be constructed with double heads and shall slide on channel suspension slide on the interior of the cabinet. The corresponding member on the drawer shall be integral with the drawer body and shall be of stainless steel in monel metal. Drawers shall be prevented from falling out when fully extended by means of a hidden catch. Screw heads shall be sunken into inside head of drawers. When drawers are heavily loaded provide suitable bumper on back of cabinet to release strain from head.

Where hollow construction doors occur, same shall be reinforced by means of channels spot welded to inside of inner pan, and the entire door to be electrically welded into one piece construction.

Hinges shall be sunken into the door stile and jamb and must not protrude more than 1/4 in. from the face of the cabinet. Hinge reinforcements shall be of bar iron 1 3/8 x 1/2 in. extending the entire length of the jamb and concealed.

All outer margins of cases to be not over 7/8 in. except in cases when units are to be set in walls when this is increased to 1 1/2 in.

HOSPITALS—THEIR EQUIPMENT AND LAYOUT**Experience**

Many years' experience has been fruitful in producing an attitude toward the planning of the modern hospital, which provides equipment meeting every need. The OLEAN METAL CABINET WORKS, INC., contributes to this efficient trend with metal casework embodying many unusual features. Distinctive in appearance, sturdy and accurate in construction, sanitary and easily cleaned, they have universal appeal. Those cases requiring mechanical or engineering skill in their conception have been designed by men of long experience and sound engineering ability. Their utility is assured by their repeated use in many of the largest institution and hospital projects.

The Olean Line Includes

Instrument cases, operating room cases, diet kitchens, serving kitchens, main kitchen. Cases in storage rooms, tray rooms, utility rooms, work rooms, sterilizing rooms, blanket warmers, bed pan warmers, specimen cases, viewing cases as well as the shelving and other units which must be adapted to the individual needs of the hospital.

The general specifications as outlined above apply except as follows:

Steel shall be 18 gauge and heavier as required

except drawer bodies which shall be of 22 gauge. Specification for steel as to quality shall be same as previous general specification.

Drawer slides shall be of monel metal or stainless steel. Where required, roller slides shall be used. Where drawers are heavily loaded or of extra depth, same shall be provided with stopping device at back of drawer to eliminate strain on drawer head.

The accompanying details of standard sections show the general types of work fabricated by OLEAN METAL CABINET WORKS, INC.

Types of construction and details thereof to follow as to size and type the standard sections previously illustrated.

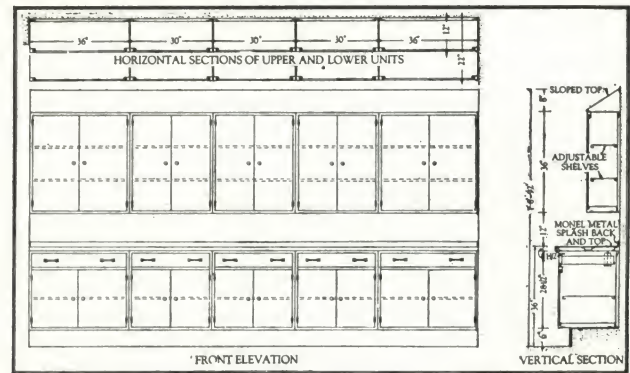

The line as here submitted includes a pot and pan closet, which we recommend strongly for use as a utility case in the hospital. It provides the maximum storage capacity with minimum space occupied, and is a place for everything in which everything has a place.

The hospital has long desired coved inner corners and the OLEAN METAL CABINET WORKS, INC., presents the new coved line—which can now be had at very small added cost. We can now supply the glazed door in stainless steel or monel metal, a feature which makes paint unnecessary.

LIST OF TYPICAL OLEAN INSTALLATIONS

Olean kitchen equipment gives lasting satisfaction because the designs are correct, because skilled Olean mechanics make all installations, and because the equipment is guaranteed for the life of the building. It is this enduring quality that has made Olean equipment the choice of so many homes and institutions where beauty and cleanliness are inseparable.

THE PARSONS COMPANY

603 Milwaukee Avenue, East, DETROIT, MICH.

Meets Present Day Requirements

We believe there is no combination of kitchen equipment that so admirably meets the present day requirements of small homes, apartments, apartment hotels and summer cottages as the Parsons "Pureaire" Kitchen.

It offers decided advantages to architect, builder and owner through savings in first cost, floor space, upkeep, and in attracting and holding tenants by providing increased comfort, convenience and cleanliness.

Open, it puts within arm's reach the complete equipment of a 6-ft. kitchen—full size stove, refrigerator, sink and ample storage space—all compactly arranged in a beautiful pressed steel cabinet that is fireproof, verminproof, easily cleaned and occupies a space less than 4 ft. in width.

Closed, it is an attractive piece of furniture with the entire kitchen out of sight. Its unique design and attractive colors harmonize with any decorative scheme, giving added charm and brightness, while the ventilation feature eliminates the discomfort of heat, smoke and cooking odors.

Save Three Ways

First—The Parsons "Pureaire" Kitchen is built entirely of steel; it is sanitary; it will last indefinitely, and it will reduce redecorating costs.

Second—Unique design, sound engineering and mass production make its price actually less than the same equipment bought in separate units.

Third—It effects a great saving in floor space, since similar equipment in multiple units requires 50% greater area. This saving of space may be utilized by enlarging the size of the rooms or increasing the number of apartments.

Modernize This Modern Way

The Parsons "Pureaire" Kitchen cannot be excelled for remodeling old apartments, hotels and residences into

kitchenette apartments. It may be set against the wall or recessed, eliminating partitions and folding doors. Through its use, with a minimum investment, empty apartments and hotel rooms can be turned into modern kitchenettes that will attract and hold tenants.

Specifications

Ventilation—A 11 smoke, heat, cooking odors and steam are carried upward through a 6-in. vent which is connected with the flue. The grilled panels beneath the burners and the sink admit sufficient air, which circulates upward, giving perfect ventilation.

Stove—A full size

PARSONS

Pureaire

KITCHEN

4-burner, with a 16-in. oven and broiler, triple wall properly insulated. Below the burners is a white porcelain enameled tray which is also used as a drainboard when placed over the burners.

Refrigerator—This is of all-steel construction, except for the maple frame around the door. The insulation, Dry-Zero, is one of the most efficient known to refrigeration science.

It is odorless, resists moisture, does not deteriorate, and reduces operating costs from 15% to 25%. The interior is finished in white enamel and equipped to take any standard electric refrigerating unit; or ice may be used as the refrigerant.

Sink—The sink, drainboard, back and side splashers are of fine white porcelain enamel, designed to take standard plumbing fixtures.

(Patented and Patents Pending)
Diagram Shows How Parsons "Pureaire" Kitchen Is Perfectly Ventilated

All heat, greasy smoke and cooking odors are carried up through a 6-in. vent connected with flue

Shelving and Drawer—There is a total of 20 sq. ft. of storage space. The utility drawer measures 20x20x4½ in., and has a padded compartment for cutlery.

Cabinet—The cabinet is scientifically constructed from heavy gauge furniture steel over cold rolled steel channel frame, acetylene welded. It is a rigid and solid unit. All parts are made in dies, standardized and uniform. Doors are hung with full length piano hinges, chromium plated.

Over-all Dimensions—80 in. high, 45¾ in. wide, and 22 in. deep.

Finish—The kitchen is beautifully finished in a special Jonquil Green and Ivory lacquer, striped in Persian Orange.

Weight—Net 400 lb. Crated 475 lb.

Note: The Parsons "Pureaire" Kitchen is also furnished with a standard electric stove.

KITCHEN MAID STANDARD UNIT SYSTEMS FOR KITCHENS

MANUFACTURED BY

Wasmuth-Endicott Company

ANDREWS, IND.

Products

Kitchen Maid Standard Units—Kitchen Cabinets, Kitchenette Assemblages, Refrigerators, Folding Ironing Boards, Linen Cupboards, Dish Closets, Wall Cupboards, Broom and Utility closets, Divider Cupboards, In-a-wall Chairs, Telephone Niches, Wardrobes.

General

The Kitchen Maid line embodies all the newest and most important units of kitchen equipment. Each is complete in itself—may be used alone or in combination with other units. These units will fit into practically any size of space in kitchens already built, or may be built into

Kitchen Maid combination made up (from left to right) of broom closet No. U-100, Kitchen Cabinet No. BK-36 and Butlery No. B-24 using a single porcelain table top, and Dish Cupboard No. D-102. Any of the other Kitchen Cabinets, Butlery Units or Side Units may be used. Total width of combination varies accordingly.

kitchens especially designed to receive them. The number of unit combinations is almost unlimited.

Kitchen Maid Units are built by specialists in kitchen equipment and represent the highest development of cabinet-making skill. They meet the architect's highest ideals. And, because of standardization and quantity production, the cost is less than built-in work of equal quality and completeness.

Corner combination consisting (from left to right) of full-depth Utility Cupboard No. U-200, Butlery Unit No. B-30, Corner Unit No. C-21, Butlery Unit No. B-301, and Dish Cupboard No. D-202. Any of the other Butlery Units, Kitchen Cabinets or Side Units may be used. Total width of combination varies accordingly.

General Description

The following specifications form a convenient, usable guide for the architect when he plans kitchens.

Materials—All units built of carefully selected, thoroughly seasoned, kiln-dried wood.

Front Frames—The 2" front frames allow doors to swing fully open. Full 1" thickness permits heavier joints.

Joining—All joints either mortised, dovetailed, or tenoned and carefully glued. Shelves mortised in.

Finish—Consists of two sprayed coats of undercoat and one sprayed coat of heavy oil-base satin enamel. Surface is carefully sanded and glazed after each coat.

Colors—Kitchen Maid Units are furnished in eight exclusive colors: Pastel Green, Dawn Gray, Travertine Ivory, Shasta White, Sunbronze Tan, Canary Yellow, Spanish Orchid, Horizon Blue. Each with tasteful decorations of contrasting colors.

Smooth Doors—Eliminate dust-collecting panels. 5-ply lumber core construction. Doors guaranteed not to warp or get out of line.

Rounded Inside Corners—All inside corners of Kitchen Maid Units are of rounded construction, leaving no square dirt-catching spaces.

Enameled Interior Bases—Always easy to clean and keep clean. Present a very attractive, finished appearance.

Table Top—Bolted Laminated Maple—practically indestructible.

General Description, Continued

Porcelain Table Tops—Kitchen Maid table tops are of vitreous porcelain. Guaranteed not to chip, crack, or become stained by common usage.

Hardware—All catches and strikes in Kitchen Maid Units are of cast brass chromium plated. Hinges of steel, chromium plated. Hinges are concealed—a patented feature.

Flour Bins—Made of heavy rustproof metal. Capacity 12½ lbs. Sifter attached to all bins.

Condiment Sets—Provide practical units for sugar, coffee, tea and spices. Made of sparkling glass.

Non-sag Shelves—All shelves in Kitchen Maid Units made of strong ¾" lumber, making sagging next to impossible.

Indestructible Drawers—Made of enameled heavy gauge steel with wood fronts. Exceptionally strong and rigid. One drawer in each cabinet is equipped with felt lining for silverware. All drawer pulls are of opalescent glass.

Refrigerators—All steel construction. Insulated with two inches of pressed Corkboard dipped in odorless asphalt and a ¾" dead air space. Doors are steel-clad with fine enamel finish. Linings are of galvanized iron, enameled in food compartments. Each box equipped with Universal hangers for cooling coil and mechanical refrigeration boring.

Packing—Units carefully cartoned and crated at factory. No shipment leaves until given a final inspection and found in perfect condition.

This is Kitchenette No. 7224. Neat, convenient and beautiful. So compact that everything is easily within reach. Occupies only 72" of wall space. Made up of Refrigerator No. R-2435, under sink enclosure, porcelain top cut out for flat rim sink, Kitchenette Base No. K-24, Wall Cabinets No. W-24 and No. W-024, range and hood. Dimensional drawing below.

At the left is shown a dimensional drawing of Kitchenette Assemblage No. 8430.

These assemblages may be varied in width by changing refrigerator section, sink section, or stove section in size by use of other standard units. Kitchenette Assemblages do not include sink nor faucets shown in illustration.

Complete Kitchen Maid Assemblage around the sink consisting (from left to right) of Compressor Case No. C-24, Refrigerator No. R-2449, Top Unit No. T-2413, Butlery Base No. B-24, Wall Cupboard No. W-3424, Sink Enclosure, Kitchen Cabinet Base No. BK-48, and Wall Cupboard No. W-3448. This installation has been equipped with Tile Table and Splash Back.

Telephone Niche

Telephone Niche. Built to fit into wall. Uses no floor space . . . Note comfortable seat. May be finished in Brown Mahogany or Walnut varnish; in Olive Green or Mandarin Red lacquer; or in two-tone Olive Green or Mandarin Red lacquer. Also available unfinished.

Kitchen Maid Divider Cabinets

Kitchen Maid Divider Cabinets offer practical arrangements for dividing kitchen and dinette. No. 63 (shown at right) is made with conventional panelled glass door. No. 62 made with panelled door decorated with carved wood design.

Kitchen Kraft Standard Units

This is a complete line of Lower Price Units distinguished by many of the features that have won favor for Kitchen Maid Units.

It offers the builder of lower priced homes or apartments the same adaptability of installation, remarkable compactness and convenient unit assembly that characterize the Kitchen Maid line.

Just as in Kitchen Maid, metal drawers, operating in metal slides, insure easy operation. Panel door construction is employed throughout. The units are finished in your choice of eight beautiful enamels.

PETERSON AND NEVILLE, INC.

Manufacturers of Pressed Steel Products for the Kitchen

365 Dorchester Avenue, BOSTON, MASS.

Product

"KLEEN KITCHEN" METAL FURNITURE: Cabinets, Sinks, Steam Tables, etc.

For "Steelweld" Door Frames and Hospital Cabinets, Tables, Furniture and Shelving, see Manufacturers' Index.

Custom Made Kitchen Furniture

We are pleased to submit designs, and estimates to architects' designs, for Kitchen furniture made of furniture steel, stainless steel and monel metal.

We specialize in custom-made work of the highest quality. We find that the most satisfactory steel kitchen architects' designs, for Kitchen furniture made of furniture steel is made for each individual project. Our cabinet work is of extra heavy gauge metal; doors are double thickness, welded, hung usually with flush concealed hinges; all drawer fronts are of similar double construction that insure quiet closing and eliminate tinny, metallic sounds.

Kleen Kitchen

Kompact and Komplete Models—

We manufacture these in several sizes, consisting of refrigerator, gas or electric stove, sink and storage cabinets. Specifications, sheets and prices will be sent on request. These cabinets can be designed to take any type of refrigerator unit or we can furnish a refrigerating unit designed and built into these cabinets.
